This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world’s books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that’s often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book’s long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ **Make non-commercial use of the files** We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ **Refrain from automated querying** Do not send automated queries of any sort to Google’s system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ **Maintain attribution** The Google “watermark” you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ **Keep it legal** Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can’t offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book’s appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google’s mission is to organize the world’s information and to make it universally accessible and useful. Google Book Search helps readers discover the world’s books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at [http://books.google.com/](http://books.google.com/)

HABENARIA, a genus of plants belonging to the natural order Orchideæ. The tribe has a ringed hooded perianth, a 3-lobed entire spurred lip. There are three species natives of Great Britain.

Habenaria viridisa, the Frog Orchis, has a very short 2-lobed spur, linear 5-pointed lip, the middle point the shortest. The flower is green, and the lip of a brownish colour. It is the Peristylus of Lindley, and the Himantoglossum of Reinwardt. It grows in woods and thickets.

H. biflora, the Lesser Butterfly Orchis, is distinguished by the lip being linear and entire, and the pollen masses parallel. The flowers are white. It is found in heathy places.

H. chlorantha, the Great Butterfly Orchis, has the same general characters as the preceding species; but the flowers are larger and the plant is taller and stouter. The pollen masses ascend obliquely and converge upwards. It grows in moist woods and thickets.

(Babington, Manual of British Botany.)

HABINGTON, WILLIAM, was the son of Thomas Habington, a Roman Catholic gentleman of family and fortune in Worcestershire. His mother, the daughter of Lord Morley, has been supposed to have been the writer of the famous letter which revealed the Gunpowder Plot [Fawkes, G. P. C.]; and her husband (who had been long imprisoned as implicated in Babington's conspiracy) gave shelter to some of the accomplices of Fawkes, and was sentenced to die, but received a pardon through the intercession of his wife's brother, on condition of retiring to his manor of Hindlip. Their son had been born there on the very day now marked as the date of the plot, the 5th of November, 1605. He was educated in the Jesuit college of St. Omer, and afterwards at Paris; and endeavours were used, but in vain, to induce him to enter the society. He returned to England, and lived in retirement with his father, who long survived him, and who directed and cooperated with him in historical and other studies. William Habington married Lucy, daughter of William Herbert, the first Lord Powis; and the whole of his subsequent life appears to have been spent in literary and rural quiet. It is said by Anthony Wood that he "did run with the times, and was not unknown to Oliver the Usurper," a charge which may either be untrue or involve nothing discreditable. He died at Hindlip on the 19th of November, 1644, when he had but just completed his fortieth year. His published writings were the following:—1. "Castara," a collection of poems, first printed together in 1655, and again more fully and correctly in 1659. They were included in Chatterton's English Poets in 1810, were reprinted separately in 1812, and are given wholly in Southey's "Select Works of the British Poets." The name at the head of them is the poetical one he gave to the lady whom he married. They are in three parts: the first containing sonnets and other small pieces, chiefly addressed to his mistress before marriage; the second part containing similar poems, chiefly addressed to her as his wife; and the pieces in the third being mainly religious and contemplative. 2. "The Queen of Arragon, a Tragi-Comedy," acted both at court and at the Blackfriars theatre against the author's will, printed in 1640, folio, brought again upon the stage in 1666, with a prologue and epilogue by the author of Hudibras, and reprinted in all the three editions of Dodson's "Old Plays." 3. "The History of Edward IV." 1646, folio, said to have been partly written by his father. 4. "Observations upon History," 1641, 8vo.

Habington's poems, although infected by the tendency to puerile and absurd conceit which prevailed in his time, are yet in most parts exceedingly delightful. Their fancy is sweet, especially in rural description; their feeling is refined and ideal; the language is correct and tasteful; and the tone of moral sentiment is everywhere pure and elevated. The romantic and chivalrous cast of thought and sentiment gives much interest to his play, although the story is meagre, and the characters are not vigorously depicted.

HABZELLA, a genus of plants belonging to the natural order Annonaceae. It has a 3-lobed calyx; 6 petals, the inner ones smallest; the stamens very numerous; the torus convex; the carpels distinct, indefinite in number, long, cylindrical, obliquely ventricose or torulose, smooth, striated longitudinally, becoming many-celled by the pericarp growing together; many-seeded, the seeds elliptical, arilate, somewhat erect, numerous, shining, one in each of the cells of the ovary; the acicula formed of 2 white unequal obcordate membranes.

H. Ethiopica has ovate-acute leaves, 3 inches long, 12 to 14 lines broad, smooth on the upper surface, and downy beneath; the carpels are pod-shaped, 1-3 inches long, knotted, striated, quite smooth, with the taste of pepper. The fruit has a pungent aromatic taste, and is often substituted for other spices. It is the Piper Ethiopicum of the shops, and the Nuova Ethicoth of Duval and other botanists. It is a native of Sierra Leone. H. aromatica is another species, yielding a pungent aromatic fruit. It grows in the forests of Guyana, and the fruit is used by the negroes as a condiment. (Lindley, Flora Moderna.)

HACKERT, PHILIPP, a celebrated German landscape painter, was born at Prenzlau in Prussia, in 1737. His father was a portrait painter and a native of Berlin, where Hackert spent some time with an uncle who was a decorative painter. He acquired his chief knowledge of painting, however, by copying good pictures; and he derived great benefit also from the acquaintance of Le Sueur, the director of the Berlin Academy, and of Sulzer. In 1765 he visited Paris, and in 1768 went, with his brother Johann, to Italy. They spent some time in Rome sketching and painting the scenery about Albano and Tivoli; many of their works were purchased by Lord Exeter. Philipp's first works of importance however were the six large pictures of the Russian

VOL. II.—B
naval victory of Tchefesme, and the burning of the Turkish fleet, by Count Orlov, in 1770, painted for the empress Catherine II. of Russia, and for which he was paid 20,000 zecchini, about 16,000 florins, to whom the works were sent at Leghorn, was upon the whole highly gratified by their successful accomplishment, but he was totally unsatisfied with the representation of the explosion of a ship, in the picture of the burning of the fleet; and in order to give the artist a proper impression of such a catastrophe, he ordered, with a spirit worthy of an autocrat, one of the frigates of his fleet, an old vessel, to be blown up in the presence of Hackert, in the roads of Leghorn, and he was well satisfied with the results of his experiment, for Hackert greatly improved the picture. These works, with six other similar subjects, were exhibited at St. Petersburgh, the year in which the first-mentioned pictures were completed, Johann Hackert died at Bath, aged only twenty-nine; he came to England with some pictures which had been ordered by English travellers for home, his brothers, Wilhelm and Karl, joined Philip in Rome, but Wilhelm went shortly afterwards to St. Petersburgh, and died there in 1780, aged only thirty-two, and Karl settled in Switzerland. Philip accordingly set out for his youngest brother Georg, who was an engraver at Berlin, and they lived together from that time until the death of Georg at Florence in 1795.

Hackert was highly patronised in Rome both by Italians and foreigners; Pius VI. was delighted with his works, and his reputation as a landscape painter was unrivalled by any of his contemporaries, although he was a pupil of Wilson, who was not received nor known at that time: Wilson left Rome in 1755. In 1777 Hackert made a tour in Sicily with Richard Payne Knight and Charles Gore; and in 1778 to the north of Italy with Charles Gore and his family. In 1782 he went to Naples and was presented to the king, Ferdinand IV., by the Russian ambassador, Count Rassamunovsky. The king took great pleasure in the pictures of Hackert, and treated him with great kindness and familiarity; he used to style him Don Filippo. In 1786, after the departure of Count Rassamunovsky, he appointed Hackert his preferred painter, who settled with his brothers from that time in Naples. They had apartments in the Palazzo Francavilla on the Chiaja, where they occupied until they were dismissed by General Rey, the French commandant in Naples, in 1789, who took possession of them himself; he however treated the Hackerts with great kindness, gave them passports, and suffered them to depart with all their goods and chattels, with which they arrived safely at Leghorn, and treated him with great kindness and familiarity; he used to style him Don Filippo. In 1786, after the departure of Count Rassamunovsky, he appointed Hackert his preferred painter, who settled with his brothers from that time in Naples. They had apartments in the Palazzo Francavilla on the Chiaja, where they occupied until they were dismissed by General Rey, the French commandant in Naples in 1789, who took possession of them himself; he however treated the Hackerts with great kindness, gave them passports, and suffered them to depart with all their goods and chattels, with which they arrived safely at Leghorn, and there he was welcomed both in Naples and at Caserta. In 1787 Hackert painted a large picture of the Battle of the Parthenope, 64, the first ship of war which was built for Naples; it was engraved and published by his brother Georg, who painted five other large pictures of Neapolitan seascapes, which were all enlivened by some historical scene of interest; they are in the palace at Caserta. In 1788 the king appeared in Leghorn on a state visit, and Hackert was presented with a bottle of champagne on that coast, which he painted, from Manfredonia to Taranto. In 1790 he visited on a similar mission the coasts of Calabria and Sicily, and the king gave him several connoisseurs, a swappiana, and two cabinet makers for twelve months for the express purpose; he was out about five months, from April to August inclusive.

Hackert lived, after his departure from Naples in 1799, a short time in Leghorn, whence he removed to Florence, where he resided in a villa which he purchased in 1803, until his death in April, 1807.

Hackert's works are not remarkable for any particular quality of art: they are simple portraits or prospects in ordinary light and shade, and their beauty accordingly depends upon the local beauty of the scene. The detail is careful, without being minute, and where a momentary air of any particular scene is the chief object of desire, his works are calculated to give perhaps complete satisfaction, except in the case of some fastidious connoisseur who might require a bolder and more artistic foreground than those which characterise his works generally. His drawings are extremely numerous, and his paintings are not rare; many of them have been engraved. He painted in oil, in mezzotint, and in water-colours on a warm ground, and in a species of tempera. He also etched several plates.

Goethe has written a eulogistic Life of Hackert, whose close intimacy of nature delighted the German critic, and he has extolled him beyond his merits; while he compares Flaxman with Salatelli, and damn his noble designs with the faint praise that they have some pretty ideas in them; he concludes thus in the deriding of Count Orlov, (Goethe, Werke—Philipp Hackert; and Winkelmann und sein Jahrhundert.)

HAC (in italics). The derivation of the word Hackney, as applied to a class of public conveyances, has occasioned much speculation. Bailey, in his Dictionary, adopts what appears to have become a popular notion, that the name is derived from the suburb of London so called, for which supposition however we find no plausible ground; but he adds, 'unless you would rather have it from the French Hackney'; this is a word of similar meaning. Many other conjectures are made, 'from Johnson's Dictionary,' and in the lexicographical division of the 'Encyclopædia Metropolitana.' From these it is evident that a similar word is found in most European languages. Regulated fares, calculated form, time by time or distance, and, thus: -equus, okus, aquis, akiness, aikens, haquens. Another conjecture derives it from an Anglo-Saxon word meaning to neigh, on the supposition that a lively horse, given to neighing, would be the most likely to be hired for hire. Perhaps the most probable derivation is from hague, an old French word for a gelding, which would be a finer and more spirited horse for hire than any other; but this may be, it is sufficiently evident that the term hackney was first applied to horses let for hire, and then, by a very natural transition, extended to coaches, and subsequently to sedan-chairs and certain other devices for hire, and that it is applied to all those forms of carriage which perform a certain specific journey, at a specified time, carrying passengers only in the line of its specified route, at a certain fare (which is not regulated by act of parliament), for each individual passenger, the sole privilege of being usually, though not invariably, dependent upon distance. So far as can be gathered from such notices as the writer has met with, this class of public vehicles appears to have originated in London before the period when the centres of metropolitan life were beginning to extend outside the metropolis, and the convenience of such a vehicle was greatly increased by a reduction in the number of horses with which it was harnessed. They are calculated for conveyance of six or eight persons, together with luggage, and to perform a certain specified journey, at a specified time, carrying passengers only in the line of its specified route, at a certain fare (which is not regulated by act of parliament); for each individual passenger, the sole privilege of being usually, though not invariably, dependent upon distance. issued to the master of the horse in 1637 to grant licences to fifty hackney-coachmen in and about London and Westminster, and as many others as might be needful in other places in England, the number of horses not being reduced to more than twelve horses. In 1652 the number of hackney-coaches daily plying in the streets was limited to 200; in 1654 it was increased to 300, allowing however only 600 horses; in 1651 to 400; and in 1654 to 700. By an act of the last year of Anne (c. 23) the number was to be increased to 800 on the expiration, in 1715, of the licences then in force, and 200 hackney-coaches were also licensed. The number of chairs was then increased to 800 on the same act. In 1717, the act 12 Geo. 1. c. 15, was repealed. In 1771 the number of coaches was further increased to 1000.

Now, notwithstanding this steady increase in the use of hackney-coaches, they were long assailed as public nuisances in a way which it is amusing to look back upon. Some curious details on this subject are given in Knight's 'London,' vol. i. p. 97, &c., from which it appears, by a quotation from a letter of Garrard, that the first hackney-coach stand was established in 1854, by one Captain Baily, at the May-pole in the Strand. Even so late as 1860 Charles II. issued a proclamation against hackney-coaches standing in the streets to be hired; but on the very day it was to come into force, Pepys records that he got one to carry him home. The monopoly long enjoyed by the London hackney-coachmen produced great difference to the increasing use of such conveyances. In 1823, while that monopoly was undisturbed, hackney-coaches appear to have sunk lower and lower in the scale of efficiency. For some two hundred years, observers Mr. R. H. M. Bury has found, the drivers of these red-coated hired carriages had seen the hackney-coach passing through all its phases of dirt and discomfort; the springs growing weaker, the 'iron ladder' by which we got in and out, the rickety body, the smoke-stained hemp and straw, the fiendish cushion more redolent of dismal smells, the glasses less air-tight. So slow, also, were their movements, that it was almost hopeless to think of gaining time by riding in them.

While this was the state of things in London, a lighter kind of vehicle, drawn by one horse, had been brought into extensive use in Paris. In the year 1818, according to a paper on the 'Vehicular Statistics of London,' in No. 78, new series, of 'Chambers's Edinburgh Journal' (to which we are indebted for many of the following particulars), there were no less than 1150 of these vehicles, which were called cabriolets de place. Efforts were made to introduce similar vehicles into this country, but, owing to a regard for the 'vested rights' of the hackney-coach owners, it was long impossible to get licences for them. Were they not difficult Debours. Broth- shaw and Rotch (the latter a member of parliament) obtained licences for eight cabriolets in 1823, and started them at fares one shilling less than those of hackney-coachmen. The new vehicles were horse-chaises, drawn by a horse, and carrying only one passenger besides the driver, who sat in the cabriolet (or, as more commonly called for brevity, the cab), with a window on either side of the coach, the whole of which room was provided for a second passenger, and the driver was separated from the fare; and with the rapid extension of this lighter class of vehicles, numerous varieties of construction have been introduced, in most of which the original model is completely lost sight of, but in which comfortable and safe accommodation, with complete shelter from the weather and separation from the driver, is provided for two, three, or, in a few cases, four. The name 'cab' is still commonly applied to all hackney-cabriolets drawn by one horse, whether on two or four wheels. During the first few years of the employment of such carriages their number was restricted to sixty-five, while the number of coach-licences was increased to twelve hundred; but in 1832 all restriction as to the number of hackney-cabriolets was removed, and in the paper above referred to it is stated, on the authority of information received from the registrar of hackney-carriage licences, that the number of hackney-cabriolets licensed for use during the year ending January 4, 1846, was 2450, all of which were coach-like in appearance; there were also 581 one-horse vehicles. The number of drivers licensed during the year ending May 14, 1844, was 4927, besides 371 'watermen,' or attendants upon the 130 regular metropolitan coachstands.

While the changes above noticed have greatly benefited the public, there is reason to fear that the great increase of accommodation has not been accompanied by any elevation of moral character in the large class of men engaged in this business. Since the year 1822 hackney-carriage drivers have been required to deposit any articles which may be accidentally left in their vehicle, and no licence to an hackney-coach to whom the owners of the lost property may apply for its restoration, upon paying for the driver's time and trouble; and, incredibly as it may appear, the estimated value of the property thus taken to the Treasury has been considerable. In the first four years of the introduction of this rule is estimated at 45,000L., while very few applications were made for property which was not thus restored. Of late years however the case has been very different, for which reason the board of trade, under the introduction of this rule is estimated at 45,000L., while very few applications were made for property which was not thus restored. Of late years however the case has been very different, for which reason the board of trade, under the introduction of this rule is estimated at 45,000L., while very few applications were made for property which was not thus restored. Of late years however the case has been very different, for which reason the board of trade, under the introduction of this rule is estimated at 45,000L., while very few applications were made for property which was not thus restored.
are of a green colour, and Kotsch and others on this account have proposed the name Microcystis for this genus of plants.

The species are found upon moist rocks, on the walls of caverns, and in damp places. Mr. Hassall has recently described several new species of this genus; they belong however to a genus in which it is difficult to discover permanent specific characters. [Red Snow, P. C.]

Hassall, British Frightenater Algae.

AECUTICO COMBENDRED, WRIT DE. (HERBERT, P. C. S.)

HAGUE, ALLIANCE OF THE. As the general war which was terminated by the Peace of Ryswick in 1697 (P. C.) preceded by what is called the First Grand Alliance, concluded at Vienna between the Emperor and the United Provinces, 12th May, 1689, and joined by Great Britain 9th December following, so the next general war, which broke out in 1702, was preceded by the Second Grand Alliance, or Alliance of the Hague, concluded at that town between the Emperor, Great Britain, and the United Provinces, 7th September, 1701, and subsequently joined by Portugal and other European powers. Its object was to resist the seizure of the Spanish crown by the French king Louis XIV. for his grandson the Duke of Anjou, who nevertheless eventually became King of Spain, by the title of Charles III. The Alliance of the Hague was the last political combination arranged by William III. of England, who died 8th March, 1702; and war was declared against France by Queen Anne 4th May following. [Partition Treaties, P. C., xvii. 292.]

HAGUE, SAMUEL, found of Leiden. He discovered that the system of medicine called Homeopathy, was born at Meissen, in Upper Saxony, on the 10th April, 1755. His father, Gottfried Hahnemann, who was an artist of considerable merit, was employed in the manufacture of China in the extraordinary factory of the iron and porcelain manufactories of Meissen. He was a clever well- educated man, and to him his son owed the first sediments of his education. He was afterwards placed at an elementary school, the director of which, with the remarkable talents that only required cultivation to raise the boy to eminence, persuaded his father to place him at the High School of Meissen, into which they obtained for him a free admittance. Hahnemann gladly availed himself of these increased facilities; he made himself master of Latin, Greek, and Hebrew, and evinced a decided bias for the study of the physical sciences, natural history, and medicine. Botany was also a favourite pursuit, and his hours of leisure were devoted to the collection of plants and their systematic arrangement. His intense application and amiable disposition won the goodwill of the head master and teachers, who vied with each other in affording him every facility in the prosecution of his studies; and his progress was so rapid, that in a short time he was appointed an assistant teacher.

He was of medicine for his profession, at the commencement of 1775 he left the high school of Meissen, and, assisted by the friendship of his former teachers, he entered the University of Leipzig, having, as a candidate, written a Latin dissertation on the distinction of the qualities of life. 1758, p. 122.

Being wholly dependent upon his own exertions for subsistence, he supported himself during his residence at Leipzig by giving lessons in German to foreign students and by the translation of English and French medical authors. The professors of the University, in admiration of his ardent zeal for knowledge and great acquirements, invited him to attend their lectures gratuitous. Having passed two years in the study of the theory of medicine, and saved a small sum of money, he departed for Vienna, there being no clinical lecturer in the University of Leipzig and entered himself at the Hospital of Charitiable Brothers, with a view to the completion of his knowledge and to acquiring a practical knowledge of his profession.

His moderate pecunary resources were almost exhausted, when his talents and marked attention to his duties gained for him the esteem and attachment in which it is singular that, after a long residence in the corners of Siebenbürgen, then residing at Herrmannstadt.

He remained here for two years, and being allowed to attend private practice he saved a small sum of money; with this he removed to Leipsic, 10th of August 1779, he took his degree of M.D., and produced his thesis 'Conspicuous Adflectum Spasmodicorum Etiologicum et Therapeutics.'

In the year 1781 he was appointed district physician at

Gomern, near Magdeburg, where he married the daughter of an apothecary named Köhler. Previous to this he had resided some time at Hettstadt and Dessau, diligently pursuing, in addition to his professional labours, the studies of chemistry and mineralogy.

In the year 1784 he removed to Dresden, where he gained a high reputation in the hospitals as a judicious and skilful practitioner, but, struck with the absence of a guiding principle in therapeutics, and the great uncertainty of the healing art, he gradually withdrew himself as much as possible from practice, and endeavoured to support his family by his old resource of translations of English and French medical authors, by the reading of which he continued pursuing at the same time his favourite study of chemistry.

His feelings at this period are best explained in his own words in a letter to the celebrated Hufeland, written many years after he had founded the system with which his name is now so intimately connected. 'Eighteen years have elapsed since I quitted the beaten path in medicine. It was agony to me to walk in darkness, with no other light than could be derived from books, when I had to heal the sick, and to prescribe, according to such or such an hypothesis concerning disease, substances which owe their place in the Materia Medica to an arbitrary decision. I could not conscientiously trust to the conditions of my suffering brethren by these unknown medicines, which being very active substances, may, unless applied with the most rigorous exactness (which the physician cannot exercise, because their effects are not known), destroy health, and possibly produce death, or produce new affections or chronic maladies often more difficult to remove than the original disease. That I might no longer incur the risk of doing injury, I engaged exclusively in teaching, giving up practice in 1784.'

About this time he published his pamphlets on Mercurius Solubilis; on the mode of detecting Adulterations in Wine; on Calculus Sulphuratus; and on the Detection of Arsenic in Meat, with which he contributed to Crel's 'Chemical Annals,' and gave to the world a number of minor medical works, which have since been collected by Dr. Stumpf, and published under the title of 'Kleine Schriften,' Dresden and Leipzig, 1829.

In the year 1790, while engaged upon the translation of the 'Materia Medica' of Cullen, he was struck with the different explanations given of the mode of operation of Peruvian Bark, in intermittent fever: and dissatisfied with them, he determined to try its effects upon himself. Finding that powerful doses of this substance produced symptoms strikingly analogous to those of that fever, he endeavoured to establish the idea that it was an acknowledged specific, he determined to try further experiments with other medicinal substances upon himself and upon some medical friends. He obtained similar results: and so by these agents he was enabled to state that there exist disorders resembling the diseases of which they were esteemed curative; and thus, the first dawn of the law of Similia Similibus gleamed upon him. In a work ascribed to Hippocrates, Ed. Bar. 1737, p. 127, he quotes the words: 'Curatur simile similibus,' and he explained his discovery: and the same doctrine has since found advocates in many eminent medical writers; but Hahnemann was the first who assumed it to be the guiding principle in Therapeutics, and supported his position by a series of experimental demonstrations. Confident that he had discovered the long sought for law, he assiduously pursued his proving of medicines, and adopted the new principle in the treatment of his patients with (according to his own testimony and that of his disciples) a success fully commensurate with the limited means then at his disposal. Thus encouraged, he ventured, in 1796, to address a paper to Hufeland's 'Journal,' in which he announced his new discoveries in medical science and endeavoured to point out the defects of the 'Materia Medica' as then constituted, and the necessity of its reconstruction upon the basis of pure experiment; at the same time he earnestly invited the cooperation of his fellow physicians. To the Germans this appeal was not immediately heard; but the German physicians were then deeply engaged in the investigation of the Bruennonian theory, and Hahnemann's suggestions were coldly received.

In 1801 he published a short treatise on the efficacy of Belladonna for the prevention and cure of scarlet fever, and affirmed that its curative properties were based upon the homoeopathic law. In 1805 he published the results of a number of experiments in a work entitled 'Fragmenta de Viribus Medicamentorum positivis, aevi obvivis in Corpore Sano,' and in the same year his 'Medicinae Experience,' in which he still more strongly expresses his objection to the old system of medicine. In 1810 he broug
out his great work, the 'Organon of the Healing Art,' in which he gave, in a remarkable form, the Systems of medicine; and for the first time gave it the name of 'Homoeopathy,' by which it has since been distinguished. [Homoeopathia, P.C.S.] In 1811 the first part of the 'Materia Medica Pura' was published, by whom a number of substances till then not fully completed in the year 1821, since which time five editions have been published.

In the year 1812 he returned to Leipzig, where he was appointed Magister Legum. To prove his qualifications for this chair, he wrote an excellent treatise on the heliobole of the anterior, 'Dissertatio historico-medica de Heliochorismo Veterum.' At Leipzig he had an extensive practice, and was assisted by a great number of his pupils, proving the excellency of his medicines. The apothecaries of that city, however, rose against him, and appealing to an old law long dormant, that forbade a physician to dispense his own prescription, he was succeeded in 1820 in obtaining a decision in their favour. Hahnemann, unwilling to risk his own reputation and that of his system upon medicines prepared and dispensed by individuals avowedly hostile to his medicine, had determined to retire from practice, when the Duke of Anhalt Cöthen offered him an asylum in his dominions, with the enjoyment of those privileges of which he had so much need of the support of his patients. For Cöthen, in the year 1828, that he published in four volumes his work on 'Chronic Diseases, their Peculiar Nature, and Homoeopathic Cure.' In the year 1829 the disciples and admirers of Hahnemann in that city struck a new system, and marked their attachment to the new system and their esteem for its founder. It bore on the face the head of Hahnemann, with the inscription, 'Samuel Hahnemann natus Mienae p. x. Aprilis. MDCCCLXX.' His adherents at this time were, 'Similla Simillibus;' the inscription, 'Medicinæ Homoeopathicae Auctori, Discipuli, et Amici, p. x. Augusti MDCCCLXX.' His adherents at the end of his life were, 'In memoriam Hahnemann. \textit{Medicinae Ac nostrae causa, patria,} in sua parte, haec praebet.'

Hahnemann has been a widower for some years, he married in 1835 a French lady, Melanie de Herelle, who had visited Cöthen for the benefit of his advice, and at her desire he removed to Paris. In commemoration of his marriage in the French capital, an admirably executed medal by David was struck, in bronze, silver, and gold, bearing on its face the head of Hahnemann, with the inscription 'Samuel Hahnemann.' On the reverse, in the centre 'Similla Simillibus curatur,' engraved by a snake; the inscription, 'Les Homoeopathistes Francais à leur Maitre. Né à Meissen le 10 Avril, 1755, Venu en France le 25 Juin, 1833.' He remained at Paris in the active exercise of his profession, and surrounded by numerous friends of his system, of all ages, from the time of his decease, which took place on the 2nd July, 1843, in the eighty-ninth year of his age.

Hail. [Snow, P. C., p. 160, col. 2] The principle of insurance has been recently applied to indemnify persons for the very heavy losses sometimes occasioned by these meteorological phenomena, both by the Royal Farmers' and General Insurance Institution and by a society connected with the Norwich Union Insurance Company. The uncertainty which exists in reference to the occurrence of these frequently calamitous storms in any particular locality, and the circumstance that, while no human sagacity can foresee or prevent them, it is utterly impossible to produce them by fraud, appear to render such casualties peculiarly fit, so soon as observation and experiment shall have enabled us to predict accurately the average risk, for the application of a principle which has long been applied to casualties of a nature less uncertain, more easily provided against, and which afford greater opportunities for deceit and imposition. The Hail-storm Insurance societies have published chronological lists of the most remarkable hail-storms in this country during the present century, which present an array of destructive calamities far exceeding what might have been expected from their rarity. It is curious also to observe that they appear to have increased in frequency of late years. In one case, which we select solely from the more circumstantial way in which the details are given, many farms of considerable extent, &c., were destroyed in the parishes of Hertford, Middlesex, and Essex; the damage done upon a space of 3487 acres in the last-mentioned county alone was estimated at 14,574l., or about 4fl. 7s. 7d. per acre, upon an average. It is stated that this was the third time within a period of thirty years that the crops in the northwestern part of that county had been destroyed in like way. During the great hail-storms in the months of July and August, 1843, by which immense damage was done in Cambridgeshire, Norfolk, Suffolk, Essex, Hertfordshire, Berkshire, Kent, Oxfordshire, Gloucestershire, and Yorkshire, several cases of individual loss amounted to upwards of 2000l. The breakage of glasses in windows and skylights, and especially in conservatories and bothies, is one of the most frequent injuries sustained by the latter, the masses of ice which fall becoming sometimes sufficient to demolish the wooden framework also. Such extraordinary cases of devastation will be fully accounted for if it be considered that, as it is stated in a paper issued by the Farmers' Insurance Institution, on the authority of 'Leslie's Elements,' hailstones having a diameter of two inches, a size which has been exceeded in several well-authenticated cases, will fall with a velocity of 1154 feet in a second, or more than 44 mile in a minute. On the 19th of May, 1809, it is estimated that 200,000 panes of glass were broken in London alone, besides great damage being done in fields and gardens, and the foliage and branches of trees being cut off. An equal number of panes is supposed to have been broken in the northern suburbs of the metropolis on the 30th of July, 1826. Hailstorms of from six to the sees, and severe storms of the above-mentioned description, are frequently mentioned as having fallen in this country, if the lists referred to, which are compiled from contemporary publications; and on the 3rd of August, 1824, when the eastern part of Suffolk was visited by a violent hail-storm, by which hails, fowls and game, as well as glass and crops, were extensively destroyed, the ice accumulated in some places to a surprising depth. In many cases a considerable extent of ground has been covered to the thickness of several inches. It is worthy of remark how very large a proportion of the destructive storms recorded have occurred in the months of June and July. Without noticing the cases in which two or more storms which occurred on the same day are alluded to as one, which would render this proportion yet more remarkable, the cases recorded in the above-mentioned lists are as follows. We have, of course, taken care to but once those storms of which two separate accounts are given—

In the article 'Hail,' in Brande's Dictionary of Literature, Science, and Art, are some curious facts collected from various sources, from which it appears that hailstones have been found weighing from five to twelve or thirteen ounces, and of all sizes up to about fourteen inches in circumference; the largest being frequently of very rugged and irregular form, resembling portions of a great sheet of ice broken to pieces rather than balls of ice. 'Hail,' according to this authority, 'usually precedes storms of rain, sometimes accompanies, but never or very rarely falls in storms of rain without an equal extent of hailstones of such size as to be larger than balls of ice.' Hail is said to be always accompanied with electrical phenomena, and it is generally believed that such are the preliminary effects of its formation. The particulars of hail-storms published by the Farmers' Insurance Institution, which gives references to authorities, and in many cases minute details of the damage done, appeared in the advertising sheet of the 'Farmers' Almanac' for 1845.
HAL

HALFORD, SIR HENRY, was born on the 2nd of October, 1766, and was the son of Dr. James Vaughan, physician to the Infirmary at Lancaster, and author of "Observations on Hydrophobia, on the Casuarina Section, and on the Effects of Cantharides in Paralytic Affections." Sir Henry received his education at Cambridge, and was afterwards admitted at Christ Church, Oxford; he graduated in medicine at Oxford in 1794, and was elected a fellow of the College of Physicians in the same year. Having been well introduced to London society, and being distinguished for the elegance of his manners, and having early married a daughter of Lord St. John, it was not long before his practice became considerable. He was appointed by George III., one of his physicians, and in 1798 had the good fortune by the death of his mother's cousin, Sir Charles Halford, and changed his name from Vaughan to Halford. He was made a baronet in the same year. Sir Henry continued to hold the office of physician to George III. till the king's death, and subsequently held the same appointment under George IV., William IV., and Victoria I. He was appointed president of the College of Physicians in 1824, and delivered the oration on the occasion that body receiving from their old building in the City to the new one in Pall Mall.

During his professional career Sir Henry was too much occupied with the kind of practice to which his early connexions in life introduced him, to contribute much valuable information to the literature of his profession. His publications consist of" Estimations of the Average Price of the Different Sorts of Beef and Mutton," before the college, and are written in Latin, and exhibit a purity of style beyond the average of such productions at the present day. His essays are as follows: 1. On the Cite. 2. On the Articulatic. 3. On the Estimation of Symptoms in the last Stages of Some Diseases. 8. On the Tis Doulouрез. 4. On Shakespeare's Test of Insanity. 6. On the Influence of Some Diseases of the Body on the Mind. 6. On the Laws of Articulation. 7. On the Treatment of Gout. 8. On Phlegmias Doloris. 9. On the Treatment of Insanity. 10. On the Death of some Illustrious Persons of Antiquity. 11. On the Education of a University Boy. In 1809 he published a collection of essays and papers displaying the elegant scholar and observant physician, and are mostly written in an easy graceful style. In 1813 Sir Henry Halford descended with the Prince Regent into the royal vaults of St. George's Chapel, Windsor, where, amongst other curiosities, they discovered the head of Charles I. Of this visit and discovery Sir Henry has given an account, which is deposited in the British Museum, and is authenticated by the signature of the Prince Regent. He died on the 9th of March, 1844. He had been for more than twenty years president of the College of Physicians, and was an instrumental in forming the evening meetings of that body. His urbanity of manners and devotion to the interests of the college have left behind them a grateful recollection amongst the members of that corporation.

(Pettigrew, Portraits and Memoirs of Medical Men; Transactions of Medical and Surgical Association, vol. I.)

HALIFAX, GEORGE MONTAGU, EARL OF, was the fourth son of the first Duke of Grafton. He was born at Stone, in Southamployshire, who was the eldest daughter of married in 1641, on this account. He was appointed to the king's chamber in 1661, and was eventually sent to Westminster School, where he was chosen a king's scholar in 1677, and whence he in 1682 was removed to Trinity College, Cambridge. He had distinguished himself, while a pupil of Bubb's at West- minster, by his extraordinary good fortune and skill in dealing with the top of his fingers, and these qualities of talent served itself in a way to attract wider attention in an obituary of English verse which he produced on the Death of Charles II., in February, 1685, beginning (not at all in just or satire)" in The same strain till at last the poet exclaims:" in Charles, so good a man and king, we see April, 1681."

This performance, we are told, so charmed the Earl of Dorset that he induced the young poet to come up to town, where he was introduced by his lordship to all the wits of his acquaintance. In 1687 he and Prior brought out in conjunction their surlesque upon Dryden's "Hind and Panther," entitled "The Hind and the Panther transverse to the Story of the Country fried a chronicle; and proceeding in the same strain till at last the poet exclaims:"

Mouse and the City Mouse. ' It is for the greater part a dialogue in prose, apparently in imitation of the Duke of Buckingham's 'Rehearsal,' with the parody in verse of Shakespearian and Jonsonian interludes. The parts of it are said to be Prior's, as may very well be believed; it is not, however, printed in the common collections of his poetry; but it must be a joke does not work in the "Modern Poets" (1750), vol. i. pp. 47-82, under the head of 'Additions to the Works of the Earl of Halifax.'

Montagu appears to have some time before this entered upon the love of poetry, by stating in the very title of the 'Works of the Poets,' merely says that he signed the invitation to the Prince of Orange, and sat in the convention; but his signing the invitation to the Prince would seem to imply that he had occupied some public post; and he is, therefore, we suppose, the Charles Montagu who is set down as one of the members for the city of Durham in James II.'s parliament which assembled 15th May, 1685. In the convention parliament he sat for Wakefield; he was returned for the same place to the next parliament, which met in March, 1690. It is stated to have been about the time of the Revolution that he married the Countess Dowager of Warton: she was Anne, widow of Robert, third Earl of Manchester, and daughter of Sir Christopher Yelverton, Bart.

According to Johnson, it was his intention when he formed the scheme for the new house of Commons, as he was disposed to be a liberal patron of arts and sciences, to reward the services of the poets by a premium of 1500l. in reward of their labors in the rebellion of the court of the Duke of Buckingham. He was, therefore, we suppose, the Charles Montagu who is set down as one of the members for the city of Durham in James II.'s parliament which assembled 15th May, 1685. establishment of a public library, out of which eventually came the Free Library Company.' (Burke, ii. 440.)

Having always kept up a connexion with the Hanoverian family, Lord Halifax was found, on the death of Queen Anne, to be one of the nineteen persons appointed by the new king to be offered to the electorate of Hanover till his majesty should come over. On the 14th of October, 1714, he was raised to the dignities of Earl of Halifax and Viscount Sunbury, and was restored at the same time to his former post of first lord of the Treasury, his office of auditor of the Exchequer being given to his nephew. But he died of an inflammation of the lungs on the 19th of May in the following year. He left no issue, so that his earldom and viscounty became extinct; but he was succeeded in his barony according to the limitation by his nephew George Montagu, who a few weeks after was made Earl of Halifax and Viscount Sunbury by a new creation. The son of the second Earl of Halifax died without issue in 1723, when all the honours became extinct.

Halifax was one of the most constant of the Whig party to whom we are indebted for the Revolution, the Hanoverian Succession, and the Union with Scotland. It is evident also, from the detail that has been given, that he was a person of great general ability. But he was much more a man of action than of any remarkable powers of thought; and what he wrote, whether in verse or prose, is of very little value. A list of his pieces is given by Walpole in his 'Royal and Noble Authors.' His character as a patron of literature has been delineated by Walpole with great accuracy and taste, and is the same as that of William III. 'Full-blow'd But, by Pope, in his 'Prologue to the Satires.'

HALL, REVEREND ROBERT, was born the 2nd of May, 1764, at Aynsham in Leicestershire, where his father, the same year, had been instituted as minister of the congregation of Particular Baptists. He had come from Northumber- land, where his forefathers belonged to the class of yeomen; and he is stated to have been a man, though not of much learning, of confident and active native powers of mind. He is the author of several short religious publications: one of which, entitled 'A Help to Zion's Travellers,' was several times printed.

The subject of this notice was the youngest of fourteen children. It is related that he was two years old before he learned to speak: but after this, the progress he made in all branches of his education was very rapid. Though the circumstance is absurd, it is an evidence of the impression he had made by his precocity—that when he was only twelve years old, a fellow-clergymen of his father's (Mr. Beeby Wallis, of Oakley, Northamptonshire), who was a literary man, had set him at eleven years and a half to learn Latin in the native village, a member of his father's congregation.

He lost his mother in 1776, and it appears to have been after her death that he was sent to be educated at a Baptist school in Northampton, kept by the Rev. Dr. John Ryland. Here he remained for a year and a half, after which he was placed, in October, 1778, at the Bristol Academy, with the view to his becoming a Baptist clergyman. It is the practice, it seems, for such students to commence their education before they have finished their education; and Hall was, as it is expressed, set apart as a preacher by his father's congregation in August, 1780. In the autumn of 1811 he was selected by the autho- rities of the Bristol Academy to be sent to King's College, Aberdeen, on which is called Dr. Ward's exhibition; and here he studied for the usual period of four winter sessions; preaching, in the meantime, in the intercessory services. It was at Aberdeen that Hall and the late Sir James Mackintosh, then also a student at King's College, became acquainted.

The treatment he met with in Aberdeen was such as to spring up between them led to an affectionate friendship, which lasted while they both lived.

Hall did not finally leave Aberdeen till May, 1785; but he had already, during the preceding summer, officiated as one of the regular pastors of the Baptist congregation at Broadmead, Bristol, in association with Dr. Caleb Evans; and in August of the same year, he was also appointed classical tutor in the Bristol Academy. His father died in 1791, and the same year a difference with Dr. Evans led to his removing from Bristol and accepting an invitation to become pastor of the Baptist congregation at Cambridge on the departure of the Rev. Robert Robinson to be successor to Dr. Priestley at Birmingham.

He had already acquired considerable celebrity as a preacher, but it was not till now that he appeared as an author; and the impulse that sent him to the press was rather the political than the religious. But Hall was succeeded in his barony according to the limitation by his nephew George Montagu, who a few weeks after was made Earl of Halifax and Viscount Sunbury by a new creation. The son of the second Earl of Halifax died without issue in 1723, when all the honours became extinct.

Halifax was one of the most constant of the Whig party to whom we are indebted for the Revolution, the Hanoverian Succession, and the Union with Scotland. His father died in 1791, and the same year a difference with Dr. Evans led to his removing from Bristol and accepting an invitation to become pastor of the Baptist congregation at Cambridge on the departure of the
of thought or even of knowledge; and are therefore nothing more than a record or memorial of what their author was.

Basil Hall, R.N., was born at Edinburgh in 1788. His father Sir James Hall, Bart., of Dunbar, was President of the Royal Society of Edinburgh. In 1788 he was the author of 'Essay on the Origin, Principles, and History of Gothic Architecture,' published in 1813, and a frequent contributor of scientific papers, chiefly on geological subjects. He was prominent in the scientific life of the day, and in 1817 he was married to Helen, a daughter of the fourth Earl of Douglah.

Basil Hall entered the Royal Navy in 1802; in 1808 received the command of a vessel of the same name of the St. Donat, and in 1817 he was made a post-captain. The opportunities which the naval profession afforded both for scientific pursuits and the study of men and manners in various parts of the world came in Captain Hall's case to lead him into scenes of more than usual interest; or perhaps it would be more correct to state that his eager and indefatigable pursuit of knowledge induced him to seek every means of extending the sphere of his observations. In 1815, when commanding a frigate on the East India station, he accompanied Sir Samuel Hood, the admiral, in a journey over the greater part of the island of Java. Soon after his return to England, he was appointed to the command of the Lyra, a small gun-brig, in which he accompanied the expedition which took Lord Amherst as ambassador to China. While the ambassador was pursuing his journey inland to Peking, Captain Hall in the Lyra visited the places of greatest interest in the adjacent seas, and on his return to England in 1817 he published 'A Voyage of Discovery to the Western Coast of Corea, and the Great Loo Choo Island in the Sprue Sea.' In 1819 he accompanied the expedition of the Great Eastern, which contains charts and various hydrographical and scientific notices. A second edition was published in 1820, in which the scientific details are omitted; and in 1827 the work appeared in a still more popular form as the first volume of 'Constable's Miscellany.'

In this edition there is an interesting account of Captain Hall's interview at St. Helena with the ex-Empress Napoleon. Josephine (Captain Hall's father) had been the emperor's fellow-student at Brienne, and was the first native of Great Britain whom the Empress recollected to have seen. Captain Hall was next employed on the South American station in command of the Conway. The period was one of great interest to the Spanish colonies of South America.

Halo is a circular band of faintly coloured light which is occasionally seen around the sun or moon by observers on the earth. It has been observed to the distance of 22 or 23 degrees, measured on a great circle passing through the luminaries. The colours of the solar halo are such as are observed in the rainbow, but they are less bright, and they do not always, in the halo, follow the same order as in the bow. Generally the red is nearest to the sun, the exterior of the band being a pale indigo or violet, and sometimes white; but occasionally the interior edge appears to be white, which is succeeded by yellow, and then by green, yellow, and a red pale. The lunar halo in general appears to be white, but it is at times tinted with pale green or red. Often observed on the moon, the halo is double, consisting of two rings, one being broader and lighter of the two. The distance of the inner from the outer band is about 6 degrees.

When a mist or thin cloud is between the sun or moon and a spectator, there is frequently observed an ill-defined circle of coloured light immediately surrounding the disk of the luminary: this is called a coronal, or sometimes a halo. A solar corona is observed, for instance, when the rays of the sun's surface are observed through a cloud of gas or smoke. The corona is a ring of light which is more or less bright and is usually white, but it may be yellow, orange, or red. The corona is usually observed in the form of a series of bright spots or points, called the corona rays, which extend in all directions from the sun. The corona is most easily seen when the sun is low in the sky, and is best observed through a telescope. The corona is usually observed in the form of a series of bright spots or points, called the corona rays, which extend in all directions from the sun. The corona is most easily seen when the sun is low in the sky, and is best observed through a telescope. The corona is usually observed in the form of a series of bright spots or points, called the corona rays, which extend in all directions from the sun. The corona is most easily seen when the sun is low in the sky, and is best observed through a telescope.
Englefield. The sun being about 14 degrees above the horizon, portions of two halos were seen, one at 24 degrees, and the other at 48 degrees from it; the interior portion was of a pale yellow, and a degree broad; and the other, which was about 14 degree broad, was tinted with prismatic colours, the red being nearest to the horizon. On the left and side of the interior ring, and in a line imagined to be parallel to the horizon,

was a faint parhelion; and vertically above the sun, in the same ring, was a very remarkable parhelion rather brighter than the true sun: it had a pearly appearance, was ill defined, and about 14 degrees in breadth. From the ring, a small tract of the sky: the parhelion with its curved prolongations is said to have had very much the appearance of a vast bird hovering over the sun.

The last figure is a representation of a great double halo which was observed by Captain Parry: in this, a horizontal circle of light, at the intersections of which with the interior halo were parhelia, passed through the true sun; and there were segments of circles both at the upper extremities of the two halos and at the lower extremities of the exterior one, the latter being incomplete. The altitude of the true sun was about 20 degrees; and the radii of the inner circles were, respectively, 224 degrees and 46 degrees. The lowest parhelion was very bright, but had no colours, while all the segments were strongly tinted with colour. Above the sun, at about 26 degrees from it, and between the two halos, was a small portion of a third halo, which appeared to be elliptical; and the space between the two segments was extremely brilliant, in consequence of strong refractions of the sun's rays through the first. The sun was far in the sea.

In the tropical regions coloured halos are frequent and brilliant; and, near the equator, Humboldt has observed small clouds surrounding the planet Venus.

The chain of phenomena which has been given of the halo by Mariotte and Dr. Young, is nearly as follows:—Between the spectator and the sun innumerable crystals of snow or ice, having the form of equilateral prisms, may exist in the air, in all possible positions: of these probably one half will be so situated as to be incapable of transmitting any refracted light to the eye, but vast numbers may have their transverse sections in planes nearly passing through the sun and spectator; and it is to follow (the position of the last-mentioned year Hevelius observed also a halo with two parhelia and a double corona about the body of the moon. Dr. Halley observed a halo with parhelia in 1703; and a very remarkable one was seen by Sir Henry Englefield at Richmond, in 1809 (Journal of the Royal Institution, vol. ii.).

Besides these, many such phenomena have been observed in Europe, in the United States, and in Canada; and Captain (Sir Edward) Parry observed and measured several during his voyages to the arctic regions.

The first of the subjoined figures is a representation of the phenomenon observed, as above mentioned, by Sir Henry
conspicuous mass: there is material for an excellent historical portrait gallery in the present scattered about in the thirty-one apartments which compose the gallery. In their present scattered condition, their pictorial value is the chief attraction of these portraits, and this, in most cases, is so slight that they arranged according to their ages and characters, they would obviously have a great historical interest for multitudes who would scarcely glance at them as mere paintings.

The old royal collection of Hampton Court was a comparatively small collection; but it contained a large proportion of interesting works, including many that were in the collections of Charles I. and James II., of which some still remain; but the greatest credit belongs to George IV., when that palace was repaired and enlarged by Sir Jeffrey Wyatville in 1828. The original collection of Charles I. consisted of 593 pictures, which were valued at 4674. 10s. by the appraisers of the Council of State previous to the sale of Charles's effects. Charles possessed altogether 1887 pictures and 399 pieces of sculpture, which were valued by the same party at 81,915. 12s. and 17,800. 10s. 6d. respectively. (A Catalogue and Description of the First Capital Collection of Pictures, &c., London, 1767.)

The following are the principal works of the present collection at Hampton Court:

1. The Guard Chamber, containing numbers 1 to 17 inclusive: Zuccheri's portrait of Queen Elizabeth's giant porter who was seven feet six inches high.

2. The King's first Presence Chamber. Queen Elizabeth's State Apartments, by Kneller, known as the Hampton Court Beauties; a wooden Equestrian portrait of William III., by Kneller; an excellent portrait of the first Marquis of Hamilton by Mytens; an extravagant allegorical satire which, though founded upon the story of Scolen (ANTIPHILUS, P. C. S.), is not painted from his description of the picture of Apelles of Ephesus; a portrait by Dobson, and one by Hollar; an Italian lawyer by Borelone, and a portrait by Titian, both good pictures; a well-painted picture of the painter De Bray and his family, by himself; and a copy of a Venus by Titian, in the Pitti Palace, attributed to Titian; and there are also several other portraits and hunting pieces which are attributed to great masters, particularly a Man showing a Trick, attributed to Da Vinci, which is evidently not by that master. 3. The second Presence Chamber, 62-106, contains an admirably painted picture described in the catalogue as 'The Sculptor Baccio Bandinelli, by Correggio;' but the head is not like the authentic portrait of Bandinelli, and the painting, though in the style of Correggio, is more probably a later imitation; a finely-painted head of Alessandro de' Medici, by Titian; a copy of a large picture at Windsor of Charles I. on horseback, by Vandyck; a copy of Sir J. Reynolds, by St. John Street; a portrait of a gentleman, by Vanderbeest; Christian IV., King of Denmark, by Vansomer; and Philip IV. and his queen, two portraits by Velasquez. 4. The Audience Chamber, 107-149, contains five Scripture subjects by Holbein, the head of a woman elevated in sentiment and beautiful in colour; Ignatius Loyola, by Titian, a very sinister-looking countenance; a portrait of the Queen of Bohemia, the daughter James I., by G. Houbraken; and several bad pictures attributed to great masters, especially a Venus and Cupid said to be copied by Rubens after Titian. 5. The King's Drawing-room, 150-175, contains the Carnaro Family, by Old Stone, after the original by Titian in Northumberland House by Joseph and Potiphar's wife, by Gentleschi; and the family of Pordenone, by himself, an extremely bad composition. 6. King William III.'s Bed-room, 175-206. In this room are the beauties of the court of Charles II., or the Windsor Beauties, painted chiefly by Lely: as pictures, they are dry, cold, monotonous and formal, and as portraits, so much alike that it is difficult to believe in a resemblance to the originals: the Duchess of Portsmouth, by Gasser, has a very different physiognomy from those by Lely, which are absolutely void of individuality; of Lely's the best in the room is the Princess Mary as Diana. 7. The King's Writing-Cabinet, contains a portrait of the queen of Charles I. 10. Her Majesty's Gallery, 272-448, contains many old portraits, some of which are among the historically most interesting and printed works in the collection. 8. The Museum, by Hollar and others, though all the pictures attributed to Holbein in this gallery are certainly not by that master: the best works of this room are the children of Henry VIII., by Mabus, painted in 1495: and the portraits of
Every facility is afforded for students desirous of copying in the gallery; but permission must first be procured from the Chief Commissioner of her Majesty's Woods and Forests, or of the Deputy Surveyor; for without permission no person is allowed to make even the slightest sketch in a picture-book, or in any way to make a record of what he has seen; an injurious and extremely absurd regulation; for if an artist should wish to sketch a Tudor ruff, or a Stewart tie, or any thing else of so much importance, he must first forward a petition to her Majesty's Chief Commissioner of Woods and Forests.

Hampton Court is a very favourable resort in the summer; there have frequently been as many as 5000 visitors in a single day, as may be seen from the fact that 50,000 peacocks are bred there. There are catalogues also in Mrs. Jameson's 'Hand-book to the Public Galleries of Art in and about London'; and in 'The Enquiries of London,' by John Fisher Murray.

HANDWRITING, PROOF OF. [Evidence, P. C.]

HABEDELL, [Campanula, P. C. S.]

HARLOW, GEORGE HENRY, was born in London in 1787. He was the only son of his parents; his father, who was a merchant, died while he was an infant, and he was brought up by his mother, who watched with interest and anxiety the early development of her son's talent for drawing. He had little education. He was a fine artist at about seven years old; and when about sixteen he was placed with a Flemish landscape painter of the name of De Cort, whom he left for the late Mr. Drummond, A.R.A., the portrait-painter; and he was afterwards with the late Mr. Robert Smirke, R.A., of the church at Latymer, in Greek Street, with the privilege of copying pictures there, from nine until four o'clock, but with an especial proviso that he should receive 'no instruction of any kind.' Harlow had the privilege of setting up his easel whenever he pleased, except the expiration however of a year and a half, the master and pupil quarrelled. Lawrence used to employ Harlow to dead-colour, and Harlow had so far a share in painting a much admired daguerreotype of the author, which, as the Angerstein's, had the impropriety to claim as his own. This came of course to the ears of Lawrence, who, in consequence said to his pupil, 'As the animal you claim is among the best, and as this is the beginning of the matter, I will give you further instruction from me. You must leave my house immediately.' Harlow has the credit of having reversed Lawrence's resentment by painting a caricature of his style, upon a sign-board at Epsom, in one corner of which he wrote, 'T. L., Greek Street, Solo.'

Harlow, however, had little need of any man's assistance or instruction; he possessed a fine feeling for colour, a tolerably correct eye for form, and great facility of execution, especially in portraiture in small, whether in pencil, crayons, or oil-colours; and he was the rival of Lawrence at the age of twenty-two. He never studied at the Royal Academy; he never exhibited a picture there, as he had no money to pay the necessary subscriptions. He was a pupil of Mr. West, and to a certain extent of Sir Joshua Reynolds, whose father he did not know, Fussell's biographer; it is a work of the highest merit in every respect. The portraits of Northcote and Nollekens are also among his best works.

Having already obtained a considerable reputation and some means, Harlow set out, in June, 1818, upon a visit to Rome, where he attracted great notice and excited some wonderment by completing an effective copy of the Transfiguration, by Raphael, in a single month. His Diary—'I then leave the world can show nothing nobler of the kind than the stories of Abraham and Tobit.' They were estimated in the parliamentary inventory at 800l. ; but they were reserved by Cruikshank, who bought them, while he is told in ten other apartments, eight of which are in the hall, and two in the public dining-room (14), where there is also a tapestry of Tobit, with the angels, taking leave of his father Tobit, and his wife Anna, on his journey for the Levant. In the large apartment next to the hall, called the Waiting-drawing-room, are some much older tapestries, in a barbarous style of composition; their subjects are allegorical, but the colours are so faded that their value is uncertain. Above the draperies are scenes from some of the frescoes painted by Cignani: they are the cartoons of some frescoes painted by him in the ducal palace at Parma.
HAMPDEN, a genus of fossil Crustaceae (Trilobites), from the Devonian strata.

HARRIS, M., EARL OF, P.C. S. ("Travels in North America," vol. ii. p. 136.) Harrison of Chester, although he was not a native of that city, for he was born at Wakefield in Yorkshire, in 1744. While yet little more than a mere lad, he was sent to Italy, then considered almost the only efficient school for architectural study; and during his stay at Rome, where he remained for several years, he made designs for improving and embellishing the Piazza del Popolo, which obtained for him both a gold and silver medal from Pope Benedict XIII, and he was also complimented by being elected a member of the Academy of St. Luke. On his return, one of his first works was a bridge of five arches over the Lune, at Lancaster, at which place he was subsequently employed upon various alterations and improvements in the castle. At Chester, he erected the gaol, and the county courts, which last was considered at the time a very fine and correct specimen of the Grecian Doric style, and the portico erected over the entrance to the building. In that year he commenced the columnation, for though only hexastyle, it has twelve columns, there being a second row of six columns behind those in front. He also erected several works at both Liverpool and Manchester; in the former place the Exchange, and in the tower of St. Nicholas' church; in the latter, the Exchange buildings (since greatly enlarged and altered), the theatre (burnt down in 1843, and now succeeded by the new structure by Messrs. Irwin and Chester, opened September 29, 1845), and the library and reading-room called the portico. The Hill column at Shrewsbury, the triumphal arch at Holyhead, and the jubilee tower erected on Moel Famau in commemoration of the fiftieth year of the reign of George III. are all by Harrison. He also built for the Earl of Elgin his new mansion of Broome Hall, in Scotland, in the Grecian Doric style, which seems to have been equally the favourite one of his noble employer and himself. Cumberland in his "Observer" has complimented Harrison in very high terms for the pure classicality of his taste.

Harrison died at Chester, March 29, 1829. HARRISON, WILLIAM HENRY, late President of the United States, was born in Virginia, 9th February, 1773. His father was Benjamin Harrison, who was a member of the first Virginia House of Delegates. Phillip Melancton was one of those who signed the Declaration of Independence, and was afterwards governor of Virginia, his native state. He died in 1791. William Henry was educated at Hampden Sydney College, where in 1794 he became a member of the class of 1794; but soon after the death of his father he joined a force which was raised to defend the Ohio territory against the Indians; and the next six years of his life were spent in military service. In 1798 he entered West Point Military Academy. He was an officer of artillery; he was soon after raised to the rank of lieutenant, and in that capacity he was present and distinguished himself at what is called the battle of the Miami, in which a signal victory was obtained over the Indians. After this he was placed in command of Fort Washington, one of the most important defences of the western frontier. In 1797, this war having been brought to an end, he resigned his commission, and in 1798 was appointed secretary and ex officio lieutenant-governor of the north-western territory, then comprehending the whole country to the north-west of the river Ohio. In 1799, when the north-western territory was admitted to what is called the second grade of territorial governments, entitling it to a legislative body composed of representatives chosen by the people, he was elected a member of the territorial congress. In 1801, when Indiana was erected into a territorial government, Harrison was appointed governor, and this situation he appears to have held till the erection of Indiana into a state in 1816. He greatly distinguished himself both in the war with the Indians and the war with the British, in 1812, and in the English conquest of Canada in 1812 and 1813. In both these wars he held the rank of a general. In 1816 he was returned to the House of Representatives as one of the members for Ohio. In 1828 he was a member of the United States Senate, and all these military and civil services General Harrison had acquired great popularity; and in 1840 he was elected president; but he died, at the official residence in Washington, on the 4th of April, 1841, being the first president who had not been a public servant and an able man; but he did not belong to the same class of minds with his predecessors Washington, Adams, Jefferson, and Madison. In his Essay on the Aborigines of the Ohio valley, which was published in the "Transactions of the Literary and Philosophical Society of Ohio," vol. i. 1829, he has made some interesting remarks on ancient Indian mounds and on the original state of the forests of America. (See Lyell's "Rift of the Earth," vol. i. p. 43.)

HARTSHORN, SPIRIT OF. [AMMORIA, P. C. S.]

HARTSOCKER, NICOLAS, a Dutch natural philosopher, was born at Grono in 1664; his father, who was a minister of the Reformed religion, intender that he should enter the church as a profession; but a taste for the sciences, which the youth early evinced, prevented this intention from being carried into effect.

From the money which was allowed him by his father, young Hartsoeker saved enough to pay the fees of a teacher of mathematics; and he passed the greater part of each night in studying the subjects connected with the instruction which he received by day.

An accidental circumstance is said to have directed his attention to the construction of optical instruments: having presented a flower to a friend, it happened that she examined it, and was surprised to observe that the extremity, when milled, assumed a spherical form; and he immediately conceived the idea of using such spheres for the formation of a glass eye. It is said, on account, which he published in 1678, of the instruments thus formed, he asserts that he discovered the animals which exist in animal fluids [Levensschop, P. C.]; and, with the like instruments, Letort is said to have, first, perceived the red globules in blood.

In 1674 Hartsoeker was sent to pursue his theological studies at Leyden; and, in that city, he became known to Huyghens, who encouraged him in the prosecution of his microscopical observations: the two philosophers subsequently went together to Paris, where Hartsoeker was introduced to Cassini, who recommended him to exercise his ingenuity in the formation of object-glasses for telescopes; and it appears that, after several fruitless essays, he succeeded in obtaining some which were superior to that which had been before executed. These were of about 600 feet focal length; and in order that they might have truly spherical forms, he first, by means of sand, made a very shallow excavation in a plate of glass; then giving, by the like means, a slight convexity to one side of the plate of which the intended object-glass was to be formed, he ground the convexity of the other, and, by friction, brought the contiguous surfaces of both plates to equal and consequently spherical figures. In 1694 he published his "Essai de Dioptriques; ou, Traité des lentilles..." (Paris, 4to.) in which he attempted to give a general theory of the laws of nature respecting the hardness, elasticity, transparency, &c. of bodies. These subjects were, afterwards, explained in detail in his "Principes de Physic," which he published in 1696.

The work was criticised by a writer in the 'Journal des Savans,' in the same year; and Hartsoeker seems to have revenged himself by making a violent attack on the "Mémoires de l'Académie des Sciences." The attack, however, remained unnoticed. It appears to have been the character of Hartsoeker to seek occasions of entering into discussions with his friends; and if he, at length, lost the good opinion of the patient Leuwenhock by urging captious objections to the results of some of his experiments.

Having become embarrased in his circumstances, Hartsoeker was obliged, in 1696, to quit Paris: he retired to Rotterdam, where he published the work above mentioned; and he afterwards removed to Amsterdam. At this time he was introduced to the Czar Peter, then travelling inognit, and he was appointed to give the emperor lessons in natural philosophy. His conversation was so agreeable to the Czar that the latter invited him to Russia. Hartsoeker however declined leaving Amsterdam, and the magistrates of the city built for him an observatory in the basement of the English Consulate. The Elector Palatine having repeatedly offered Hartsoeker the place of professor of mathematics and philosophy at Düsseldorf, he at length accepted it; and, in the year 1704, he went to reside in that town. During the years 1714 and 1715, he made several journeys to different parts of Germany in
HAU

HEA

order to visit the learned men of the country; and at Han-ower he was presented to the elector by the celebrated Leib-ningen. On his return from Duke's Court he caused three burn- lises similar to those of Tachinhauen to be executed. On the death of the Elector Palatine, Hartsocker, declining the solicitation of the Landgrave of Hesse-Cassel that he would resioved to Ulm, where he died in 1725. He had been a admitted a foreign associate of the Académie des Sciences of Paris in 1699; and he was also a member of the Academy of Berlin.

The Abbé Hautefeuille, such is his designation, devoted himself to the study of subjects connected with physical sci- ence, and to the construction or improvement of instruments; but he is distinguished chiefly by the claims which he ad- vanced in the honour of restoring the balance for watches. This contrivance consisted of a straight spring of steel which he applied so that it served to regulate the movements. About the same time Huygens invented, for the like purpose, a form of pendulum of a different kind: it happened however that Hautefeuille had communicated his invention to the Académie des Sciences of Paris in the preceding year; therefore when Huygens applied to the French Government to be allowed the exclusive privilege of using it, he was opposed by Hautefeuille, and he subse- quently withdrew his application. It is remarkable that Dr. Hooke had, about the year 1658, invented a balance-spring for watches, but he spent several years in improving his escapement, and his watches were not made public till about the same year that the inventions of Hautefeuille and Huygens were in use in Paris.

In 1735 Hartsocker published a work entitled 'Recueil de plusieurs Travaux de Physique, ou l'on fait principalement voir l'Exactitude du Système de Newton.' He also caused a letter to be printed in the 'Journal des Savans,' containing some absurd remarks on the hypothesis of the English philosopher. He treated Leibnitz no better, attacking with great violence his system of philosophy, and of a general kind. He would never admit the advantages of the 'Intuitionnal Calculus,' and persisted in considering it as an unintelligible jargon by the aid of which certain learned men sought to in- crease the simplicity of the sciences. He despised the moderns; as a superficial and an arrogant man; but his violence is sup- posed to be less owing to envy than to a morbid taste for disputation.

HARTZ. [GERMANY. P. C., p. 186.]

HASSELOQUISTIA, a genus of plants named by Linnaeus in honor of Fred. Haselequist, M.D., his pupil, who trav- eled in the Holy Land. It belongs to the natural order Umbelliferae, and to the tribe Tordyliaceae. The species closely resembles those of Tordylium, and are regarded by some botani- stis as monstrous forms of this genus.

HAUGHTON, WILLIAM, a dramatic writer, was prob- ably somewhat the junior of Shakspere. In Hemans's Diary, under the date of November, 1867, he is called 'Young Haughton;' and his name occurs frequently in that curious record, till the end of the year 1860, but not later. In March, 1869, Hemans lent him ten shillings to pay a debt, for which he then lay in the Clink prison; and constant ad- vances of small sums, in earnest of the prices of dramas which he was writing for the old manage, show him to have been as poor or improvident as most of his fellow-playwrights. He wrote several plays unamused; in others his coadjutors were Chettle, Day, and still more frequently Dekker, with whom he was in the habit of having strong and particular quarrels. In 1600 there was licensed a tragedy of his, not preserved, called 'Ferrex and Forrex;' and Mr. Collier has conjectured that Haughton's 'Devil and His Dam,' described as in 'Two Parts,' was not, as some suppose, an alternate title of 'Grim, the Collier of Croydon.' The same critic is more confident in believing that 'The Spanish Moor's Tragedy,' for which, in February, 1600, Hemans wrote to Dekker, Haughton, and Day a payment of three pounds to account, was the wild tragedy called 'Lust's Dominion,' which was printed for the first time in 1657, and has been inserted (without reason) in the recent edition of Marlowe's works. But the only extant plays in which Haughton is certainly concerned are two. 1. He was sole author of the lively comedy called 'Englishmen for Money; or, a Woman will have her Will,' which (under the latter title) appears in Hemans's 'Diary' of 1600. It was printed in 1616, 1618, and 1631, and has been reprinted in a small collection called 'The Old English Drama,' 1880, 4 vols. 12mo. 2. Dekker, Haughton, and Chettle were jointly the authors of 'The Playhouse' at Stationers' Hall in March, 1600, printed in 1605, and reprinted from a very rare copy by the Shakespeare Society in 1841.

HAUTERVILLE, JEAN-Louis, a bottle mechanic, was born at Orleans, September 20, 1647. His father, who was a baker, being accustomed to supply with bread the master of the house at which the duchess of Bouillon then resided, pre- vailed upon the master to allow the youth to the notice of that lady. The duchess having considered him with that favor, an interview took place, when the lady was so well satisfied with

the young man that she engaged to pay the expense of his education; and, on his entering into the ecclesiastical state, she retained him as her chaplain. He never after quitted his benefactress, who conferred upon him several benefices, and at her death she bequeathed to him a pension.

The Abbé Hautefeuille, such as his designation, devoted himself to the study of subjects connected with physical sci- ence, and to the construction or improvement of instruments; but he is distinguished chiefly by the claims which he ad- vanced in the honor of restoring the balance for watches. This contrivance consisted of a straight spring of steel which he applied so that it served to regulate the movements. About the same time Huygens invented, for the like purpose, a form of pendulum of a different kind: it happened however that Hautefeuille had communicated his invention to the Académie des Sciences of Paris in the preceding year; therefore when Huygens applied to the French Government to be allowed the exclusive privilege of using it, he was opposed by Hautefeuille, and he subse- quently withdrew his application. It is remarkable that Dr. Hooke had, about the year 1658, invented a balance-spring for watches, but he spent several years in improving his escapement, and his watches were not made public till about the same year that the inventions of Hautefeuille and Huygens were in use in Paris.

The other attempts to improve the projects of Hautefeuille are numerous, but few of them appear to have been brought to perfection. He published in 1692, at Paris, a work enti- tled 'Recueil des Ouvrages de M. de Hautefeuille,' which contains an account of his improvement of the clock; an account of pendulums in which the weight was to be raised by the action of the atmosphere; a method of raising water by means of fired gun-powder; and an account of some improvements in telescopes in which the field of view was to be increased by means of a concave mirror; also some observations on machines for raising water; a de- scription of a pump which was to act without friction; and an account of a contrivance for mounting telescopes of great length.

Hautefeuille published a method of finding the declination of a magnetic needle (1685); an account of a magnetic balance (1702); with accounts of a micrometrical microscope, and of an instrument for observing the altitudes of celestial bodies. He also published, in 1719, a work entitled ' Nouveau Système du Flux et Reflux de la Mer,' in which the phenomena of the tides are made to depend upon a particular motion which he ascribes to the earth; but the best of his works is his 'Dis- certation sur la Cauce de l'Echo,' which had been read before the Academy of Bordeaux in 1718, and was published in that city in 1741.

Hautefeuille appears to have been in haste to publish his ideas as soon as they arose in his mind, without waiting to see their final perfection. His papers, however, are of his projects are rude conceptions which have not led to any object of practical utility. The opinion entertained of him by his countrymen is manifest from the fact that he was never admitted to the rank of the Sciences though he ardently desired that honour. He died October 18, 1754, being then seventy-seven years of age.

( Biographie Universelle.)

HAWKER. [PEDER, P. C.]

HAYMAN, FRANCIS, R. A., the best historical painter in England before the arrival of Cipriani, was born at Exeter about the commencement of the eighteenth century. He was the scholar of Robert Brown, and was in early life much employed by Fleetwood, the proprietor of Drury Lane old theatre, and by Titers, the proprietor of Vauxhall. He also made many designs for booksellers, the best of which are the illustrations to Sir Thomas Hales's Sciences though he ardently desired that honour. He died in 1776. (Edwards, Anecdotes of Painters, &c.; Somerset House, 1843.)

HEADBROUGH. [CONSTABLE, P. C.]

HEALTH, PUBLIC. [Public Health, P. C. S.]

HEARSAV. [Evidence, P. C. S.]

HEAT. [ABSTRACTION AND ABSORPTION OF HEAT, P. C. S.; Conditions of Heat, P. C. S.]

HEAT, ANIMAL. The conversion of the food of man and the higher animals into nutriment for the body is attended with changes which produce an evolution of heat, at which concludes an animal at a point above or below, according to circumstances, the temperature of the
medium in which it exists. The degree of heat possessed by animals not gifted with the power of locomotion is very small above that of surrounding media, and in this respect resembles the heat given off by plants. [TEMPERATURE OF PLANTS, P. C.] In proportion as animals possess the power of locomotion they evolve heat from their bodies. This arises from the fact that the more the organism is most exercised there is greatest demand made upon the nutritive processes going on in the system. We should therefore expect to find that the quantity of heat developed in the irrational animals was less than that in the vertebrate class. Infusoria are for a time capable of resisting cold; for when the water in which they are contained is frozen, the animalcules are covered to live in a little encased space where the color of its body prevents freezing. John Hunter found that various forms of Amoebula, as leeches and worms, and several of the Mollusces, exhibited temperatures higher than the surrounding media. As might have been anticipated from their activity, the insects of all the invertebrate animals exhibit the highest temperature. They have been lately the subject of experiment by Mr. Newport. He found that they possessed a temperature above that of the medium in which they lived, varying from 20° to 90°.

With respect to the temperature of the different tribes, Mr. Newport observes, 'Our previous observations lead us to anticipate the fact, that the volant insects, in their perfect state, have the highest temperature, while, on pursuing the inquiry, it is found that those species which have the lowest temperature are located on the earth. Among the volant insects, those belonging to Diptera and Hymenoptera are those which maintain the highest temperature which pass nearly the whole of their active condition on the wing in the open atmosphere, either basking in the face of day despoiling the blossoms of their honied treasures, or fitting wanly from flower to flower, and breathing the largest amount of atmospheric influence. Of these the hive-bee, with its long train of near and distant affinities, and the elegant and sportive butterflies, have the highest temperatures. Next to these are probably those insects that encompass the horns and waists, and others of the same order; and, lastly, a tribe of insects which have always attracted attention, and in general are located on the ground, but sometimes enjoy the volant condition—the ants, the temperature of whose dwelling has been found to be considerably above that of the atmosphere. Next below the diurnal insects are the crepuscular, the highest of which are the spiders and moths; and almost equal with them are the Melonothon. In insects which live in societies the temperature is still greater. Mr. Newport found that a bee's nest in a chalk bank had a temperature 14° to 16° above that of the atmosphere, and 17° to 19° above that of the bank.

Amongst the vertebrate animals, fishes and reptiles have the lowest temperature. Dr. Davy, John Hunter, and others have given the summation temperature of from 7° to 7° above the surrounding medium.

In man the temperature of the accessible parts of the body, as the mouth, axilla, &c., is usually between 97° and 98°. The temperature of the blood is found to have the following range, varying from 100° to 101°75°; in disease it rises to 106° or 10°. In healthy persons the temperature is said to attain its maximum during the day, and to fall from 1° to 2° during sleep. Dr. Davy has also found that the temperature of the interior of the body is 2° to 3° higher in tropical than in temperate climates. Most of the Mammalia have a higher temperature than man, and birds develop a greater quantity of heat than any other class of animals. This arises from the nutritional changes going on in the bird in order to support the enormous muscular power which it is compelled to exert during flight. The following is a table of temperatures, as given by Rapin and Pedemans, for several birds and Mammalia:

There is now no question that the cause of animal heat is the chemical changes which are going on in the nutrient fluid of the body. During the act of respiration a large quantity of oxygen gas is taken into the lungs, which is absorbed by the blood. In this fluid it meets the various compounds of carbon which have been taken in with the food; and the consequence is a union of the oxygen with the carbon, and the formation of carbonic acid gas, which is given out when the blood again reaches the lungs during respiration. When carbon and oxygen unite out of the body, heat is the result, and the same thing occurs when they unite in the body; and it is through the medium of this change that the bodies of animals are raised to a given temperature by the circulation of the blood through the system. It has been calculated that there is more oxygen absorbed than is given off, and the excess is carried out of the system in the form of carbonic acid. It is probable that this enters into combination with hydrogen and compounds of hydrogen, nitrogen, and carbon, and thus contributes to the raising of the animal heat.

This theory of animal heat explains many well-known phenomena; for instance, the slight independent warmth of the foetus, and of those young animals which are born in an imperfectly developed condition. The low temperature of persons with scorbutic constitution, where the blood is slowly and imperfectly oxygenated, and the cold experienced by aged and debilitated persons in whom a small quantity of blood circulates slowly; as also the increased temperature observed in persons labouring under attacks of inflammatory disease where the blood circulates rapidly, are also confirmatory facts. The phenomena also exhibited by the hybernation of animals are explained by this theory. During the period of hybernation, when the blood is circulating only slowly and respiration is almost suspended, and the oxygenation of the blood is feebly performed, the temperature of the animal is low. The observations of Pallus and others show that hybernation is prevented by a temperature of from 50° to 60°, whilst it is induced in those animals which exhibit it even in summer by the application of artificial cold.

The production of heat is also the cause of the mass of the globules of the blood and the rapidity with which they circulate. When there are few blood-globules the necessity for the absorption of oxygen is diminished in the same ratio, and the circulation becomes slower, and the contrariety is that there is heat less developed. On the other hand, blood containing an excess of globules, but which is circulated less slowly, develops less heat than blood which contains a smaller proportion of globules but which is more rapidly circulated; for more oxygen may be consumed in the latter than in the former case.

The metamorphosis of the blood and the general changes of matter lead to still another source of heat. It has been shown by Pouillet that all solid bodies, organic and inorganic, undergo an elevation of temperature when moistened with different fluids. In organic substances it may amount to from 18°. Since the action of heat is always effected through humid membranes, this source of heat must be regarded as of great importance, even if it be not actually identical with the catalytic metamorphosis of the cells themselves. (Simon.)

(Carpenter, General and Comparative Physiology; Simon, Medical Chemistry, by Day.)

HEBER, REGINALD. Second Bishop of Cutchwa, was born April 31, at Malpass, Cheshire, of which place his father was for many years co-rector. The family was of considerable antiquity in the county of York, and on the death of an elder brother without issue, the father of Reginald Heber succeeded him as lord of the manors of Marton, Yorkshire, and parson of the rectories there; and estates at Hodnet, Shropshire, which had come into the
possession of the family by intermarriage. By his first marriage, with Mary, co-heiress of the Rev. Martin Baylce, rector of Wretham, Suffolk, he had one child, Richard, who for some time was representative in Parliament of the University of Oxford, and is known as the author of a collection of Poems. On the second marriage, with Mary, daughter of Cuthbert Allanson, D.D., he had three children—Reginald, the subject of the present notice, Thomas, Cuthbert, and Edwin.

At a very early period of his childhood, Reginald Heber was remarkable for his piety and for his eager thirst for knowledge. An excellent memory enabled him to recollect the contents of a book he had read within a year of its publication. He gave early indications of his poetical talents, and at seven years old he had translated Phaedra into English verse. At eight he was sent to the grammar-school of Haverford under Dr. Kent, and in his thirteenth year he was placed in the school of a clergyman near London. He remained there about three years, and in November, 1800, was entered at Brasenose College, Oxford. In his first year at the University he gained the prize for Latin verse, the subject of his poem being on the commencement of the new century. In the spring of 1803 he wrote his prize poem, 'Palestine,' which has obtained a permanent place in English literature. His career at Oxford was a regular one, and he stood at the head of his class in all the branches of his studies. The modesty of his manners, his gentleness of disposition, and the charm of his conversation, his society was courted by persons of all ages. In his studies he evinced no taste for the exact sciences; all his mental powers were concentrated on literature. About the middle of 1805, in company with his friend Mr. John Thornton, son of the member for Surrey, he set out on a continental tour. They proceeded through Rottemberg, Hamburg, Amsterdam, and Prussia, and returned to England in October, 1806. In 1807, before he had obtained his degree of M.A., he took orders, and was instituted by his brother Richard to the family living at Houghton. In the same year he was called to the bar, and in '18 he commenced practice. He himself describes his situation in his 'Letter to a Friend,' written in '1808. 'Never however were the duties of a parochial clergyman discharged with more exemplary zeal and benevolence; and Heber's conduct in his parish has often been pointed at as displaying in the greatest perfection all the best characteristics of a Church of England priest. In April, 1809, he married Amelia, youngest daughter of Dr. Shipley, Dean of St. Asaph. While discharging the duties of his parish with so much cheerfulness he was ardently attached to the pursuits of literature. He was a frequent contributor to the 'Quarterly Review' from its commencement. In 1812 he commenced the preparation of the 'General History of the Bible.' In 1815 he published with much delight, but other duties compelled him to suspend this work, and no part of it was ever published. In the same year a small volume of 'Poems and Translations for Weekly Church Service' was published. 'Hyms,' with a view of improving the psalmody and devotional poetry used in churches, was also a favourite recreation. He was an elegant versifier, and continued to indulge his poetical talents even while engaged in visiting his diocese in India. He had a great distaste for controversial theology, and only once was engaged in a discussion of this kind, in reply to what he conceived were the unwarrantable imputations of a writer in the 'British Critic.' His life was diversified by an occasional visit to his friends in other parts of England, or to his father-in-law in Wales, and by correspondence with a few friends whose views were those of the High Church party and Tory party, but devoid of all bitterness. He was well content with things as they were, and apparently had no perception of those abuses which have been swept away within the last thirty years. In 1815 he received a call to be lecturer, and the subject he selected was 'The Personality and Office of the Christian Comforter.' In 1817, Dr. Lummore, the Bishop of St. Asaph, appointed Heber to a stall in that cathedral, at the stipend of a curacy in his diocese. In 1819 he edited the works of Bishop Jeremy Taylor. His other works consist of 'Parish Sermons' published at Hodnet; and Sermons preached in India. In 1829, he succeeded to the living of Llangollen, for which he had formerly been an unsuccessful candidate. On the 2nd of December, in the same year, his friend and connection, the Right Honourable Charles W. Williams Wynn, who was at the time President of the Board of Control, consulted him confidentially respecting the appointment to the vacant see of Calcutta, but did not offer him the appointment. There was every probability in fact that in the course of a few years Heber would have occupied that position, and the correspondence with the Bishop of London was not revealed to him. By an accident in India much trouble and anxiety were occasioned to his wife and child, but immediately after the second refusal he wrote (12th Jan. 1833) stating his willingness to go to India. He congratulated himself upon the fact that no work was now more congenial to him, and that prospect of usefulness in so grand a field as India overborne all pecuniary considerations, and they had no influence in determining his conduct when the proposition of going to that country was first made to him. Besides, he had often expressed his liking for such a sphere of action, and he had 'a lurking fondness for all which belongs to India or Asia.' On the 22nd of April he saw Hodnet for the last time, and after having been consecrated, he embarked for his diocese, June 16th, 1833. The Diocese of Calcutta extended at this time over the whole of India, and embraced Ceylon, the Mauritius, and Australasia. In India the field of the bishop's labours was three times greater, and the number of chaplains who constituted his staff in Bengal was fixed at twenty-eight, but this number was never completed, and of the number who were appointed several were on furlough. The Bishop of Calcutta had not the power on his own act to his own responsibility, and to write almost every official document with his own hand. On the 15th of June, 1824, Bishop Heber began the visitation of his vast diocese. He visited the United Provinces, the principal towns of Hindustan, and the ports of Bengal and north of Bombay, and after an absence from Calcutta of about eleven months, during which he had seldom slept out of his cabin or tent, he arrived at Bombay. The Journal which Bishop Heber kept during this visitation has been published in three octavo volumes, shows the extent of his observations on general subjects and the graphic power which he possessed of describing the novel scenes in which he was placed. From April to August he remained at Bombay to investigate and superintend the interests of the western portion of his diocese. On the 15th of August he sailed for Ceylon, and after remaining there some time he proceeded to Calcutta, which he reached on the 21st of October. If it had been possible to have educated his children in India, he was now prepared, he states, to end his days amongst the objects of his solicitude. In February, 1826, he left Calcutta for Madras to visit the southern provinces. On the 1st of April he arrived at Trichinopoly, and on the 5th, after investigating the state of the mission and confirming fifteen natives, on whom he bestowed the episcopal blessing, he returned to Calcutta. In the month of August, in which he was found dead about half an hour after dinner. Within less than three weeks he would have completed his forty-third year. The handsome, modest, and simple manner of his life, combined with his talents and attainments, had inspired veneration and respect not only amongst the Europeans but the native population of India. It was said by those who were capable of judging that few persons, civil or military, had undergone such much labour, traversed as much country, seen and regulated so much in so short a time. On the announcement of his death the most eminent men at each of the three Presidencies and in Ceylon united in showing their regret at the loss which they had sustained. At Calcutta it was agreed to erect in the cathedral a monument to his memory, which was carried out by Chantry. A monument, also by Chantry, was erected in St. George's Church, Madras, in testimony of the public regret. At Bombay it was resolved to establish, in Bishop's College, a memorial chair to the title of 'Bishop Heber's Bombay Scholarship.' Mural tablets were erected in the churches of Trichinopoly and at Colombo in Ceylon. His friends in England placed a monument in St. Paul's Cathedral, London. The Dean of the Dean of the Church of England, on the 19th of December, 1829, erected a magnificent monument to his memory, the inscription on which was written by Southey. (Life of Reginald Heber, by his Widow, 2 vols. 4to., London, 1830. This work contains Selections from his Correspondence and Speeches, and a Sketch of his Life by Walter Scott. Journal of his Tour in Russia, etc., and a History of the Cossacks. Last Days of Bishop Heber, by the Archbishop of Madras.)
HECTOR ('Hetor'), the greatest of the Trojan heroes who figure in our accounts of the Trojan war. He was the son of Priam and Hebe, and married to Andromache. The poet Homer hailed him as a "greater than the gods" and as a "single warrior whom Achilles himself dreaded to approach, but as a hero ennobled by all the more tender and humane virtues, so that it almost seems as if the poet had developed his character more with a view to more exalted deeds than those of the Achaians, exceeding Achilleus. Hector is the favourite of his parents, and himself a happy husband and father. The reader need only be reminded of the beautiful passages in the 'Iliad' (vi. 369 f.), where Hector, before going to battle, takes leave of his wife and child, and where (xii. 271), amid the lamentations of his parents, he prepares himself for the contest with Achilles. Wherever the battle is fiercest, Hector is foremost, and his ally, Daunus, the son of Ares (Mars) and Apollo, he fights most courageously against the bravest of the Greeks, as Ajax, Nestor, Diomedes, and Teucer. He was foremost among those who stormed the Greek camp, and advanced as far as the walls that were about the city, and when the Trojans came forward and drove the Trojans back to their city, but was slain by Hector. This calamity roused Achilles from his inactivity, and he, determined to avenge the death of his friend, sought Hector, who, though implored by his parents to save himself, resolved to engage with his enemy. Achilles thrice chased him round the walls of Troy, and finally pierced him with his great chariot of fire, as a token of his ability to do a deed of value; and Hector, after being shot, was dragged by the chariot and dragged to the camp of the Greeks; at the funeral solemnities of Patroclus, it was dragged thrice around his tomb, and then thrown away to be devoured by the dogs; but it was preserved, as it is said, when the Scyths appeared as a suppliant before him and begged for it. The remains of Hector were buried at Troy, where funeral sacrifices were offered to Hector as a hero; at a later time, however, his remains are said to have been conveyed to Thessalian, in pursuance of an oracle. (Pausanias, iii. 19. 9; ix. 18. 4.)

HEDJAZ. [Arabia, P. C. and P. C. S.]

HE'DYSARUM (from ἕδυσσαι, the Greek name of the Corydalis salviifolia) is a species of characters of the genus Nardostachys, in the order Leguminosae. It has 5-6 calyx, with the segments subulate and nearly equal; the corolla with a large vexillum, and obovate tegumen; keel much longer than the wing; the stamens diadelphous; the legumes of numerous flat oblong or lenticular 1-seeded joints, which are connected together in the middle, and therefore the fruits are convoluted in both sides. The species are herbaceous or sub-shrubby, with unguiculate pinnate leaflets, axillary, with simple peduncles, and bearing racemose spikes of large purple, white, or cream-coloured flowers. The old genus Hedyasarum has been subdivided into many smaller genera. The Saintfins [Saintfin, P. C. C.], H. oenophyllos of older writers, now forms the genus Oenothera, which differs from Hedyasarum in the legumes consisting of many joints, not of one joint, as in the last. (1.)

H. coronarium. French honey-suckle, has diffuse stems, the leaves with 3-5 pairs of elliptic or roundish leaflets, which are pubescent beneath and on the margins; the spikes or racemes are compact, of a very long duration, and twice the length of the calyx; the legumes glabrous, with 25 orbicular prickly joints. It is native of Spain and Italy. It has deep red or white flowers. In Calabria this plant grows wild in great abundant masses and horses and muleteers feed with it. It grows well in our gardens, but probably would not make a good field crop.

H. fruticosum has an erect shrubby stem, the leaves with 5-7 pairs of alternate elliptic obtuse leaflets, which are clothed with pubescence on both surfaces; the flowers few, disposed in spikes; the wings hardly longer than the calyx; the vexillum the length of the keel; the joints of the legume wrinkled; the nerves slightly echinate. It is a native of Siberia in sandy places. It has a pale purple flower, and a very handsome plant. Horses eat it with avidity, and it may be made useful in fixing sand, in which it grows readily. It has a himant stem. The leaflets oblong, clothed on both surfaces with cancellous pistil; the stipules sheathing; the joints of the legume transversely wrinkled and echinate. In late summer, it grows abundantly about the Saskatchewan, on the Eagle and Red deer hills. The flowers are large and of a red colour. This was described as a species of yellow by Sir A. Mackenzie, and named after him. The whole plant has a sweet taste. It is a common plant.

H. lineare is used in Cochins China as a stomachic, and H. alpinum is used in Siberia for the same purpose. The P. C. S., No. 88.

H. senecioide of Wildenow, now Ormocarpum senecioideum, has a root which is used in India as a tonic and stimulant. The H. albiata of Linnæus is the Albiata marroanae of recent botanists. The flowers are yellow, scented, and in sweet substance like manna. H. tuberosum of Roxburgh, Pueraria tuberosa of De Candolle, grows in the Cinar mountains. The roots are used by the natives as pottish for swellings of the glands, not even excepting Achilleus. Hector is the favourite of his parents, and himself a happy husband and father. The reader need only be reminded of the beautiful passages in the 'Iliad' (vi. 369 f.), where Hector, before going to battle, takes leave of his wife and child, and where (xii. 271), amid the lamentations of his parents, he prepares himself for the contest with Achilles. Wherever the battle is fiercest, Hector is foremost, and his ally, Daunus, the son of Ares (Mars) and Apollo, he fights most courageously against the bravest of the Greeks, as Ajax, Nestor, Diomedes, and Teucer. He was foremost among those who stormed the Greek camp, and advanced as far as the walls that were about the city, and when the Trojans came forward and drove the Trojans back to their city, but was slain by Hector. This calamity roused Achilles from his inactivity, and he, determined to avenge the death of his friend, sought Hector, who, though implored by his parents to save himself, resolved to engage with his enemy. Achilles thrice chased him round the walls of Troy, and finally pierced him with his great chariot of fire, as a token of his ability to do a deed of value; and Hector, after being shot, was dragged by the chariot and dragged to the camp of the Greeks; at the funeral solemnities of Patroclus, it was dragged thrice around his tomb, and then thrown away to be devoured by the dogs; but it was preserved, as it is said, when the Scyths appeared as a suppliant before him and begged for it. The remains of Hector were buried at Troy, where funeral sacrifices were offered to Hector as a hero; at a later time, however, his remains are said to have been conveyed to Thessalian, in pursuance of an oracle. (Pausanias, iii. 19. 9; ix. 18. 4.)

HE'MECK, or Heemskerck, Merten, a celebrated Dutch painter, who was born at Heemskerck, near Haarlem, in 1481; he was the son of a peasant farmer, Jacob van Car, and though he is known only by the name of his birth-place. Merten was employed by his father in common farm labour, which was particularly distasteful to him. He had given evidence of a natural bent, and his father, being of a more favorable to his plan of becoming a painter. As he was returning home one evening with a pail full of milk upon his head, lost in a reverie about his future prospects, he came unconsciously in contact with a tree and fell over it, and was left, as he fancied, with a notion that he may have seen his father hastening up to him with a stick in his hand. His mind was instantly made up; he fled to Delft, obtained admission into the house of a painter of the name of Jan Lucas, and he too did not become a painter. He studied afterwards with Jan Schoorl, at Haarlem, and his earliest works of distinction were painted in the style of that master. After painting for some years at Haarlem with great success, he set out, in 1552, for Rome, but before he left he presented the Painters' Company at Haarlem with a picture of St. Luke painting the Virgin Mary, a picture which is much praised by Van Mander, and he also lent his long preserved with great care at Haarlem. In Rome, Merten, known as Martin Tedesco, distinguished himself as an imitator of Michel Angelo; the jealousy of the Italians, however, forced him to return to his own country, after a stay of three years in Italy. When he arrived at Dordrecht, he had a narrow escape of his life, for he put up, by recommendation from Rome, at an inn, which turned out to be a den of murderers, in which many travellers had perished; the story is told by Van Mander.

Heemskerck's early admirers were not at all pleased with the new style which he imported from Italy; however he found many new admirers, and he executed numerous works in this new style, which his earlier master Van Eyck had introduced to the school of the Van Eycks; his style was simple, earnest, and in character natural; in his later paintings he imitated in a manner the antique and the cinquecento style of Italy, but his caricatured the antiques, and he left the defects of the modern. There are scarcely any works by Heemskerck now at Haarlem; some were carried to Spain during the Spanish war, and many were destroyed by the iconoclasts in the riots of 1566. There is a Last Judgment by him at Hampton Court, and there are several of his earlier works in the Pinakothek, at Munich, which, however, show that he was not one of the best of the Van Eyck school. He died very rich, and, though he was twice married, childless, at Haarlem, in 1574. The engravings after his works, by various masters, amount to many hundreds.

(Van Mander, Het Leven der Schilders, &c.; Schoopen der schilders, Johannes Van Eyck en syne Nachfolger.)

HEERE, Lucas DE, a distinguished painter and poet, was born at Ghent in 1554. His father, Jan de Heere, was a good sculptor, and his mother excelled in snuff painting. Lucas was placed with Frans Floris, after he had made sufficient progress with his father to benefit by the instruction of Floris.

He Heere painted in France; and he was in England in the reign of Queen Elizabeth, whom he painted several times. There is a flattering allegory of her by him at Hampton Court; it represents Elizabeth as queen, and two maidens of honour, coming into the presence of Juno, Minerva, and Venus; the first is put to flight, the second is astonishe, and the last blushes; this is partly accertained by the follow.
ng Latin verses, probably by De Heer himself, written on the frame:—

Juno potens scintilla, aeris cornuque Palus, 
vestitu onerata spectabilis, 
Adstit Elisabeth; Juno previsae refugii 
Vindex deaque, adspice, et petis Elidem.

In 1570 Lucas was employed to paint a gallery for Edward earl of Lincoln, lord high admiral, in which he was to represent the customs of different nations. For England, says Van Mander, he painted a naked man surrounded by all sorts of weapons and silk stuffs, with a pair of scissors and a piece of chalk; and when the admiral asked him to explain it, Lucas said that he could not paint the Englishman in any particular costume, as he changed it daily; therefore painted him with his shirt and hose on, left and right side, to make his own clothes. This however, as Walpole has pointed out, was not an original device; it is prefixed by Andew Bordae, or Andrea Perusinus as he called himself, to his "Introduction to Knowledge," with the following lines:—

I am an Englishman, and ask I stand here, 
Mooting in my mind what manner I shall wear.

The principal of Lucas's poetical works was the Garden of Poetry, 'Boomgaard der Poëzie'; he commenced also in verse the "History of the Painters," but this was lost. He died at Ghent in 1584: he used for a monogramm an E and J, and he used also sometimes the following moral anagram of his own name, "Schade leer a" (injuries teach you). De Heere's manuscript and the general Venetian collection form part of the library of Copenhagen, jointly with his friend Tyschen, a journal on ancient literature and art ("Bibliothek der alten Literatur und Kunst"), and had a great variety of old printed books, for the "Transactions of the Royal Society of Göttingen." His activity was astonishing, and, in addition to all this, he began about the year 1800 to study the history of the middle ages and of modern times, and also lectured upon these subjects with as much applause as he had before obtained by his lectures on ancient history. It is further worth mentioning that Heeren's activity as an author was always in the closest connection with that of a lecturer, and before he wrote a work on any subject he had at least once or twice lectured on it in the university. Hence he always appears a master of his subject, and was enabled to give to his productions that finish and perfection which makes them popular in the best sense of the term, and which is certainly a rare characteristic of German writers. A great work relating to the history of modern times, and which is thought by some to be the best of his productions, bears the title "Handbuch der Geschichte des Europäischen Staatsystems und seiner Kolonien," Göttingen, 1809; a fourth edition appeared in 1822. A work on the influence of the Crusades ("Sur l'Ifluence des Crusades sur le Croisement et le Trafic. Inser lambres," Göttingen, 1780), translated into English and Dutch, and some of them are still regarded as standard works of their kind. On the death of Eichhorn, in 1827, he undertook the editorship of the "Göttingische gelehrte Anzeigen," as professor of history in the university, and professional duties, took up so much of his time that he was unable to complete his great work on the politics and commerce of the states of antiquity, although considerable preparations had already been made for it.

Heeren's merits were universally acknowledged. The academies of St. Petersburg, Berlin, Munich, Stockholm, Dublin, and Copenhagen showed their respect for him by electing him a member. He was also a member of the chief societies of London and Calcutta. In 1837 or 1838 Heeren, in conjunction with Uerdt, formed the plan of editing a series of works, containing the histories of the states of Europe. The best historians of Germany were induced to write histories for the series. The whole is not yet completed, but among those works there are some of the highest eminence, such as Lapennberg's "History of the States of Germany," and "History of the States of Sweden." Heeren died at Göttingen, on the 6th of March, 1842.
HEGENSIS (Hyrcania), a Greek rhetorician and historian, was a native of Magnesia, and lived about the time of the historian Timaeus, that is, about 250. Respecting his life no particulars are known, but as an author he appears to have been admired in ancient times, though more for his bad than for his good qualities. Strabo (iv. p. 648) calls him the founder of that florid and inflated style of oratory which was afterwards designated by the name of the Asiatic; and this testimony is borne out by Cicero (Cat. Orat. Ixx. 67, 69) and others. Hegenisis himself pretended to imitate the Attic orators, especially Lysias. He seems to have been destitute of all the qualities required of an orator, and to have taken refuge in the device of distracting the hearers by a variety of anecdotes, in order to avoid expressing them. This we must conclude both from the opinions of ancient critics as well as from the few specimens of his oratory which have come down to us, and are preserved in Cicero (Cael. 105), Quintus Curtius (Historiae, lib. v. cap. xxii. 5), and others (Cicero, Orat. 95, 250). As an historian he appears not to have been much better than as an orator. The subject which he chose was the history of Alexander the Great, but that he had no notion of the dignity of history is evident from the specimens given by Dionysius, Phutius, and Plutarch (Alc. 3) and A. Gellius (ix. 14) does not appear to be much mistaken in classing him among those who, unconcerned about historical truth and credibility, were content only with interesting and incredible stories. (Compare Strabo, iv. p. 396; Longinus, De Sublim., 3; Theon, Progymnasm., 3; St. Croix, Examen critique des Historiens d'Alexandre, p. 47, &c.)

From this Hegenisis we must distinguish HEGESIAS the Cynricus philospher, who lived somewhat earlier, in the reign of Ptolemaus Philadelphus, and was a disciple of Parabataes. His doctrines, however, differed in several points from those of other Cynricans, and so much so that his followers were regarded as a distinct school, and are called as such Hegenisitici (Hegyenicai) in the main points they agreed with those of the Cynics. In the matter of the maintaining that pleasure was the great object of man's life; but Hegesias and his school went further; they denied that kindness, friendship, and benevolence had any independent existence, and the feeling of the want of them. Happiness, they said, is a thing impossible to attain, for our body is subject to many sufferings, and the soul suffers with it. Life and death are equally desirable; nothing is by nature either agreeable or disagreeable, but becomes so through the circumstances in which a man lives. A wise person therefore looks upon life with indifference, and regards nothing and nobody so much as himself, reducing everything to his own convenience. This miserable view of human life was somewhat softened and improved by Anniceris, the disciple of Hegenis. Hegenis wrote a work entitled "Alexiropoia," in which he introduced a person named Oched, who advised his friends to use death, as death was more desirable than life. He seems to have taught philosophy at Alexandria, but as in consequence of his doctrines many persons destroyed themselves, King Ptolemy Philadephus is said to have forbad him to teach to any more. (Diogenes Laer., vii. 86, 93-96; Cicero, Tuscul., i. 54.)

HEINRICH, CARL FRIEDRICH, a distinguished German scholar, was born on the 8th of February, 1774, at Mooschleben, in the principality of Mansfeld. His father was pastor. He received his first education at the Kloster-schule of Dondorf, and afterwards at the Gymnasia of Gotha, where he was graduated in 1791 in philosophy, law, and other eminent sciences. Heinrich had read the principal Greek writers, even before he entered the Gymnasia, and his intimate acquaintance with them caused him to be looked upon as a wonderful boy. In 1793 he went to Göttingen, where he became the favourite pupil of Heyne, who made him his tutor. In 1797 he was appointed librarian at the Academy of Breslau, and in 1801 he obtained the title of professor. Boettiger, the eminent archaeologist, persuaded him to take an interest in the theatre in Breslau, and he finally exerted himself to raise its character, but wrote several dramas himself, and in the end became one of the managers of the theatre. In 1804 Heyne procured him the professorship of eloquence and of Greek of the University of Kiel. Philological studies had been greatly neglected there, and Heinrich at first lectured to empty benches, but he soon attracted a great concourse of students. In 1819 he was invited to a professorship in the newly-established University of Halle, and accepted the offer, and henceforth continued to lecture there until his death on the 20th of February, 1838.

Heinrich was a very excellent Latin scholar, though his lectures on Latin authors were very unequal. The best were those on the Satires of Horace, Juvenal, and Persius, for he himself had great satirical talent; his explanations always excited a most lively interest, being seasoned with his own wit and sarcastic allusions. The philological seminary of Bonn was much indebted to his exertions; but his personal character was anything but amiable: he was whimsical, inconsistent, and not unfrequently malicious. He published few works, but all of them have great merit; the following is a list of them:—1. "Epimenides aus Creta, eine kritisch-historische Zusammenstellung aus Bruchstücken;" nebst Zwei kleineren antiquarischen Schriften. 2. "In an excellent essay on the life of Epimenides and the works attributed to him." 2. "Lycyrii Oratio in Leocratorem," Bonn, 1821, 8vo. 3. An edition of Cicero's "De Legibus," 1828, 8vo. 4. An edition of "De Publici," Bonn, 1829, 8vo. 5. "Ebeleides." He wrote further critical essays in several periodical works, and was one of the editors of Köppen's German Commentary on Homer, in 6 vols., Hanover, 1764-1769. In the year after Heinrich died his edition of Juvenal, for which all preparations were made before, was published by his son, Bonn, 1839, 2 vols. 8vo., which is the best edition of Juvenal that we have. (See Long, in the Classical Museum, vol. i. p. 359, &c.) An editorial of Perius, for which Heinrich had likewise left the MS. ready, was published by Otto Jahn.

NEUER NORDERNEY (Nordische Lübbeck und Schröder, London, in the Programme of the lectures in the University of Bonn for 1888.)

HELIANTHEMUM, a genus of plants named from δαία, 'the sun,' and άνθεμος, 'a flower,' because the flowers open with the rising of the sun, and fall with the setting of the sun in the evening. This genus belongs to the natural order Cinneas or the family of the Compositae, and is included under the genus Cistus, but they differ materially in their characters. There are about 150 species enumerated, which are distributed in various parts of the world; they are mostly found in the southern parts of Europe. They are very showy, and a few species possess any available property in the arts or medicine, but they are extensively cultivated on account of their very beautiful and ornamental character.

Helianthemum, an erect herbaceous plant with oblong lanceolate or linear leaves, the racemes without bracts, and the stigma subsessile. The flowers are yellow, with a deep red spot at the base of each petal. It is a native of France, Italy, Spain, Portugal, and Turkey, and is found in Anglesey and Jersey in Great Britain, but is a very rare plant.

H. canum, the Hoary Sun-rose, is distinguished by its shrubby appearance, without stipules, and having terminal branched racemes. The florets are yellow, and are found in May. It is a native of the south of France and Germany, and is rarely found in Great Britain.

H. vulgaris, the common Rock-rose, is a procumbent shrub, with stipules, branched racemes, the style larger than the ovary, and bent at the base. The flowers are yellow, and bloom from May to September. It is a native of Europe, and is found in dry hillsly pastures. There is a very beautiful variety with double pale yellow flowers, which is much cultivated by florists. The stem, if touched in the sunshine, spread slowly, and lie down upon the leaf.
Almost all the species of Helianthemum are elegant plants, of hardy growth, and easily cultivated. They grow best in a light sandy soil, and should be protected during the winter in a frame.

**HELIOTROPION** (from Ηλιοτροπιον, the sun, and τροπιον, a turning), a genus of plants belonging to the natural order Erythrocypreales, a sub-order with corolla, with the threads usually naked, but in some species bearing the segments of the limb furnished with a single fold or a tooth between each; the stigma sub-conical; the carpels 4, 1-celled, combined, clovened without any many-lobed receptacle. The species are annual or shrubby plants, with alternate leaves, and ciliate spikes of small blue or white flowers.

*H. Parviflorum*, Peruvian Heliotrope or Turnsole, has a shrubby stem, pedate oblong-lanceolate wrinkled leaves, terminal branched spikes; the tube of the corolla hardly the length of the calyx. The mouth of the corolla is intersected with five placentae of a purple-like colour with a greenish throat. It is a shrub, growing one or two feet high, and is much cultivated on account of the scent of its flowers, which resembles very much the smell of the vanilla. It is a native of Peru.

*H. Europaeum*, the European Turnsole or Heliotropes, has an herbaceous erect stem, with ovate flat-topped finely tomentose leaves, the lateral spikes solitary, the terminal ones confluent, the calyx spreading in the fruit-bearing state. It is a native of Europe and of the islands of the Archipelago. It has large white corollas with a yellow throat. This species is the *Heliotrope* of Dioscorides (t. 146) and of H. H. *Eupatorium*, the *Heliotropium*, the *Heliotropium*. Upwards of eighty species of this genus have been enumerated. They are natives of the warmer parts of Europe, Asia, Africa, and America, and are found in New Holland. They do not possess any active property.

Many other species besides those here described have sweet-scented flowers, and are cultivated on that account. Some of them are consumed in large quantities by perfume makers for the sake of their volatile oil. They are aromatic and also mucilaginous, and potlicace made of the leaves have been applied to acanthaceous and sclerousorous sores. It is supposed that the plant used for the cure of urchins, and called "Tververcia," belonged to this genus. In their cultivation the shrubby and perennial kinds will be found to thrive in any kind of rich light soil, and cuttings will root readily in sand under a hedge. Some species can be propagated from seed sown in an open border, while the typical annual species must be sown upon a hot-bed before being planted out.

**HELL, MAXIMILIAN**, a distinguished astronomer and member of the order of Jesuits, was born May 15, 1720, at Schemnitz in Hungary, and manifested, at an early age, a decided taste for the study of natural Philosophy and Astronomy. At twenty-five years of age he was employed as an assistant in an observatory belonging to the Jesuits at Vienna, and he was at the same time keeper of the museum of experimental philosophy which had just then been formed in that city. In 1746 he was made rector of an academy at Leutschau in Hungary; but this post he held only one year, when he returned to Vienna. Here he completed his theological studies, and filled a small number of places, which he had instructed in mathematics. He took orders in 1751, and after three years he obtained the rank of doctor, with an appointment to the professorship of mathematics at Clausenburg in Hungary. Having continued five years in that capacity, he again returned to Vienna, where he was established in an observatory which had been built in conformity to his own directions; and he held the appointment during the remaining years of his life. Besides his own observations, he was charged with that of giving lessons in mechanics; as, in England, about eighty years earlier, the first astronomer royal was required to teach the use of mathematical instruments to boys from the Royal Hospital: the German astronomer, however, gave the lessons only during one year, his time afterwards being fully occupied in performing services more important to science.

Through the mediation of Count Bacheho, who was sent from Copenhagen for the purpose of making the proposal, he accepted an invitation from the court of Denmark to undertake a journey to Wardhuya in Lapland, in order to observe there the transit of Venus over the sun’s disc. Accordingly he set out for Copenhagen in 1758; and, on the 3rd of May, the same year, at the time of the transit, he proceeded to the place of his destination: he was absent about two years and a half on that mission. On his return, having fully surveyed the state of the arts among them: he made also numerous observations on terrestrial magnetism, on the phenomena of the tides and winds, and on the variations of the barometrical column; and he measured the heights of the principal mountains. After his return he prepared a work containing a full account of his researches, which was to have been published in three volumes, 4to., but it never appeared.

Hell was very fortunate in the sky being favourable, on the day (June 3, 1769) that the transit took place, so that he was enabled to observe the interior contact at the commencement, and both the interior and exterior contacts at the termination of the phenomenon; and it is a proof of the accuracy of his observations that the value of the sun’s parallactic, which he deduced by comparing them with the corresponding observations at certain other places, agreed, within one-fifth of a second of arc, with the observed value, and with all the comparisons with all the best observations which were made.

On accepting the engagement, Hell was enjoined by the Danish ministry to abstain from publishing any account of his observations which was not required by the international correspondence. It was in this way that he only published the results of eight of his investigations, which were all the requisite computations. The delay, which, in consequence of this injunction, took place in making Hell’s observations public, gave offence to Lalonde, who had, by letters of recommendation to the governments of Europe, greatly promoted the measure of observing the phenomenon at different places on the earth’s surface; the two astronomers were however soon reconciled, and they continued to correspond with each other as before; and his memoir relating to the transit, which was read before the Academy of Sciences of Copenhagen, November 24, 1769.

The principal work published by this astronomer was a series of Ephemerides in thirty-five volumes, 8vo., the collection being entitled "Ephemerides Anni 1757—1791 ad Meridiam Vindobonensem Calculis Definitis." With the exception of two volumes, these constitute the astronomical works of this astronomer, who, besides his original investigations, had published a treatise on the theory of the moon (1777, 1779, 1781), and a work on the subject of navigation (1777, 1781, 1784). He also published a collection, which had been made by Hallstein, of the astronomical observations made by the Jesuits at Fekin from 1717 to 1725; this was published at Vienna, in 2 vols. 4to., in 1768.

Besides these works he published: "Elementa Algebræ J. Crivelli," 8vo., 1754; "Adjunctionem Memoriae Manuale Chronologico-Genealogico Historici," 16mo., 1750; "Elementa Arithmetica Numerique et Literarum," 8vo., 1763; also a tract on the construction of the naked eye, 1779; and one on a New Theory of the Aurora Borealis, 1776.

All his works were published at Vienna; and he died there, in that city, having finished seventy-two years of age. A brother of Hell was a distinguished mechanic at Schemnitz, and the inventor of a sort of siphon for draining mines: this is described in the "Memoires de l'Academie des Sciences," where the making celestial instruments was described.

**HEL, WIND, P. C.**

**HELINCHECORTON. (See Wicz, P. C.)**

**HELDOUS. (See Sessis, P. C. S.)**

**HELOSCIAD, a genus of plants belonging to the natural order Umbelliferae and to the tribe Aminaceae. It**
has a calyx of 5 teeth or obsolete; the petals ovate, entire, with a straight or curved apiculus; the fruit ovate or oblong; the seeds few, the testa of the seed obovate, subelliptic, with the testa occluding the apartment of the styles with single vitre, the carpophore entire. There are three British species of this genus. H. nodiflorum, with the leaves obtusely serrate; H. repens, with the leaves obtusely serrate; and H. innotatum, with the leaves of the lower leaves divided into capillary segments. The first is a native of brooks and ditches, and is frequently mistaken for the water-cress, H. natans. The second is a native of polystichum, and the third is a rare plant in Great Britain. The last species is found in ponds.

(Babington, Manual of British Botany.)

HELSTON, a market town and parliamentary and municipal borough, in the hundred of Kerrier or Kirrier, in the county of Cornwall, 296 miles south-west of General Post Office, London; viz., 197 to Exeter by railway, and from thence 98 miles by coach road through Ockhampton, Launceston, Bodmin, and Truro. Helston was made a borough by King John (A.D. 1201). According to Lysons, the townsmen paid him forty marks of silver and a palfrey that their town might be made a free borough. King Edward I., however, gave one of the coinage towns; and sent member to Parliament from his reign. There was a castle here in which Edmund, Earl of Cornwall, cousin of Edward I., resided at one time, but it was afterwards neglected that it was in ruins in the time of Edward IV.; and the town itself was in the reign of Henry VIII. one of the decayed towns for the repair of which an act of parliament was passed. The town stands on the eastern bank of a small stream, the Lo or Low or Loo which forms about a mile below the town a wide expanse of water called Lo-pool. The river Hel or Heyl, distinguished from another stream of the same name in the county, as the Heyl in Kierrow, and sometimes called the Helford, flows about two miles east of the town, or rather less. The streets are irregularly laid out; but are paved and lighted with gas, and the town presents a neat and clean appearance. The market-house and townhall are near the centre of the town, and the ancient coinage-hall stands at the end of a street to which it gives name. There are no remains of the castle. The Church dedicated to St. Michael is a modern building of white moorstone (granite), erected by the Earl of Godolphin in A.D. 1708. There is a baptist meeting-house and a Wesleyan chapel.

The population of the old borough and chapselly which has an area of 130 acres was in 1841, 3584; the number of houses was 763, viz., 682 inhabited, 66 uninhabited, and 15 building. The number of houses in 1881 was only 616, viz., 581 inhabited, 32 uninhabited, and 13 building; so that the increase of population in the ten years 1831-41 was 291; and the increase in the number of inhabited houses, 101. The town is the centre of an important agricultural and dairy district. In 1835 it had a population of 6572 on Wednesday and Saturday; and there are several fairs or great markets in the year. A great number of shoes are made in the town, and are sold at the markets and fairs; or are sent to and sold at London and other towns. The town is the seat of a new court of Quarter Sessions, held on the third Tuesday of each month. The Act returned two members, now returns only one; the old borough was, for parliamentary purposes, enlarged by the addition of the adjoining parish of Sithney and of a considerable part of the parish of Truro; but the borough is now in a prosperous condition, and we have no means of ascertaining the number of electors on the register in 1824-36, as 556, in 1839-40 it was 406, showing an increase in four years of 50 voters. The town is a polling station for the western division of the county of Cornwall. By the Municipal Corporations Reform Act, the borough has 4 aldermen and 12 councillors, but was not to have a commissioner of the peace except on petition and grant. The old municipal boundaries have not been altered. The living is a perpetual curacy united with the vicarage of Wendron, of which parish the chapel of Helston is a dependency; the church is the ancient one, the united bests in 1675, with a glebe-house: it is in the rural deanery of Kierrow, in the archdeaconry of Cornwall and the diocese of Exeter. There were in the chancel of Helston in 1833 two national schools with 190 children, viz., 127 boys and 63 girls, and five other day or boarding schools with 125 boys, 66 girls and 40 children of sex not stated, giving a total number of 599 children, or about one in eight of the population (according to the then recent census of 1831) under daily instruction. There were at the same time two Sunday-schools with 446 children, viz., 127 boys and 135 girls connected with the two dissenting congregations. (Lysons, Magna Britanniæ (Cornwall); Municipal Corporations Commissioners, Reports, Population Returns and other Parliamentary Papers.)

HELVELLA. [HYMENOPTERAE, P. C. S.]

HEMANS, Felicia Dorothea, was born September 25, 1794, at Liverpool, where the family name was Browne, was engaged in mercantile pursuits. He was a native of Ireland; her mother was an Englishwoman, but was descended from a Venetian family, through her father, who was commercial agent at Liverpool for the Venetian government. Felicia Dorothée Browne was the fourth child of a family of three sons and three daughters. About the year 1800 Mr. Browne, in consequence of the failure of a mercantile concern in which he was engaged, removed his family from Liverpool to an old mansion, spacious and solitary, called Grywyth, not far from Abergele, in Denbighshire, North Wales. Mr. Browne died not long afterwards. Felicia Browne began to write before she was nine years of age, and her mother, a woman of education and taste, was her first confidant and encourager.

Miss Browne's first volume of poems was published in 1808, and contains some verses written by her as early as 1803 or 1804. A harsh review of this little volume affected her so much that she was confined to her bed for several days. Her second volume, 'The Domestic Affections,' was published in 1812.

In 1812 Miss Browne became the wife of Captain Hemans, of the fourth regiment. His constitution had suffered so severely in the retreat upon Corunna, and subsequently by fever caught in the disastrous Walcheren expedition, that he felt it necessary, a few years after their marriage, to exchange his native climate for that of Italy. This at least is the motive assigned for his leaving his wife; but their union, it is said, was not happy, and this separation, which took place just before the birth of her fifth son, closed it for ever. Mrs. Hemans, with her five sons, went to reside with her mother, then living at Bronwynt, near St. Asaph, in North Wales. Mrs. Hemans now resumed her literary and poetical pursuits with increased ardour. She studied the Latin, Italian, Spanish, Portuguese, and German languages. She made some translations from Horace, Herrerius, and Camoens, and contributed a series of papers on Foreign Literature to the Edinburgh Magazine. 'The Restoration of the Works of Art to Italy' was written for a Taunt on the 'Lettres Historiques,' in 1819; and, about the same time, 'The Spartan,' a didactic poem, in heroic rhyme; and 'Modern Greece,' in ten-line stanzas. Her poem of 'Dartmoor' obtained the prize from the Boyce Society for 1826.

When about twenty-five years of age, Mrs. Hemans became acquainted with the Rev. Reginald Heber, afterwards Bishop of Calcutta, who passed a part of every year at Bodryddian, near St. Asaph, with whom she formed a lasting friendship. At his suggestion she wrote her first dramatic work, the tragedy of 'The Vespers of Palermo,' which was represented at Covent Garden Theatre, London, in 1823. It was unsuccessful there, but was afterwards better received at Edinburgh, when Walter Scott wrote an epilogue for it. 'The Siege of Valencia, the Last Constantine, and other Poems' was published in 1826.

In 1825 Mrs. Hemans was married, with her mother, her sister, and her own sons, to Rhyllion, near St. Asaph. Her sister had returned, in 1821, from Germany, where one of her brothers was attached to the Vienna embassy, bringing with her a fresh supply of German books, and Mrs. Hemans's delight in German literature may be dated from that time. Her 'Lays of many Lands,' most of which appeared in the New Monthly Magazine, then edited by Thomas Campbell, were suggested by Herder's Stammtische Abhandlungen, and, preceded by 'The Forest Sanctuary,' formed her next volume, published in 1827, which was followed, in 1828, by the Records of Woman. Most of these poems were written at Rhyllion, and many of her verses were written in the home of her brother, the melancholy occasioned by the recent death of her mother, for whom her affection was always exceedingly strong. In the autumn of 1830 her marriage of her sister, and the removal of her brother, who was going to army, in Ireland, Mrs. Hemans established herself at the village of Wavertree.
near Liverpool, in the expectation of obtaining good schools for her children and pleasant society for herself. She had little success in either of these objects. The schools were not such as she wished for; her house was inconveniently small; she could not attend the parties, regimented fashionability, and parties, and complains with some bitterness of ‘this weary celebrity.’

In the early part of the summer of 1829 Mrs. Hemans paid a visit to her friends in Edinburgh. She proceeded to Chiswick, in Roxburghshire, the residence of the author of ‘Cyril Thornton,’ and was there introduced to Sir Walter Scott, with whom she afterwards spent several days at Abbotsford. She returned to Edinburgh in August, and thence proceeded home to Wavertrie.

In 1830 she published another volume of poetry, ‘The Songs of the Affections,’ and in the summer of the same year paid a visit to the lakes of Cumberland and Westmorland. She remained a fortnight with Wortworth at Rydal Mount, and then took up her residence at Dove-Nest Cottage, near Ambleside. After remaining some weeks, she was induced to make a second visit to Scotland, on which occasion she spent the greater part of the time at Milburn Tower, the seat of Sir Robert Liston. During this visit she formed a friendship in consequence of which she was induced to visit Dublin before she proceeded to Wavertrie, and ultimately decided on leaving England, and fixing her abode at Dublin.

In the spring of 1831 Mrs. Hemans left England for Dublin, where she took lodgings. Her health, from the time of her leaving England, had been as rapid as the advancing age of the sons remaining under her care was an additional cause of anxiety. ‘My position,’ she writes, ‘obliged as I am to breathe a stormy world alone,’ precluded the formation of friends in Dublin, of which she had a great desire. In November, 1831, after a visit to her brother in Kilkenny, she writes thus to a friend in England:—On my return to Dublin I became a sufferer from the longest and severest attack of heart-ailment I have ever experienced. It was accompanied by almost daily fainting fits, and a languor quite insensible. And not long afterwards, in the same letter, she says:—The constant necessity of providing sums of money to meet the exigencies of the boys’ education has obliged me to waste my mind in what I consider mere desultory effusions.

Pounding myself away,
As a wild bird amid the foaling stars,
That which with him thrills and beats and burns
In a light of fire.

In January 1834 the latter months of 1833 were busily spent by Mrs. Hemans in arranging and preparing for publication the three collections of her poems which were published in the spring and summer of 1834: ‘Hymns for Childhood;’ ‘National Lyric and Sonnet;’ and ‘Muses of Life is a Mirror.’

In August, 1834, Mrs. Hemans took the scarlet fever, and when imperfectly recovered, caught a cold; and soon after her illness, she was declared to be in a state of critical illness. In November 1834 she was again taken ill of an illness which before November of 1834 had always been considered an unusually dangerous attack. The summer residence of the Archbishop of Dublin was placed at her disposal; change of scene and the kind attentions of the archbishop and his wife afforded some relief, but no permanent benefit; and in order to be near to her physicians, she was taken back to Dublin.

On the 26th of April, 1835, Mrs. Hemans dictated her last poetical effort, the ‘Sabbath Sonnet.’ She continued to sink gradually till May 12, 1835. She died, after a long and quiet sleep, without a sigh or movement. She was buried in St. Asaph Church, Dewar’s Brindley, Dublin, which is close to the house in which she died. A tablet erected by her brothers in the cathedral of St. Asaph, in memory of Felicia Hemans, whose character is best portrayed in her writings. A volume of ‘Poetical Remains’ was published after her death.

Mrs. Hemans could hardly be called a beautiful woman, but her personal appearance was very pleasing. In early youth she was noted for her graceful figure, the elegance of her complexion and her glossy golden hair; her complexion retained its clearness in her mature years; her hair darkened into auburn, of a silk-like softness, and very long and abundant. In her later years she became more something than usually delicate and coquettish. She was slight, graceful, and well proportioned and faultlessly into general society. Her family, a few friends, her music, her books, and her poetical pursuits, were her chief sources of enjoyment. She played on the harp and piano-forte, and about the time when she went to reside at Wavertrie, discovered in herself a faculty which gave her much gratification—that of composing melodies; she could sometimes be heard to revolve a theme or two in her mind for it, and sometimes set to music a song or a lyrical piece already written. Among her friends she was distinguished by much vivacity and a very delicate wit. She was kind and generous to her friends as to her enemies. She was not at all afraid of the world, and mixed freely and naturally with all classes of people. She was not at all afraid of the world, and mixed freely and naturally with all classes of people. Mrs. Hemans’s love of the art to which she had devoted herself was intense, and her appreciation of it was serious and high, as a means to purify and elevate the mind. In her later years her religious impressions became stronger, and her poetry became more tinted with religious thoughts and feelings. Her knowledge was extensive, but it was not philosophical or scientific knowledge. Poetry was the object of all her studies, and she sought for its materials in history, voyages and travels, and the fine arts; but her especial delight was to contemplate the scenes of nature in all their aspects of beauty, and to muse upon the associations and sympathies connected with them. Her thoughts are unreserved, are never vague or indistinct, and always seem to flow naturally from the scene or circumstance present to her mind. She is most successful when the subject is native, something which she herself has often experienced. She calls up the sympathies which are familiar to her. In foreign subjects she is less effective. Her poetry is thus peculiarly and strikingly the representation of her own character, of her thoughts and feelings of the moment. Her thoughts and feelings are lyrical and descriptive, filled with imagery, sometimes over-flowing with it. She has no dramatic power; she cannot enter into the thoughts and feelings of others; she can only exhibit her own. Her tragedy seems rarely consummated. The actions and sentiments of the characters are above nature or out of it, and the diction is not dramatic, but poetical, and monotonous and uniform from point to point. Her versification has three distinct styles. Her ‘Domestic Affections,’ and other early poems, are obviously modelled on ‘The Pleasures of Hope,’ of Campbell; her ‘Tales and Historic Scenes,’ and other poems of the middle period, are in the manner of Byron, less flowing than her early style, but more vigorous. Her last style is her own, and whetted in blank verse, in couplet rhymes, in stanzas, in sonnets, or in the varied measures of lyric poetry, and continuous and continuous flow a perfection of rhythmical melody which in sweetness and fullness of sound has never been surpassed. In uninterrupted reading, however, it has an effect of cloying uniformity. The style which she employs in her later works is light, graceful, and continuous and continuous flow a perfection of rhythmical melody which in sweetness and fullness of sound has never been surpassed. The eggs of Hemerobii are deposited on plants, and are pedunculated, so as to resemble fungi, for which they have sometimes been mistaken. These insects range from Europe to Australia, and there her results are not extensive native species. HEMICID/DA/RIUS, a genus of fossil Echionidicrana, from the oolite.

HEMIPNEUSTES, a genus of fossil Echionidicrana, from the chalk quarries.

HEMISTRYPA, a genus of fossil Polyporia, in the limestone of Devonshire, allied to Fennusthes. (Philippi.)

HEMIPRENATRICA [Mites], Hops, P. C. S.]

HENDERSON, THOMAS, was the son of a respectable tradesman at Dundee, where he was born December 28, 1798. After an education such as his native town could
The private character and social qualities of Mr. Henderson are among the pleasant recollections of those who knew him. In his astronomical career he resembled his friend Mr. Baily in bringing to the position of Astronomer Royal a mind as well fitted as his own for doing business. He was well acquainted with astronomical literature, and with other branches of science; and at different times supplied the places of the professors of mathematics and of natural philosophy in the Universities of Heidelberg and Berlin. He formed a great attachment to the methods of the German astronomers, and his models and works were MM. Besel and Struve. His determination to be well prepared for his work abroad made him collect an astronomical library which, for a man of his very limited means, was of extraordinary extent and goodness; and those who knew him remember the ready manner in which he could produce the results of his reading. Of his writings we may say, briefly, that, in addition to their valuable masses of observations, they abound in all that distinguishes the astronomer, properly so called, from the noter of phenomena.

HENRICO CATERINO DAVILA was born at Pieve di Sacco near Padua, was the son of Antonio Davila, who was a great constable of Cyprus when that island was taken by the Turks from the Venetians in 1671. He was the son of a navigator and the grandson of an officer in the service of Venice, who had relations, and afterwards to France, where he won the favour of Catherine de Medicis, and of her son King Henri III. Lastly he went to reside in the Venetian States, where a son was born to him. Mr. Davila's first work was the establishment of the names of Henrico Caterino, in homage to his royal French patrons. When Henrico was seven years old his father took him to France for his education. At the age of eighteen he entered the army under the command of Gascier, and, after five years, was severely wounded at the siege of Honfleur. In 1599 he was recalled to Pieve di Sacco by his father, who, soon after his return, died, and Henrico, unprepared for life by throwing himself out of a window. Not long afterwards Henrico entered the military service of Venice, and was employed successively in Candia, Friuli, Dalmatia, and other stations. In 1638 he was sent to take the command of the garrison of Crema, with or sans from the senate to the postmasters on the road to supply him with every convenience required for the service. On arriving at the stage of S. Michele, near Verona, the postmaster refused to furnish the necessary accommodations. High words ensued, and the postmaster fired a pistol, and shot Davila dead in sight of his wife and children. One of Davila's sons attacked the murderer, and killed him on the spot; others were wounded in the affray, and the chaplain of Davila was also slain.

Davila is known to the world through his History of the Civil Wars in France, ‘Storia delle Guerre Civili di Francia,’ from the death of Henri II. to the peace of Vervins in 1559, a period of forty years most eventful in the history of that country. He treats, therefore, upon the same ground as De Thou in his ‘Storia sui Tempori.’ Some critics have noticed that Davila’s history is less historical than dramatic, and especially for Catherine de Medicis, who had been his father’s benefactress. The facts, however, stated by Davila are acknowledged to be true, and he was well acquainted with them through his intimate acquaintance with his father. He was familiar with the politics of his age, and with the leading contemporary characters. He was also well acquainted with the topography of the places in which most of the events which he narrates occurred. His style is graphic and animated, especially when he describes a popular insurrection, a combat, or the storming of a town. His account of the massacre of St. Bartholomew may be read with the utmost satisfaction. Apostolo Zeno, comparing Davila with Guicciardini, observes, that whilst the prolixity of Guicciardini in dwelling minutely upon minor matters becomes wearisome to the reader, the course of Davila’s narrative runs on uninterrupted, adhering briefly to circumstances of subordinate importance, and dwelling chiefly upon those which have materially affected the interests either of religion or the state. By common consent Davila is numbered among the best historical writers of Italy. The bulk of his work has gone through many editions, and has been translated into several languages. Apostolo Zeno published a splendid edition of it in 2 vols. fol. Venice, 1735, to which he has prefixed a life of the author. (Tiraboschi, 'Storia della Letteratura Italiana; Corniani, 'I Soci di Quaella Letteratura Italiana.)

HENRYSON, Sir P.-s, a Scottish poet of much merit, lived in the latter part of the fourteenth century. Of his life hardly anything is known. He is supposed to have been the
Robert Henryson whose signature as notary-public is attached to a charter granted in 1478 by the abbot of Dunfermline, in Fifeshire; and he is elsewhere said to have been a schoolmaster in that town. It has been inferred that he must have been an ecclesiastic; and it has been inferred that he may have been a Benedictine monk. In a poem of Dunbar, printed in 1508, he is spoken of as dead: and in one of his poems he had described himself as a man of age. His tale of Orpheus Kyng, and how he went to Iverna and to hel to seek his quene was printed at Edinburgh, in 1508: and in 1568 there was printed his Testament of Faire Creseide, which had been suggested by the Troilus and Creseide of Chaucer, in the edition of 1568, in the common editions of that poet's works. His beautiful pastoral of Robin and Makynye is now known to most readers from Percy's Reliques. Other specimens of Henryson's poems are in Sibbald's Chronicle of Scottish Poetry, in Dr. Irving's Lives of the Scottish Poets, and in Ellis's Specimens. The fullest collections of them, however, are in Lord Hailes's Ancient Scottish Poems, 1770, and in a volume containing his thirteen poems, called Fablia, edited by Dr. Irving in 1834, for the Bannatyne club. For that club, in 1824, Mr. George Chalmers had edited the Testament of Creseide, and Robin and Makynye. Henryson writes with much greater purity and correctness than most Scotsmen of his time; his versification is good, and his poetical fancy rich and lively.

HEPATITIS. [LIVER, DISEASES OF, P. C.] A genus of plants belonging to the natural order Umbelliferae and the tribe Peucedanee. The cayx consists of 5 minute teeth, the petals abortive with an infixed point, the outer ones radiant. There are 34 species native to this part of Europe, found in Great Britain, and few are applied to any useful purpose.

H. Sphondylowum, Cow Parsnip, has tunicate pinnate leaves, the leaflets banded or pinnatifid, cut, and serrated. The stem is about four feet high, the leaflets very large, and the flowers white or reddish. It is a native of Europe, and probably of Siberia, and is found plentifully in the meadows and heath of Great Britain. The whole plant affords wholesome and nourishing food. It is often called the cow parsnip. The thistles, in Sussex and the neighbouring hogs; hence it is sometimes called hog-cow. Cows and rabbits are also fond of it, and horses will sometimes eat it, but it does not appear to be so agreeable to them. The Kemptihalitae and Russians are in the habit of using the shoots and leaf-stalks as food, after the rind, which is bitter, has been taken off. They collect large bundles of the plants, and during the process of drying the stalks become covered with a savoury efflorescence which is esteemed a great delicacy. The Russians distill an ardent spirit from the stalks thus prepared by first fermenting them in water with barley. The seeds of the plant are diuretic and stomachic, and excite a powerful salivation.

H. Rubescens has tunicate leaves, somewhat pubescent beneath; the leaflets toothed and pinnatifid; the umbels of many flowers, to 2 leaves; the fruit ellipitic, having the disk rather villous. It is a native of Turkestan in that part of the Caucasus and the Caucasus in Alpine places. The young shoots are filled with a sweet aromatic juice which is eaten by the natives of this country. It is native to the Eastern and Central Pyrenees, and of Italy. D. Don thinks that this plant is identical with the H. gummiferum of Willdenow, which was supposed to yield the gum ammonicum of commerce, but is now however identified with a plant which yields this gum, and has placed it in a new genus. [Dorset, P. C. S.]

All the species of Heracleum grow well in any soil, and are easily increased by seed or by dividing the roots.

(Don, Gardner's Dictionary; Burnett, Outlines of Botany; Babington, Manual of British Botany.)

HERACLITUS, Roman emperor from A.D. 810 to 641. Son of the nobleman C. Heracleides. In the Roman era he is called xonia, containing the life of this great emperor, the importance of his ministries, and the adjacent countries as regards Europe has been much increased, and accordingly it appears useful to give a few additional descriptions of the country, the religion, the Persians, which are of equal interest for the historian, the geographer, and the soldier.

The deistate condition of the empire at the accession of

Heracletus compelled him to be an almost inactive spectator of the ruinous invasions of the Avars in Europe and the Persians in Asia. By submitting to an annual tribute of one thousand talents (pounds?) of gold, as many talents of silver, one thousand horse, and all the silk robes, and one hundred and eighty slave-maidens, he was able to quiet the Persian king Choresme or Khorwar to discontinue his invasions of Asia Minor and to be satisfied with the conquests he had made from the Greek empire, which comprehended Egypt and the whole of the Asiatic provinces east and south of a line drawn from the northern frontiers of Syria to the eastern extremity of the province of Pontus. Heracletus made a less humiliating peace with the Avars. Having got rid of his enemies, he began to attend to his own affairs, which were somewhat disarranged by the pillage of the property of the churches; and he was thus enabled to raise an army strong enough to stop all further designs of the Persian king. The plan of attacking that powerful foe was bold and well designed, and it was executed with so much boldness and prudence, and such a startling combination of offence and defence, as to equal the strategical operations of the greatest geniuses.

A powerful Persian army was stationed in the valley of the Upper Euphrates ready to descend through the passes of the Anti-Taurus into the high plains of Cappadocia, and to push on towards Constantinople as they had done in A.D. 616. The army of Heracletus, consisting chiefly of raw levies, was quartered in the environs of Constantinople, and afterwards in those of Chalcodon on the Asiatic shore of the Bosporus, and, after a whole winter, was transported to the opposite bank of the strait. But Heracletus was master of the sea, and his numerous fleet enabled him to choose his base of operation. Early in the spring of 622 he embarked his troops, and from the Bosporus was able to land them at the mouth of the river, on the bay of Iskinderin (Alexandria), and is protected on the north and east by the Taurus and on the south by Mount Amamus. There on the plains of Issus he continued accustoming his troops to actual warfare by making them manoeuvre in the same way as modern troops do, and he occupied the Cilician and Syrian gates and other passes that lead through the surrounding ranges. A Persian army approaching in full force, but finding no enemy to meet them, they were glad to re-embark, was turned, routed, and driven into the mountains of Armenia. Having thus cleared his way and secured his rear, Heracletus marched through the Cilician gates northward in the direction of Mount Argeus (Arijal) and the Upper Halya (Kizil Irmaq), where, as seems a portion of his troops remained during the winter as a body of observation. The emperor with the main body advanced upon Trebizond, and quartered his troops in the province of Pontus. Trebizond now became the centre of his operations. He left it, however, soon after his arrival, sailed to Constantinople, and in the following spring of 623 returned with a fleet and a chosen body of his troops. It is impossible to give a correct idea of the army, for conveying his army by sea to the south-eastern extremity of Asia Minor, and thence fighting his way through inaccessible passes to the right across Asia Minor and through the Euxine, if he intended to march towards the base of his operations into Trebizond, for it seems that he could have gone there directly from Constantinople without incurring the risk of losing half his army, and perhaps all of it, in the defiles of the Anti-Taurus. Our sources say nothing of his motives, and generally we know few details of his first campaign. However, if we take the state of the empire into due consideration, and draw conclusions from his subsequent campaigns as to his first, we cannot hesitate to believe that Heracletus intended to attack Persia from two points, each of them equally well situated for an attack and affording equal security in case of a forced voluntary retreat. And it is probable that he chose the bay of Iskinderin for his place of disembarkation, and thence marched towards the Euxine, because he wanted to relieve, through his presence at the head of an army, the minds of those of his subjects who were most exposed to the inroads of the Persians, and to occupy as many mountain-passes as possible in order to prevent the Persians from breaking through the defiles between Cappadocia and the Black Sea. As he advanced to the Upper Halya, he divided his army.
especially the Mediterranean, and lands sufficient forces as either of those points, will effect or prevent the conquest of all Asia Minor and the adjoining eastern countries with less force and in a shorter time than any power which is only a land power. The outer powers of the Mediterranean and the western provinces from the defence of his hereditary dominions, and thus to relieve his subjects and increase his means.

From Trebizond Heraclius carried the war, in the spring of 624 into the heart of Persia. The nations in the Caucasus were his allies, and he had entered into negotiations with the khazars beyond the Caucasus. These were the causes of his first advancing north-east into the Caucasian provinces, and only after having shown himself there and increased his army through the contingents of his allies, he marched south upon Charsa (Kars) and thence in a direction parallel with the Araxes as far as the great bend of that river, where, after a south-eastern and eastern course, it turns north-east. Thence he marched right upon Ganza or Gaudza, which is the still common Armenian name of Tabriss, and this city fell into his hands with all its wealth, Choreses, who had been defeated by the Persians and driven out of the region, and that he might offer battle for the relief of his northern capital. According to an absurd tradition Cressus, King of Lydia, had saved his treasure and his diadems which he was kept till then, because they became a trophy of Heraclius. From Ganzas Heraclius advanced south, turned the Persian army and fell upon their rear, took and destroyed Thabarmas, now Ordinianyeh, near the western shore of the Araxes, where he was born, the birth-place of Zoost.Should, and many other cities which have not yet been identified, and at last wheeled round and took up his winter-quarters in the flat country between the Lower Araxes and the Caspian, which is now known as the plains of Mogun. We may suppose that he chose that tract, which is renowned for its vast pasturages, for the support of his numerous cavalry, and for the purpose of having an easy communication with the Khazarus and the eastern provinces of Mesopotamia, and the Iron Gate, near Derbent, whenever they invaded Persia.

In the following year, 624, Heraclius penetrated into the heart of Media, took Casbin, and probably also Aspahan (Ishafan), defeated Choreses in a pitched battle, and, after having carried the Roman army farther into Persia than any of his predecessors, returned to his former winter quarters at the foot of the Caucasus.

Our knowledge of the campaign of 624 is very imperfect; the accounts in the sources are vague and scatty, and the whole is so obscure that D'Anville gave up the idea of investigating it critically.

During this time Choreses had withdrawn his troops from Egypt and Syria, and thought himself strong enough to act on the offensive. In the spring of 625 he ordered his lieutenant Sarbar, or Sarbarus, to menace Asia Minor, while Heraclius took up his headquarters in the Caucasus. Sarbar was in Northern Mesopotamia; however, he did not take his way through the inland tract, which he had to besiege and capture the place of Khassar, Maladit, and Amasia, through the province of the Khassars and the north-eastern part of Caucasus, and in the direction of the Caspian and Kaisariyeh through the centre of Cappadocia; but he marched south-west and fell upon the eastern angle of Cilicia. His intention was apparently to take the easiest way for penetrating into Asia Minor, to cut off the communication between the Romans in the fortresses of the Khassars and the to the ruined bastions of the Caucasus, and to destroy the magazines of the Romans in Cilicia. Informed of this diversion, Heraclius moved on; but while he appeared to threaten the main body of the Persians under Choreses, he suddenly passed by, left the danger of Armenia to his Caucasian allies, and followed Sarbar through Mesopotamia, either by his track or on a parallel road. They met in Cilicia on the banks of the Sarus, now Suhin, at a moment when Sarbar was in a very critical position, and about to be attacked by the Khassars, who had been driven out of the Caucasus by Heraclius. The Persians were now taken by surprise, and the whole of the Khassars and the Khazar Choreses sent a dispatch to Sarbar, with an order to give up all further designs against Constantinople, and to join him without delay in Persia. The messenger having fallen into the hands of the Romans, Heraclius altered the dispatch, enjoining him to hold out as long as possible, and the letter was forwarded through another courier. Sarbar continued the siege, but Heraclius now despatched a second messenger to the first lieutenant of Sarbar with an order to kill his general as a traitor. This dispatch having been delivered to Sarbar instead of to Choreses, the latter was put to death by a hundred of the principal officers as being all destined to be sacrificed to the anger of their master, whereupon he showed them the order, and declared the only way to save themselves was to break their allegiance to Choreses, and so to make peace with the emperor on their own account. The officers gave
HERBERT, JOHANN FRIEDRICH, a distinguished German philosopher, was born in 1776, at Oldenburg, where his father at the time held an office connected with the administration of the Hanseatic League, and he became acquainted with the philosophical systems of Leibnitz and Kant. Herbert, at the age of about twelve, was led to speculate upon such subjects as God, freedom, and immortality. He then proceeded to study law at the University of Jena, where he studied under Fichte, and formed an intimate acquaintance with him, and he entertained the highest opinion of his master until Schelling's work, 'Von Ich,' fell into his hands. He then abandoned his old views, and formed a new system of philosophy. He had previously been interested in the idea of employing mathematics, and the more clearly Fichte explained his views upon psychology in his 'Sittenebren' (Leipzig and Jena, 1798), the more Herbert became convinced that the speculations of Fichte must be abandoned if any permanent basis was to be gained for his science. About the same time he devoted himself with great zeal to the study of the antient system of philosophy, which led him to form an intimate acquaintance with the systems of Plato and the Eleatics. However he continued his own researches which he had commenced under Fichte, and from 1802 to 1805 he delivered a course of lectures in the University of Göttingen, where he developed his peculiar method of thought, and from which his system subsequently much extended, but remained essentially the same as it had been from the beginning. His tendency was to free metaphysics from all materialistic and mechanical circumstances, and partly to his personal acquaintance with Pestalozzi, that his first works treated on education; in 1809 he was appointed professor of philosophy at Königsberg, and was at the same time entrusted with the superintendence of the higher educational establishments in the eastern parts of Prussia, in the organization of which he did great service. In 1833 he was invited to the chair of philosophy in the University of Göttingen, where he returned (1833) the greatest attention on account of the clearness and precision with which he explained his views. He remained at Göttingen until his death, on the 4th of August, 1841.

Herbert is the founder of a particular system of philosophy, which is interesting on account of his peculiar method rather than his originality of thought, for in reality his system is of a syncretic kind, and Fichte's influence upon it cannot be mistaken. Although Herbert occasionally professed to be a follower of Kant, still he is of opinion that Kant's 'Criticism of Pure Reason' is almost without any objective value, and that its method must be entirely abandoned if metaphysics are to be preserved. The 'realistic tendency further reminds us of the monads of Leibnitz. Philosophy, according to Herbert, has, not, like ordinary sciences, any particular set of subjects which are its province, that it is not affected by any particular subject whatsoever is treated. The subjects themselves are supposed to be known, and are called by him 'notions' (Begriffe), so that philosophy is the methodical treatment and way of thinking, a discourse on accurate definitions. The different methods of treatment constitute the main departments of philosophy. The first of them is logic, which considers the nature and clearness of notions and their combinations. But the contemplation of the world and of ourselves brings before us notions which cause a discord in our thoughts. This circumstance renders it necessary for us to modify or change those notions according to the particular nature of each. By the process of communication or change of intentions, which Herbert calls the supplement or complement (Erganzung). Now the second main department of philosophy is metaphysics, which Herbert defines to be the science of the supplement of what is wanted. The third department consists of the supplementary notions which are necessary in order to render given facts which contain contradictory notions, intelligible, is, according to him, the method of relations, and it is by this method that we eliminate contradictions. The fourth department of Herbert's system is the natural science, which he calls natural philosophy, or Belles Lettres. The map of Asia Minor and part of Persia, in Kimeir's 'Journey through Asia Minor, Armenia and Persia,' was taken from Herbert in his campaigns, but they are not correct. We want a complete critical commentary on the expeditions of Herbert, which would offer less difficulties now than it did to D'Anville, since our knowledge of the country is more exact than it was a hundred years ago.)
HERITAGES.

Heretics. The words "heresy" and "heretics" were used in various contexts throughout history. In the ancient world, heresy referred to beliefs that were not in accordance with the established religious doctrine. This could include variou
which they receive their encomiasts. So far as this, there is certainly no objection. There ought to be some speedy mode of depriving a man of these encomiasts, which he accepts upon certain terms. He who will receive them (Frankland, P.C.B.), and yet peace against the philosophical faculties of Munich, he is said to be paid for teaching, deserves the repudiation of all mankind; and those who dislike ecclesiastical authority most could not be better pleased than to see such an offender banished from the church, and put in any way that the rule of the church provides, to which the offender has solemnly submitted himself.

In the year 1630 proceedings were commenced in the Arcisian Congregacy of the Rev. Mr. Oakley for writing, publishing, and maintaining doctrines contrary to the Articles of Religion.

The history of Hermits in England is instructive. The change from burning alive to the free expression of opinion on religious matters is one of the steps in the social progress of England. For some other matters connected with the subject, see Beza.

HERMES, GEORG, the founder of a philosophical school of Roman Catholic theology, was born on the 22nd of April, 1775, at Dreyerwalde, near Münster in Westphalia, where he received his first education from the priest of the place. He subsequently became a pupil of the gymnasium at Rheinau, and there gave the first proofs, especially in his mathematical lessons, of his strong mental powers. After the year 1795 he entered the theological faculty at Münster, he devoted himself with great zeal to the study of the philosophy of Kant, and thus arrived at the conviction that no one can establish a perfect system of theology unless he has first seriously considered the first principles on which human knowledge is based. In 1796 he was appointed teacher at the gymnasium of Münster, and all his exertions henceforth were directed towards restoring, on a firm basis, that which had been demolished by Kant's 'Criticism of Pure Reason.' As a teacher at the gymnasium, he had no opportunity of making known the results of his philosophical studies. This opportunity however was offered to him in 1801, when he was appointed professor of the gymnasium. His great talent as a lecturer, and his kind and benevolent manners, attracted great numbers of students. On one occasion, when he had to give his opinion on some ecclesiastical question, he greatly offended Droste-Vicherthor, afterwards Archbishop of Cologne, and the ill feeling thus created had probably some influence in the subsequent proceedings against the doctrines and followers of Hermes. In 1819 Hermes was appointed professor of theology in the newly established University of Bonn. His lectures again attracted students not only from all parts of Catholic Germany, but the King of the Netherlands sent a large number of young men to Bonn for the purpose of studying under him. He obtained the esteem of the highest esteem both of his colleagues and pupils, and he died at Bonn on the 26th of May, 1831.

The only work that Hermes published bears the title 'Christology of the Roman Catholic Theology,' Münster, 1819, 8vo.; a second edition appeared in 1831. So long as the Archbishop Spiegel zum Dosenberg was alive, Hermes and his views were not attacked by the see of Rome; but soon after the elevation of Droste-Vicherthor to the archbishopric of Cologne, reports were made to Rome about the infidel tendency of Hermes's work, which still continued to be the chief theological manual at Bonn and other German universities, where the chairs were filled by the disciples of Hermes. There is no doubt that the denunciations against Hermes was in the first instance made by some German who was in communion with him, but it was taken up by Perrone, who made his report to the pope. The objectionable point in Hermes's work was his principle, that reason or philosophy must in the first place prove the reality of a divine Being, and second, the truth of the Roman Catholic system. These points being ascertained, Hermes demanded absolute submission to revelation. He does not attempt philosophically to prove the truth of every particular doctrine in the Bible, but the Church, he says, shall not be bound to publish his dogmas, and to demand submission to them. Hermes thus did not attack a single dogma of the Church, and his orthodoxy can scarcely be disputed; but if we consider that this principle was established, the right of exercising his private judgment, and at the same time remember that the Roman hierarchy had reason to dread every philosophical inquiry into its system, since, although Hermes remained orthodox, it was by no means certain that future theologians might not be led astray by their application of philosophy to theology, it will not be surprising to find that, on the 26th of September, 1835, the pope issued a brief against the work of Hermes. The severity with which this brief was enforced is an illustration of the rigor with which heretical practices produced a rupture between the courts of Berlin and Rome. The discipline of Hermes made all possible efforts to defend their master, and two of them, Professors Braun and Evinchen, went to the pope point out to his holiness that Perrone had misrepresented the views of Hermes. But their exertions were of no avail. The pope, as late as the year 1844, severely censured the Prince-bishop of Breslau for not being zealous enough in preventing the alienation of the disciples of Hermes. In the same year the professors Braun and Achterfeld of Bonn, who refused to recant their Hermeneutics, were forbidden to lecture in the university by order of the archiepiscopal coadjutor, Von Grimmel, at Cologne. The number of pamphlets that have been written for and against Hermes is prodigious, and has probably contributed not a little towards the religious movement now going on among the Roman Catholics of Germany. The best exposition of the whole controversy may be found in Evinchen's "Der Hermesianismus und sein Romischer Gegner Perrone, Breslau, 1844, 8vo."

HERMIT, more properly Eremite, from the Greek eremitein, signifying an inhabitant of a desert, is the name given to one of a particular sect of Christians who, becoming members of any monastic community. The distinction between hermits and monks, and the origin of both, are explained in P.C. under the term Morachismus (xv. 312). See also Dr. Leake, A.D. 16. 1745.

HERMOCYNES, a heretic of the early church, against whom Tertullian has written a treatise, was most probably a native of Africa, and flourished, according to Damase and Le Clair, 2016. 'The information we possess respecting him is contained in Tertullian and Theodoret. It appears from the former of these writers that Hermogenes, though professedly a Christian, had throughout his life evinced a strong admiration of the heathen philosophy, and especially to those of the Stoics. He is accused of having taught that God made the world out of matter that was exterior to himself. The chief design of Tertullian's treatise is to confute that notion; his principal argument against him is, that if matter be eternal, there must necessarily be two Gods, which however Hermogenes did not allow, but expressly asserted the existence of one supreme governor of the universe. The following, in a few words, appears to have been the system of this heretic: he did not introduce any con or any creator different from the one God, the Father; but he asserted the eternity of matter, and that it was created by God as the means whereby he had a confused and turbulent motion, and to it he ascribed all the evils which exist in the creation. It was out of this confused matter that God brought order and perfection. He had, it is believed, in a first act of creation, probably, most of the other great doctrines of religion, as he is not charged by either Tertullian or Theodoret with any other heresy than that to which we have just alluded: he made no account of any of his writings, though it may be inferred from the arguments of his opponents that he was an author. We are ignorant of the year of his death. For a fuller detail of his opinions see Lardner, Hist. of Heretics, ch. xvii.; Tille- mont, Hist. Eccl.; and Cave.

HERNANDIAEÆ, an unnatural order of incomplete Eustomous plants. It has nonocious or hermaphrodite flowers, some parts of which, however, are inserted in the axillary spurs or corymbs. The species are trees, shrubs, and climbers, with alternate leaves, and flowers arranged in axillary sprays or spikes. This order has been constituted by Blume. It contains only two genera, Hernandia and Inocarpus. These are sometimes regarded as a family, but the absence of albumen from their seeds. Their longitudinal anthers distinguish them from the Lauraceae, in which order they have also been placed. Their affinity is undoubtedly with Thymelaeaceae, from which they differ only in their dru-
passecous fruit, lobed cuticle, and the involved to some of the other species of the

Hernandia, the typical genus of this order, was named after Hernandez, a naturalist sent out to Mexico by Philip II. of Spain; and it is said to have been given to these plants, which have large leaves and little flowers, in allusion to the great opportunities afforded to this naturalist and the little use he made of them. The characters of this genus are the same as the order.

Hesperia is a tall erect tree, with coriace leaflets, yellowish yellow flowers, a large insectivorous calyx, with a small roundish entire mouth. It is a native of the various parts of the East and West Indies, and has obtained its place in this order by its beautiful inflorescence through its persistent involucres. The bark, the seed, and the young leaves of this tree are slightly cathartic. Rumphius says that the fibrous roots chewed and applied to wounds produced by the Macassar poison, act as an effectual cure. The juice of the leaves is employed as a depilatory. It destroys the hair wherever it is applied, and this without producing pain. The wood of this species is very heavy, and Asnelt says that the wood of H. Guianensis takes fire readily from a flint and steel, and may be used as tinder. Several species of Hernandia are mildly purgative.

(Lindley, Natural System; Lindley, Flora Medica; Burnett, Outlines of Botany.)

Hesperis (from 'Hesperus,' the evening), a genus of plants belonging to the natural order Cruciferae, and the tribe Brassicaceae. The flowers are opening the night, and hence the genus derives its name. The pods are quadrangular, or sub-compressed, the valves keeled and somewhat swelled, the seeds in a single row. There are only three species of Hesperis, and are either a peculiar use of man but as ornamental and sweet-scented plants.

H. Matronalis, Dame's Violet, is the only British species; it has an erect branched stem, ovate lanceolate leaves, and large handsome flowers. The ladies of Germany have pots of this plant placed in their apartments; hence it has been called Dame's Violet. Parkinson calls it Queen's Gilliflower; and Gerard, Damask Violet.

A violet is a plant in a light soil, and requires the same treatment as most other hardy plants.

(Don, Gardener's Dictionary; Babington, Manual.)

Hexapla, the plural of Hexa, which means 'six fold,' was an edition of the Scriptures of the Old Testament prepared by Origen, which exhibited, in addition to the original Hebrew text, a Greek text, its variants in parallel columns; namely, the Septuagint, that of Aquila, that of Symmachus, that of Theodotion, one found at Jericho, and one found at Nicalopis in Ephesus. It also comprehended a seventh version of the Psalms. The Hebrew text was besides given both in Hebrew and in Greek characters: so that properly speaking there were eight columns in all, whence the work is sometimes called Origen's Octapla. And he also prepared a less extensive work, containing only the versions of the Seventy, of Aquila, of Symmachus, and of Theodotion, which he entitled Tetrapla. Only some fragments of Origen's Hexapla remain, which have been collected and published by Birch, but it is said that the Hexapla known as The Hexapla quae superstant, 2 vols. fol., Paris, 1718. There is also a later edition, which however is held in less estimation, by C. F. Riedel, 2 vols. fol., Leipsic, 1769-70. Before Montfaucon published his edition, which is now of great rarity, many fragments of the Hexapla had been collected by Petrus Marinus Parisius, and inserted by Flaminio Nolius in his Greek Bible printed at Rome in 1587: and all that had then been recovered were given, by Joannes Drausius in his 'Veterum Interpretatione Graecorum Fragmenta,' Arnheim, 1622.

(See P. C. Aquila, ii. 206; Bible, iv. 372; Septuagint, xii. 257; Symmachus, xiii. 445; Theodotion, xii. 326.)

HEYWOOD, JOHN, one of our earliest dramatic writers, lived in the first half of the sixteenth century. He was probably a native of London, and it is said, was a seaman at North Mins, in Berks, where he is supposed to have made the acquaintance of his neighbour Sir Thomas More. This lover of wit introduced him at the court of Henry VIII., and it is said, that his talents were so remarkable by way of satirizing all the singulars, and his livelihood, both in society and in his writings, gained him high favour. To Queen Mary he was further recommended by his zealous attachment to the Church of England. In the reign of Edward VI., he was one of the soldiers plotting against the government, and is said to have with difficulty escaped the halter. He retired to the continent, and died about 1565, at Mechlin, in Brabant. Heywood's drama and satirical pieces stand in a distinct section. They are divided into two distinct sections. They may properly and strictly, says Mr. Collier, in his 'History of Dramatic Poetry,' be called Interludes—a spe.
cules of writing of which he has a claim to be considered the inventor. The earliest of them, 'A Merry Play between the Pardoner and the Friar, the Curate and Neyerbhr Prate,' was written in 1383, but must have been written before 1291. In Dodgson's Old Plays will be found his 'Play called the Poure F. P., a new and a very merry Enterlude of a Palmer, a Pardoner, a Pottery, a Pedlar,' which is a fair specimen of the fantastic arrangement of the grotesque and coarseness of his humour. Among the other productions bearing his name was a posthumous volume of 'Woorkes,' 1578, 4to., which contains proverbs in verse, and six hundred woodcut illustrations in which his own time he was probably better known. In respect of them, and to distinguish him from a later play-writer [Hewwood, Thomas, P. C.], he is not infrequently called 'The Epigrammatist.'

The CRACH'T, a genus of plants belonging to the natural order Composite. The heads are many-flowered, the involucre imbriicated with many oblong scales. Fruit terete, crogular, and furred, with a very short crenulated margin. There are nineteen British species of this genus, but none of them are valuable on account of the properties they possess.

H. pilosella has a leafless single-stemmed head; elliptic-lanceolate or lanceolate leaves, hairy above, glabrous beneath. The flowers are of a pale lemon colour with a red stripe on the back. It is found on dry banks and elevated places.

H. alpium has lanceolate leaves narrowed into a footstalk, entire or toothed; the involucre is covered with long silky hairs externally and with a white, smooth, bright yellow colour. It is found on rocks in Great Britain.

(Huntington, Manual of British Botany.)

IIEROCLOE, a genus of grasses belonging to the Phlaeantidae family. There are seven species, nearly equal, superficially similar, and of a bright green colour, about as long as the flowers; three flowers, the lower with three stamens, the upper palea with two keels, the upper flowers with both stamens and pistils, the stamens two, the upper palea with a keel. One species of the genus has been found in Great Britain: it has an erect panicle, glabrous pedicels, and flowers without awns. The stem is about a foot high. It has only been found in Scotland.

(Huntington, Manual of British Botany.)

HIGH COMMISSION COURT, a tribunal established by Queen Elizabeth under the authority of a clause in the Supremacy Act (1 Eliz. c. 1), which exercised arbitrary power in matters of faith and in ecclesiastical concerns as the Star Chamber did in civil affairs. The commissioners were forty-four in number, of whom twelve were ecclesiastics, and three commissioners constituted a quorum. Their jurisdiction extended over the whole of the kingdom, and included all classes. They were directed to visit, reform, redress, order, correct, and amend all errors, heresies, schisms, abuses, offences, contumacies, and enormities whatsoever in the church under any ecclesiastical authority whatever which might be lawfully ordered or corrected. The commissioners, or any three of them, judged at their own discretion of any speech or writing which tended to heresy or schism. All appeals from their decisions were made before the Court of High Commission. The court was empowered to punish incests, adulteries, fornications, and any crime or corrupt practice in matters of matrimony. Other ecclesiastical courts had been subject since the Reformation to prohibitions from the supreme courts of law, but this court was exempt. It exercised its powers therefore without control, and was authorised to conduct its proceedings, not only by the ordinary laws of justice, by witnesses, and to use 'all other means and ways which they could devise.' This empowered them to resort to the rack, to torture, inquisition, and inquisito to proceed, not only to the excommunication, but at their own discretion upon rumour and suspicion. The court could bring before it a suspected person, and by administering to him an oath, compel him to answer any question, and especially to swear that he himself or his father by this oath was punishable by imprisonment. Fines were levied which often ruined the offender, and he might be imprisoned for any length of time at the discretion of the court. The greatest rigour of the court was especially to punish any departure from the Act of Uniformity in matters of religion or in the services and ceremonies of the Established Church. Elizabeth, in a letter to the Archbishop of Canterbury, said that he was required by the Three Estates to refrain from any measure which would be contrived to undermine any man should they be suffered to decline, either on the left hand or on the right hand, from the drawn line limited by authority and by her laws and injunctions. The Commons remonstrated strongly against the tyranny of the Court of High Commission, and by way of answer she granted towards the close of her reign a new patent in which the powers of the court were in some respects extended.

In the reign of James I., the sentences of the Court of High Commission were most generally confined to deprivation; but when the Commons remonstrated on account of its proceedings he refused to interfere. In 1610, by virtue of the royal prerogative it exercised full and unlimited authority over the Church of England, and with the full powers of the former courts. Sancroft, archbishop of Canterbury, refused to be a member. Four of the commissioners were bishops, and the three laymen were the Earl of Rochester, Chancellor Jeffries, and Lord Chief Justice Herbert. The Revolution swept away this arbitrary institution.

HIGH CONSTABLE. [Constable, P. C., p. 466.]

HIGH STEWARD. [Steward, Lord High, P. C.]

HIGH TREASON. [Treasos, P. C. ; Law, Criminal, P. C. S.]

HIGHMORE, JOSEPH, a portrait- and historical painter of some eminence in his day, was born in London in 1592. He was the nephew of Higmore, Serjeant-painter to William III., and was originally bred to the law, but having a decided disposition for painting, he gave up the law and became a pupil of Simon Vouet. He was the first English painter at Lincoln's Inn Fields, where he painted a set of portraits of the Knights of the order of the Bath, which has been engraved by John Faber the Elder. He was a man of general information; he had a good knowledge of anatomy and was thoroughly acquainted with perspective. He used to attend Cheeselden's lectures, and he made the drawings for his treatise on perspective; we owe to his pen practical books on perspective: - 'The Practice of Perspective, on the principles of Dr. Brook Taylor'; in a series of Examples, from the most simple and easy to the most complicated and difficult cases, London, 1783. He published also a critical examination of the ceiling painted by Rubens, in the Banqueting-House at Whitehall; it represents the apotheosis of James I. Highmore painted many portraits of royalty, nobility, and gentry, one of the best of which is that of Young, the poet, at all Sou's College, Oxford. His historical pieces are of only average merit: one of the best, Hagar and Ishmael, was presented by him to the Foundling Hospital; there it is in the same institution a portrait of Mr. Emerson by him. He painted several pictures from the works of Richardson the novelist, but his chief work was taken from the first part of Dryden's 'King Arthur' in 1679, in the house of his daughter, who was married to one of the prebendaries of that city, and he was buried in the cathedral.

(Gentleman's Magazine, April, 1780.)

HIGHTEA, a genus of ferns native to the Atlas of Sheppey. [Bowerbank.]

HILLARD, NICHOLAS, limner, jeweller, and goldsmith to Queen Elizabeth and to James I., was born at Exeter in 1547; his father, Richard Hilliard, was high sheriff of Exeter and Devonshire in 1560. Hilliard, a jeweller by education, acquired painting by studying the works of Holbein and Honthorst, and became celebrity as a miniature painter. Dr. Donne, in a poem on a storm in which the 'Earl of Essex was surprised, returning from the island voyage, says—

By Hilliard drawn, to worth a history
By a worse painter made.

There are many miniatures, especially of ladies, by Hilliard extant. He painted Mary, Queen of Scots, Elizabeth several times, James I., and Prince Henry. He had for twelve years the exclusive privilege of painting and engraving the portraits of James I. and the royal family. Charles I. possessed several by Hilliard, but it was thought to be a man should they be suffered to decline, either on the left hand or on the right hand, from the drawn line limited by authority and by her laws and injunctions. The Commons remonstrated strongly against the tyranny of the Court of High Commission, and by
HIC

HIL

HINCMAR was born in France in 866. He was of a noble family, and nearly related to Bernard, Count of Lou- uson. At a very early age he was placed under the care of Hilduin, abbot of Soissons, who had acquired a high reputation for learning and strict observation of monastic discipline. His talents and high birth brought him under the notice of the Emperor Lewis the Meek, at whose court he frequently attended. In 848, having fallen under the displeasure of his royal master, he was banished from the court, and retired to Saxony, whither he was accompanied by Hincmar. On the death of Hilduin, his successor Lewis, an illegitimate grandson of Charles the Bald, again introduced him to the court of the emperor, who presented him with the government of the abbeys of Notre Dame at Compiegne and St. Omeron. On this occasion he excelled his respect for the observance of the canon law, which at that period was often set aside, in requesting the sanction of the bishop of the diocese, and that of his own abbot, previous to accepting that prebend. In the year 943 was assembled the first council of Beauvais, consisting of ten bishops of the provinces of Rheims and Sens. In that council the deposition of Ebbonius, archbishop of Rheims, was confirmed, and Hincmar was elected by the clergy and people to succeed him. In the year 956, at the session of the Synod of Sois- sons, eight articles of convention between the emperor and Hincmar were drawn up, defining the extent of their separate jurisdictions in matters ecclesiastical; and the following year a synod at Sens, of which the powers of the metropolitan bishops were more clearly defined and extended.

About this period Godesclauclus, a native of Germany, and monk of Orbais in France, attracted popular notice by a new exposition of the doctrines of St. Augustine on predestination. His peculiar views on this abstruse subject were promptly brought forward during a pilgrimage which he made to Rome, and drew upon him the displeasure of the principal theologians of the day. A council was convened at Mayence by Raban Maurus, archbishop of that city, in which the opinions of Godesclauclus were combated and condemned, the arguments against him being chiefly deduced from the writings of St. Au- gustine himself. It was then resolved to transmit his text, and to leave the judgment to be pronounced upon him by Hincmar, in whose province was situated the monastery of Orbais. The peculiar opinions of this impudent monk, magnified by the hostile interpretation of them which Raban Maurus gave, caused him to be attacked from all sides. Men, beginning from the emperor, were in turn directed against him. From one who had already begun to rule the church in an iron hand. Hincmar caused him to be accused before thirteen bishops at the council of Quierzy, where he was declared an incorrigible heretic and deposed from the episcopal dignity, and into which it appears, he had been irregularly admitted.

This punishment, however, was not sufficient to appease the rancor of his judges; the bold enunciation of his tenets was construed into sedition, and, as such, punishable, according to the rule of St. Benedict, by corporal chastisement. He was condemned to a public flagellation, and to commit his writings to the flames, which sentence was executed with all the cruelty so characteristic of that barbarous period. He was afterwards confined in the monastery of Hautvilliers, where, twenty years afterwards, he ended his miserable existence.

In the year 820 Hincmar embellished and enlarged the church of St. Remi, and reformed the chapter, and caused a magnificent vault to be constructed, in which he deposited the relics of its patron saint. The following year he assisted at the council of Soissons, in which all the ministerial acts of his predecessor Ebbonius were declared void; the donation of Sens was confirmed, and the claim of that diocese alone excepted. In 827 he composed his first great work on Predestination, the preface of which is the only part extant; in it he examines the subject of Hincmar. In the mean time he continued the work of the new cathedral; he was accused of having fallen into the opposite error of semi-Pelagianism. About this time also he wrote several letters to Charles the Bald, in which he complains of the misfortunes of the churches and monasteries, and endeavors to intimate that the depredators were emboldened, if not by the countenance of the king, at least by the knowledge that the offenders would go unpunished. These letters present a singularly interesting picture of the state of matters at that age. A few years later he wrote a second treatise on the

(Anon. Union, 1840; Catalogues of the Exhibitions of the Real Academy.)

In 1814 he exhibited Miranda and Ferdinand bearing a Log; and he was elected an Associate of the Academy in the same year. He was elected a member in 1820, when he exhibited his picture of Ganyande, which he presented to the Academy as his diploma piece. In 1825 he exhibited his Christ crowned with Thorns. Two years afterwards he succeeded Fuseli as keeper of the Academy, a post which he held until his death on the 30th of December, 1835, in his fifty-sixth year.

Hilton died in possession of his best pictures—The Angel releasing St. Peter from Prison; Serena rescued by Sir G. C. Northcote; the Meeting of the Sun and the Moon, exhibited in 1838, the last work exhibited by Hilton in Amphi- trite; Una with the Lion entering Coreca's cave; and Rizaph watching the dead bodies of Saul's Sons (unfinished). Sir Calpine rescuing Serena, exhibited in 1831, was pur- chased by subscription from Hilton's executors, for 500 guineas, and was presented to the National Gallery, where it now hangs, and it is one of the most attractive English pictures in the collection, though far from being the best of Hilton's works. Una entering the cave of Coreca, exhibited in 1832, was purchased by R. Ellson, Esq., and was engraved by W. H. Watt for the Art Union of London, and distributed among the subscribers of 1840. The St. Peter delivered out of Prison by the Angel, of which the figures are of the size of life, also exhibited in 1831, was purchased by William Bishop of Plymouth. Mr. Robert Vernon, who possesses the best collection of recent English paintings extant, has two capital works by Hilton—Rebecca with Abrahams servant at the Well, exhibited in 1829; and Edith and the Monk searching for the body of Harold, exhibited in 1834. The following also are of the same school—The Monk in the garden, exhibited in 1828, and in the collection of the Very Rev. Dr. Hume, in Lichfield; the collection of Mr. John Swinburne, Bart.; Jacob parting from Benjamin, in the possession of W. Wells, Esq.; the Graces teaching Cupid to play on the Lyre, the property of Sir J. J. Bartholomew, Bart., in the collection of Mr. Charles Westmacott, Esq.; the Angel and the Lily, in the collection of the Very Rev. Dr. Swinburne; the Group from the Quirin, belonging to W. Smith, Esq.; Cupid and a Nymph, the property of J. R. Turner, Esq.; The Rape of Europa, painted for the late Earl of Egremont, of which there is a print by Charles Westmacott, which is exhibited.

The greater part of the above-mentioned works were exhibited with the works of old masters at the British Institution in 1840. Hilton must ever rank very high among the painters of his own country, up to his own days, but his glory will dimly hhh

as the sphere of comparison is extended. He was not a great painter; his energy was not extraordinary, nor was his invention exuberant, but his colouring is harmonious and rich, and his technique and design were refined and ample. The figure of Sir Calpine, in the National Gallery, is not a very good specimen of his style; it is exaggeraded, and is not upon its feet. This is a peculiarity which occurs more than once in Hilton's works; his figures want the specific gravity. Those who knew him describe him as a man of much intelligence and great amiability. His manners were pleasant and dignified and his voice was low; and his demeanour peculiarly quiet; like all men of genius he was modest, retiring, and unassuming. He died a widower, and childless.
subject of Predestination, which has been preserved. The arguments in it are chiefly directed against the opinions of the learned John Scotus Erigena, whom he accuses of error respecting the nature of the Trinity in the eucharist. Among other curious accusations brought against Scotus, he charges him with believing that the soul of man is not lodged in the body, and that the portion of matter consigned in resumption of conscience caused by the remoteness of sins.

In the year 862 we find Hincmar engaged in controversy with the pope, Nicholas I., one of the most learned ecclesiastics of the time. The occasion of the dispute was as follows: Rotharius, bishop of Soissons, had incurred the displeasure of his metropolitan, Hincmar, on account of the deposition of a priest of his church, whom Hincmar wished to restore to office. Rotharius, dreading the consequences of his act, was condemned in two councils held at Soissons, excommunicated, and afterwards deposed and imprisoned. On an appeal of Rotharius to Rome, the pope issued a peremptory order to Hincmar to restore this bishop to his see within thirty days, or to appear at Rome, either in person or by legate, to answer the charge which had been made against him. In the year following, Hincmar commissioned Odo, bishop of Beauvais, to proceed to Rome, and to request a confirmation of the decrees of the council of Soissons. Nicholas, irritated at the opposition of Hincmar, rescinded the decisions of that council, and declared that the liberation of Rotharius, in order that he might plead in his defense at Rome the validity of his appeal. This demand was first resisted by Hincmar, but, through the interference of the king, Rotharius was released, and deposed. The liberation of Rotharius, and the pope to state the reasons of his conduct. This triumph of Nicholas was soon succeeded by one more important; Rotharius was restored to the episcopal dignity, and he returned to his diocese accompanied by a legate of the pope. The pretensions of Rome in this affair were founded on 'The Decretals of the Ancient Pontiffs,' a work probably composed by Sisdat Mercurius, but claiming much greater antiquity. Hincmar, though the most learned canonist of the age, does not appear to have doubted the authenticity of these Decretals.

The interference of the Pope in temporal matters was however more successfully resisted. On the death of Lothaire, king of Lorraine, Adrian II. was desirous of excluding Charles the Bald from the succession of his states, and to bestow them upon the Emperor Lewis. To this effect he addressed two letters, one to the nobles of Lorraine, and the other to the subjects of Charles, threatening excommunication should they disobey his injunctions to favor the cause of Lewis. Hincmar, in the name of his fellow subjects, replied to the pretensions of the Pope. In his letter he remarks that Adrian, on a notion that he is the king and bishop, and that his predecessors had regulated the church, which was their concern, not the state, which is the heritage of kings. The opposition was successful, and Charles was enabled to retain possession of the throne of Lorraine, of which all the subsequent efforts of the disappointed pontiff were unable to deprive him.

In the year 871 Hincmar presided at the Council of Douai, composed of twenty bishops assembled by the order of Charles the Bald, for the purpose of inquiring into the conduct of Hincmar, bishop of Laon, nephew of the archbishop of Rheims. He was accused of spoliation of church revenues, of usurpation of powers not properly belonging to a bishop [INTERDICT, P.C.], and of revolt against his sovereign. His uncle appears to have conducted the trial with severe impartiality, on condition, sentenced him to be degraded from his ecclesiastical office.

About ten years after these events Hincmar exercised the same firmness in defending the rights of the church against the encroachments of the secular power. A claim, it is to be shown in opposing the claims of the Roman pontiff. Lewis II. wished to bestow the bishopric of Beauvais upon Odacer, a favorite courtier, who had been rejected as unworthy of the office by the Council of Vienne, and he exerted, both by supplication and menace, to obtain the acquiescence of Hincmar to his nomination. This prelate, however, boldly defended the liberty of canonical elections, and the independence of the church. The metropolitan, Lewis, was so nearly removed from him by the sanctity of the oath he had taken to respect the privilege which the church possesses to refuse induction to unworthy candidates, and warns him against arrogating to himself a power which had been denied to the most eminent of his predecessors. 'I trust,' he observes in it, 'ever to preserve inviolate my fidelity and devotedness to your service, indeed I have not a little contributed to your own election; I return the favor, it is true, and I do not grieve any body; but this case made me in my old age to depart from the holy rules of the church, which, thanks be rendered to God, have ever been my pride during six and thirty years of my episcopacy.' (Hincmar, p. 188.) He proceeded to assemble a council, in order that his nomination may be ratified by the clergy and people of Beauvais. In a second letter he uses still stronger language, and terminates it with these ominous words: 'In the name of the Father, and of the Son, and of the Holy Ghost, be this act of grace and love which I have performed, not on the earth, but the church with its pastors, under J.C.'s chief, has, according to his promise, an eternal existence.'—'This threat,' says Fleury, 'appeared a prophecy, when the king, years afterward, in a fit of passion, had his son, the king's, youth, died the following year.' (Fleury, b. iii. c. 31.)

Hincmar did not however long survive his royal master; about this period the Normans extended their predatory incursions as far as his province, the principal towns of which they pillaged and destroyed. They were advancing towards Rheims, when notice of their approach was given to Hincmar, who was obliging enough to leave the city by night, having previously taken the precaution to secure the treasures of the church, and the relics of St. Remi. The aged prelate arrived at Epenau, worn down by fatigue and anxiety. Severe illness compelled him to seek a place of rest, and on the 12th of December 882 he ended his eventful life. The name of Hincmar, though associated with the darkest period of ecclesiastical history, will ever be conspicuous as that of one of the most zealous defenders of church liberty and Rome. He was the great object to produce that unity among its members which could alone present an effectual barrier against the encroachments of regal and papal authority. The memorable words which he uttered when he heard that the Pope was about to visit France, and threatened the excommunication of his bishops, are a sufficient index of his fearless spirit. 'Si excommunicatur venit, excommunicatus abit,' if he comes to excommunicate, he will return excommunicated.'

The principal works not alluded to in this article, are 1st, 'A Treatise on the Duties of a King,' addressed to Charles the Bald. 2nd, 'On the Ordal by Water,' which practice he attempts to authorize by quotations from Scripture, and which unfortunately proves that he was not superior to the superstitiousness of the age. 3rd, 'On the Rights of Metropolitan Bishops.' 4th, 'On the Translation of Bishops and on their Duties.' 5th, 'On the Council of Nices.' 6th, 'On the Nature and Sanctity of Oaths.' besides several letters and 'Capitularia.' His works have been collected in two volumes folio by the learned Sirmond, Paris, 1645, and another volume was published at the same time.

The following are the principal authorities which have been consulted, and may be referred to for a fuller detail of his life. Fleury, Mabusem, and Waddington's Eccles. Histoire des Popes, vol. ii.; Mem. des Sav. de l'Acad. des Inscriptions, tom. ii.; Mabusem, Hist. de France, tom. ii.; Mabusem, Hist. de France, l. ii. c. 3; and Guizot's Sixth Lecture on Modern Civilization.

HINDOEO ARCHITECTURE. (Heronius, P. C., p. 235.)

HINGE, a kind of joint, usually made of iron or brass, upon which doors, gates, shutters, box-covers, &c., are made to turn in the act of opening and shutting. Hinges are constructed in a great variety of forms; but in most of the common kinds the action is that of a hollow cylinder working round a fixed central pin. Without pretending to describe the varieties so familiar to every one, we may be content with a few of the more important deviations from the ordinary form, referring to Heber's 'Engineer's and Mechanic's Encyclopedia' for fuller details. In Collinge's patent hinges, which are made of wrought iron, no peepholes are provided for the vision of the person using the gate; the principal rubbing action is between a hollow cap and an accurately turned sphere, formed, as it were, upon the end of the pin; a cavity being provided for the reception of a supply of oil to prevent the formation of rust. A somewhat similar hinge, another celebrated manufacturer, who has displayed his ingenuity especially in designing hinges for unusual and apparently impracticable situations, in rendering them much lighter in weight than usual, in such a manner that they would be a disengagement, and for contriving invisible hinges for situations in which it is desirable to conceal the hinges altogether, is the inventor of the rising hinges so frequently used for hanging room-doors in houses of superior character.
In ordinary door-hinges the hollow cylinder which works round the axis or central pin is divided transversely into three, or more portions: one or more of such portions being attached to and forming part of that leaf or half of the hinge which has become accustomed to being drinking water. A portion of this form part of that half of the hinge which is screwed to the door-post. In the rising hinges a similar arrangement is followed; but instead of the hollow cylinders being divided transversely at right angles, they are divided by spiral or rather helical lines. The result of this contrivance is, that when the door is opened it is lifted up from a little below the floor by the sliding upon one another of the inclined helical surfaces, so that the lower edge of the door may lie very close to the floor, it rises, when opened, to a sufficient height above the floor to allow its lower edge to clear the carpet. Another advantage of this kind of hinge is, that the weight of the door acting upon the inclined rubbing surfaces of the hinges, causes it gently to close itself so soon as the hand is removed from it; but as this might in some cases prove inconvenient, it is usual to cut a portion of the helical curves away, so as to form two horizontal planes which come opposite to each other when the door is opened to about an angle of 90°, or so as to form a right angle with its position when closed. By this arrangement the door retains its disposition to close whenever it is not opened more than 60° or 60°, which is as much movement as is usual upon a person entering or leaving the room, but will stand open if opened to or beyond this angle. In the lower part of the hinge, a sufficient friction to cause it to close steadily and quietly. In some cases a small spring is attached to hinges of this description, to aid in the closing of the door when it has been opened but a little way. Hinges of this kind are not only used for doors of buildings, but are also used for the doors of public offices, where it is desired to render the closing of the door both certain and quick. For such doors, hinges which will open in either direction and cause the door to spring back to its original position are often used. In connection with such spring hinges, we may notice Hebert's contrivance of a hinge for external shutters, in which a spring catch or detent is employed to hold the shutter open, that of the door being needful to release the catch before the shutter can be closed.

One of the most curious contrivances of the hinge kind is that which Hebert describes as Whitechurch's patent hinge, the details of which are so complicated to be explained without several illustrations. We can only state that it is an apparatus by which doors or windows may be opened at pleasure either on the right or left hand, or by which, in other words, either edge of the door may be made, at pleasure, the opening edge. A handle is fixed near to each side of the door or window, by turning which the required portion of the door or window is caused to open. This handle being to disconnect or release the door from the style or post near to which it is placed, and at the same moment to complete its hinge-like connection with the opposite side. The door, therefore, in opening, is only turned for a short distance, the door is stated to be even more securely hung and better supported, and capable of turning upon its hinges with greater facility than one hung in the common way; and it cannot be turned in the wrong direction. For these reasons, the inventor (Dr. Le theatre) claims for his invention a very great advantage. Such a mode of hanging doors is recommended for cabins in ships and steam-vessels, and for other situations in which space is very limited and great convenience is required.

Another contrivance for the safety of notices, which is also described and represented by Hebert, is Nettlefold's hinge for the doors of book-cases, by which two adjacent doors opening in contrary directions may be hung without an intervening stop; the two doors being divided together, the hinges resembling that by which ordinary doors are hung, and the axis of this hinge being connected with the edge of a thin partition in the book-case by metal brackets above and below the hinge, the space occupied by which is notched or cut out of the edges of the doors. Doors hung in this way fold completely back, and the hinges do not offer the slightest impediment to the removal of the whole book-case. The hinges are to stand next to the partition, and which, were the doors hung in the usual way, could only be removed by first taking out those which stand adjacent to them.

Hippo ("Hyppo"), a Greek philosopher, who is called by some the father of Cynicism and a follower of Pythagoras, and by others a native of Rhgium, in southern Italy. With regard to his age, some writers have made him a contemporary of Thales, who was even before the age of Thales; but he evidently belongs to a much later time, and was per-

P. C. S., No. 50.

HIPP has a contemporary of the comic poet Cratinus (about n. c.

450), who ridiculed him in one of his last comedies; further, HIPP mentions the four elements of the physical philosophy of Empedocles in such a manner that we must infer that he is acquainted with Empedocles' treatise "De Quattuor Elementis" (Metaphys. i. 3) does not appear to attach any great value to the philosophical system of Hippo, which in fact was that of Thales, with sundry additions and modifications. He thus appears to have been acquainted with Empedocles' doctrines, which, however, owing to its insignificance, appears to have fallen into oblivion at a very early period, and scarcely any fragments of it have come down to us. Clemens of Alexandria (Cohort. ad Gent. vol. i. p. 48, ed. Potter) has preserved an epigram of Hippo, which is also printed in the editions of the Greek Anthology. (Lamblichus, De vita Pythag. 36; Sextus Empir. Pyrrhon. Hyp. iii. 90, ad loc. Mathen, ii. 301; Schol. ad Aristoph. Nub. 97; compare the Antiqu. Geschicht. der Griech. Römischen Philosoph. vol. i. p. 121, &c.; Bakhuisen van den Brink, Varia Lectioea in Historia Philosophiae Antiquae. 36-50. HIPPODROMAS (from ἱππόδρομος, a horse, and ἡπόδρομος, food), a genus of plants belonging to the natural order Labiaceae. It has the limb of the calyx 5-parted with linear segments; the corolla is 5-lobed, the segments nearly equal; the stamens-tube projecting, completely monadelphous and synangyous; the stigma simple, the capsule 2-celled, 2-valved, many-seeded. H. longiflora, only a species is there. It is an herbaceous plant, with short axillary pedicels, mucronate or coarsely toothed leaves, with long slender white flowers. It is a native of Jamaica, St. Domingo, Cuba, and Martinique, in damp places and by the side of streams. This is one of the most beautiful of plants. If the juice only accidentally touches the lips or eyes it produces a burning inflammation. Horses are violently purged after eating it. (Don. Gardner's Dictionary; Lindley, Flora Medica.) HIPPOCREPIS (from ἱπποκρέπης, a horse, and σφυρήρης, a shoe, on account of the curved shape of its pods), a genus of plants belonging to the natural order Leguminosae, the tribe Hedysarum. It has dissepiments, stamens, a pelliform stipe style; the legume curved, with numerous 1-seeded joints; the seeds cylindrical or compressed, oblong, curved, fixed to the middle part of the joint and therefore the umbilicus is in the middle of the curve. The species are herbs, or under-shrubs, with unequally pinnate leaves and yellow flowers, which are sometimes solitary and axillary, sometimes sessile, but usually disposed in umbels on the tips of the stems. H. balcanica, Minorca Horse-shoe Vetch, is a shrubby erect plant, with the peduncles longer than the leaves, bearing an umbel of flowers at the apex, the legumes glabrous, a little arched. It is a native of the island of Minorca. It is a pretty plant, worthy of cultivation, but requires the greenhouse in winter. It grows well in a soil composed of loam and peat; and cuttings strike readily under a hand-glass. H. comosa, one of both of the previous species, end is a very showy plant, with peduncles umbelate, their joints round, curved, neither dilated nor bordered, glabrous; the peduncles longer than the leaves. It is a native of Europe, and is found on dry chalky banks in Great Britain. It is also found in the north of Africa.

There are seven or eight more species of Horse-shoe Vetch. They are all worth cultivation on account of their beauty. The perennial species are adapted for rockwork and banks, and may be propagated by dividing the roots. The annual species should be grown from seeds, which may be sown early in spring.

(Don. Gardner's Dictionary; Babington, Manual of Brit. Foray.) HIPPOPHÆA, a genus of plants belonging to the natural order Eleagnaceae. It has dicotyledons with oval scaly bracts. The staminal flowers have a perianth of two leaves adhering by the margin; the stamens have four very short filaments; the pistilliferous flowers have the perigone tubular and cloven at the summit; the style is short, the stigma elongated; the nut 1-seeded, clothed with the large colored berry-like perigone. The only species of this genus is the H. rhomboideus, which is a small shrub found on the east and south-east coast of Great Britain, and other parts of Europe, and in Asia Minor. The berries yielded by this plant are often eaten as a salad both in this

VOL. III.-F
country and in France. This plant also yields a colouring
matter, which is used for dying yelloe. Although in this
country the berries are innocuous, they seem to exert a dele-
terious influence, or are supposed to do so, in some of the
eastern counties. From the slope of the sea, the Gulf of Bothnia, the
fishing people of this sea have a very pleasant pastime, as it is
favourable to their occupation, and the fishermen of the
Gulf of Bothnia eat them with their fish.

(Dalby, Manual of Brit. Bot.; Burnett, Outlines of Botany.)

HIPPURIS (from Ipes, a horse, and a., tall, from the
resemblance of the stem to a horse’s tail), a genus of
plants belonging to the natural order Holarceae. It has the
calyx, a large, box-like, bulbous calyx-stem; a filiform style lying in a chamber of the anther; the stigma simple, acute; the fruit mucunamentaceous, one-celled. These
species of this genus have been described. Of these, H. vulgaris, the common mare’s-tail, is found abundantly
throughout Europe and North America. It has linear leaves, 6–12 in a whorl, and callous at the point. It is found in
ditches and lakes. In deep water the submerged leaves are
fractured and pulped, and not callous at the points. This
plant is very common in Great Britain in stagnant waters and
slow streams.

(Dalby, Manual of British Botany.)

HIRCIC ACID. This substance was obtained by Chev-
neul from the fat of the goat.

To prepare it, the aqueous product of the distillation of the
liquid separated from the soap made from the fat, is saturated
with barytes. After having evaporated the solution, the dry
salt is decomposed by dilute sulphuric acid; the hircic acid
then floats on the surface of the liquid in the form of an oil.
In dried form it is lighter than water, smells of the goat, is insoluble in water, and forms soluble
salts with potash and barytes. It has not been analysed.

HIRING OF SERVANTS. (Servant, F. C.)

HOLT, Aloysius, was born at Hola near Doonash-
chingen in Baden, June 27, 1859. In early life he visited
Italy and studied the remains of classic art there, and on
his return settled at Berlin, having been appointed preceptor
to Prince Henry of Prussia. In 1869 he became professor of
architecture and the fine arts at the academy of Berlin,
and was subsequently made professor of archaeology at the
University of Berlin. Among his numerous publications are
several special discussions on particular structures, such as the Temple of Solomon, the Temple of Diana at
Ephesus, and the Pyramids of Egypt; but those by which
he will be most generally and longest known are his Bau-
3to., with a folio atlas of plates. This last not only gives a
history of ancient architecture, that of Egypt included, down
to the close of the Christian empire, but also a full account of all the
various classes of buildings. Latterly he was much occupied
in arranging the collections in the Berlin Museum, which
brought him into a literary dispute with his former pupil and
present college director, whose dissertation he afterwards
published in the form of a book. He was a indefatigable
student and remarkable on English art. Hirt died at Berlin June 29,
1837, just two days after entering his seventy-eighth year.

HODADLEY, Benjamin, M.D., eldest son of Bishop
Hoadley (Hoadley, Benjamin, F.C.), was born February
10, 1705, in London. He was educated at Corpus Christi
College, Cambridge, April 8, 1722, and received his degree of
M.D. in 1728. In June, 1742, he was appointed physi-
cian to his Majesty’s household, and in January, 1746, was
appointed physician to the household of Frederick, Prince
of Wales, and he held both offices at the same time. He was the
Lecturer on the Organs of the Respiration, and read at the Royal College of Physicians in London, 1757,
being the Gulstonian Lectures for that year; ‘Oratio Anni-
saria in Theatro Col. Medico, ex Harvei instituted, habitat
die 12 Oct. 1742.’ ‘Observations on a Series of Elec-
trical Experiments,’ 1756, 4to. Dr Hoadley is now known
chiefly as the author of ‘The Suspicious Husband,’ 1747, a
breezy comedy, full of incidents of intrigue, in which Gar-
field, the gentleman farmer, is punished for his performance of the
character of Ranger, as Elliott was also in more recent times. Dr. Hoadley
died August 10, 1757, in his house at Chelsea. His brother,
the Rev. John Hoadley, LL.D., born October 8, 1711,
died May 31, 1784, was the bishop of Lichfield, was the
author of several poems in Dodsley’s Collection, and of five
drastic pieces, which are now forgotten. He published
an edition of Bishop Hoadley’s Works, London, 1773,
3 vols. folio

HOANG-HAI, or WHANG-HAI. The Yellow Sea, is
a large Mediterranean sea, which runs into the eastern
coast of Asia, being enclosed on the west and north by China Proper,
and on the east by the Peninsula of Corea; on the south it
is divided by the channel of Tsing-tao, and on the north it
is separated from the Yellow Sea of Corea by the strait of the
Straits of Japan, which is the southern entrance to the Yellow
Sea. It is separated from the Sea of Japan by the islands of
coreana, and its eastern boundaries are the coast of Japan and
the Kurile group of islands. The sea is about 760 miles long,
and about 200 miles wide. It is bounded on the north by the
coast of Corea, and on the south by the coast of China. It
is divided into two parts by the channel of Tsing-tao, which
is about 120 miles wide. The sea is shallow, and its
water is clear and of a yellowish tint. The climate is mild,
and the winter season is short. The sea is navigable for
small vessels, and its fisheries are abundant. The

(Hadow, Manual of Brit. Bot.; Doutte, Outlines of Botany.)

The Gulf of Bothnia extends in length from west to east
somewhat more than eight hundred miles from the shores of
the Gulf of Petchel, near the mouth of the river Peho, to
the coast of Corea, at the back of James Hall’s Island;
and it is divided into two branches by a narrow promontory,
middle by a widely projecting peninsula, which juts out
on the northern coast, and may be called the Peninsula of
Leso-tea, as it forms a part of the province of that name.
The strait which lies between the most southern point of this
peninsula and the northern shores of the Province of Shan-
tong is about fifty miles wide, and it contains numerous
small rocky islands, so that it would appear that at some remote
period the Peninsula of Leseo-tea was united to that of Shan-
tong. Between these islands are passages which lead to
the most western basin, which consists of two gulfs, that of
Petchel and that of Leseo-tea.

The Gulf of Petchel washes the north-western shores of
Shan-tang and the eastern part of Petchel. These shores
are low, and can only be seen from the deck of a vessel at
the close of the day, and the distance the shore is visible
from the sea along those shores is unusual. At the distance of
ten miles from the beach they vary only between four and a half
and six fathoms, and at twelve miles between six and eight
fathoms. These shores are sandy, and the fisherman’s boat
that remain at anchor from four to six miles off. This part of
the Huang-hai is only navigated by flat-bottomed vessels, which
find shelter in the embouchures of some small rivers. Where
the gulf approaches the above-mentioned strait between
Leseo-tea and Shan-tang, the shores rise higher, and are well
defined. Here a range of mountains stretches from south-
west to north-east at the distance of ten or twelve miles from
the sea, and beyond which the shore is a lower belt of
elevated ground in a state of high cultivation, covered with
many towns and villages, and interspersed with scattered trees
and several extensive woods. Along this coast the soundings
are somewhat deeper than on the other, but not so deep as
might be expected from the bold outline of the land; and there
appear to be some harbours for larger vessels.

The northern portion of the western basin, or the Gulf of
Leseo-tea, is imperfectly known, as the European vessel has sailed
up to its most remote recesses. The shores are rocky and
high, and they increase in elevation and steepness as they
proceed farther north. But in spite of the rocky nature of
the country the navigation is fair, and the adjacent
coast is of moderate depth. Some good harbours for large vessels
are known to exist, and it is supposed that several others may
be found when this portion of the Huang-hai is better known.

The upper part of this gulf is the site of a small
barren and nearly destitute of trees, but between them and
the shores there are many fertile and well-cultivated tracts.

The water in the western basin of the Huang-hai is of
a dirty yellow or green, which colour seems to be derived
from the mud, which constitutes its bottom. There
are a few small islands in this part of the sea, but the group of three
islands, called the Montos Islands, which lie partly in the
strait between the western and eastern basins, are of moderate
to extent and well cultivated and populous.

The eastern basin of the northern portion is very little
known. Only the most southern part of it, that which washes
the north-eastern coast of Corea, has been navigated by Europeans,
and in these parts the navigation is safe, and there are only a few rocky islands. The
soundings are regular and moderate, and there are some
harbours for smaller vessels. The northern unknown part is
represented on the Chinese maps as containing several
extensive groups of islands, especially along the shores of the
Peninsula of Corea, near the characteristic

The most southern part of the Yellow Sea, or that which
lies south of a line drawn from the most north-eastern cape of
the Peninsula of Shan-tang to the coast of Corea at the
back of James Hall’s Island, is a large sandy coast,
which extends from the mouth of the river Hong-ho and the
south-west cape of Corea nearly seven hundred miles wide, but grows narrower
as it proceeds north, being near its northern boundary, barely
more than two hundred miles across. The shores of this part
the Hong-hai are high and rocky, with the exception of a tract of about sixty miles contiguous to the mouth of the Hong-ho on the north, where the country consists of alluvium. From this point the coast is generally low, and may be again left East, and the sea is full of shoals and sandbanks. On the opposite side, along the coasts of Corea, the sea to the distance of fifty or sixty miles from the continent is littered with islands and rocks, which are generally small. Though the number of islands renders the navigation dangerous, and requires great caution on the part of seamen, they contain numerous excellent harbours. The straits which separate the islands are generally from one mile to two or three or even four miles across, and are all close harbours, capable of containing in security all the navies of the world. They form, in fact, an almost endless chain of harbours communicating with each other. They appear to be all inhabited, and therefore must possess fresh water.

Though the Yellow Sea is not visited by European vessels, navigation is very active, as it washes those parts of China Proper which are most populous and best cultivated, and where the manufacturing industry is carried to the highest perfection. Seamen who have connexions with the coasting trade along this coast, or are seen in the harbours, is very great, and sometimes excites the surprise of European navigators; but along the coast of Corea these vessels are rarely met with.

Corea is a country on the south coast of Corea, in the British possession of China; MacLeod, Narrative of the Alcete's Voyage to the Yellow Sea; and Basil Hall, Account of a Voyage of Discovery to the West Coast of Corea, &c.,

The Royal Academy, and sent several works to its early exhibitions. He died at Bath in 1792.

In 1788, the celebrated Captain Cook as draughtsman on his second voyage to the South Seas; and his drawings were published in Cook's narrative. After the completion of this work he went to India, where, under the patronage of Warren Hastings, he resided a considerable time, and returned to London in 1784. About 1790 he made a tour on the Continent of Europe, visiting Russia; and he exhibited a view of St. Petersburg at the Royal Academy in 1793. In 1795, finding that the demand for his pictures was on the increase, he established a bank at Dartmouth in Devonshire, which however broke two years afterwards in consequence of the devastations of the French in Newfoundland. The shop was closed on the death of his partner, the third son of March; and his wife, his third, died a few months afterwards. He was elected a member of the Royal Academy in 1787.

Hodges was not a painter of great ability; in style he resembled Wilson, but with little success; his best works are— a view of Windsor from the great park, and three or four views painted in India. He painted also two or three historical pieces for Boydell's Shakespeare. His last works were two ordinary landscapes illustrating the effects of peace and war, which he exhibited with twenty-three others, one of which was a large view of Falonette's equestrian statue of Peter the Great at St. Petersburg, in Old Bond Street; one was a seaport in prosperity, the other a town in decay, both of which have been engraved, are now in Sir John Payne's collection. Several of the works of Hodges have been engraved; he himself executed a set of Indian views in aquatint, which he dedicated to the East India Company. He published also an account of his Travels in India, with plates.

(Edward's, Anecdotes of Painting, &c., P. C.)
HOERBERG, Fehr, a distinguished Swedish painter, was born in a village of Smaland, in 1746; his father was a private soldier and extremely poor. Hoerberg's youth was spent in poverty, watching the event colored to take a labor. But, and like Giotto's, his first efforts were made with sticks or chalk in the woods when performing his pastoral duties. When only fourteen years of age he entered the service of a painter, when the king of Sweden was in a very small period. However, by the time he was two and twenty years of age, he contrived to learn so much from one painter and another in his own district, that he was enabled to maintain himself by his practice, and in a very short time he came to his nephew the late Earl of Cardigan, who was his sole executer and residuary legatee. A story was circulated about Sir Nathaniel Holland, that when he became possessed of his great estate at Cranbury House, he resided at Cranbury House near Winchester, and he died suddenly in that city on October 15, 1611, aged about sixty-eight. Lady Holland survived until 1625, when she died, leaving personal property to the amount of about £600, 000. It is said that she came to her nephew the late Earl of Cardigan, who was her sole executer and residuary legatee. A story was circulated about Sir Nathaniel Holland, that when he became possessed of his great estate at Cranbury House, he resided at Cranbury House, and that he spent thousands in the repurchase of his own works, for the purpose of destroying them to obliterate the recollection of his ever having been an artist. This story, however, is not generally believed, and the warm execution and distinct from some of his friends, is contradicted also by the fact of his continuing to paint and exhibit, and of his presenting pictures to his friends; it is also absurd to suppose that people of rank would part with the portraits of their relations for a pecuniary consideration to the painter, to enable him to destroy them. The report was no doubt magnified from the fact that he destroyed some of his most celebrated works in his own possession, because he thought that they were not calculated to add to his reputation. All his best works however still exist, but chiefly in private collections. The Marquis Camden, for Sir Nathaniel had contributed three to the exhibition of the works of deceased British artists at the British Institution in 1817—Orpheus, and Garrick as Richard III.; two of his very best works; and Charles, Earl Camden, Lord Chancellor. The following are also attributed to him—Timon of Athens, of which there is a fine print by J. Hall; Virginia, scraped in mezzotint by J. G. Haid; and the death of Mark Antony, engraved by T. Watson. Dance painted many portraits, including both royal personages and his own, and latterly also some landscapes; the last work which he exhibited was 'A View in the New Forest.'

It has been also reported that Sir Nathaniel saved 200,000l. out of his wife's estate, but this report is not true; but he distributed only 30,000l. among his relations, the residue was bequeathed to his widow. These reports have been here noticed, more particularly because they have been carelessly repeated and with considerable asperity by the writer of an article on George Dance in this work. [P. C. S.] They appeared in the 'Gentleman's Magazine' for 1811, and in part, in 1825, but have been contradicted in subsequent editions of Pilgrim's ; upon their insertion in 1894 in the 'Somerse House Gazette,' they were immediately afterwards contradicted in that same work, and an apology was made for their appearance. The statement that Dance and the other artists did not communicate with any of Sir Nathaniel's friends, or that work would have certainly condemned them also.

(Somerset House Gazette, 1894; Gentlemen's Magazine, 1811, 1812; this work) says that the Rooms of the British Institution, from 1818 to 1828.)

HOLLAND, HENRY, holds a high rank among the architects of his own time, and was greatly patronized by George II. He was a member of the Royal Academy of Fine Arts, and was employed in the decoration of the rooms of the British Institution, from 1818 to 1828.)

HOLLAND, SIR NATHANIEL, historical, landscape, and portrait painter, was the third son of Dance, the architect of the Mansion House, who died in 1658, and the younger brother of George Dance, R.A., the architect of Newgate. Nathaniel Dance was the pupil of Hayman, and he studied also a few years at Rome. He was one of the original thirty-six members of the Royal Academy, founded in 1768, though he cannot have been at that time more than twenty-five years of age. He contributed many works to the academy exhibitions as Sir Nathaniel Holland, as well as Nathaniel Dance. He changed his name to Holland upon his acquisition of the property at Cranbury House in 1694, having married Miss Dunker, who was connected with several noble families. This lady was possessed of estates, chiefly in Hampshire, including Netley Abbey on the Southampton river, to the value of 10,000l. per annum. Upon his acquisition of his title, Sir Nathaniel Holland appears to have resigned his academical diploma, from for that time he exhibited as an honorary exhibitor. He represented for some time the borough of East Grinstead; he resided at Cranbury House near Winchester, and he died suddenly in that city on October 15, 1611, aged about sixty-eight. Lady Holland survived until 1625, when she died, leaving personal property to the amount of about £600,000. It is said that she came to her nephew the late Earl of Cardigan, who was her sole executer and residuary legatee. A story was circulated about Sir Nathaniel Holland, that when he became possessed of his great estate at Cranbury House, he resided at Cranbury House, and that he spent thousands in the repurchase of his own works, for the purpose of destroying them to obliterate the recollection of his ever having been an artist. This story, however, is not generally believed, and the warm execution and distinct from some of his friends, is contradicted also by the fact of his continuing to paint and exhibit, and of his presenting pictures to his friends; it is also absurd to suppose that people of rank would part with the portraits of their relations for a pecuniary consideration to the painter, to enable him to destroy them. The report was no doubt magnified from the fact that he destroyed some of his most celebrated works in his own possession, because he thought that they were not calculated to add to his reputation. All his best works however still exist, but chiefly in private collections. The Marquis Camden, for Sir Nathaniel had contributed three to the exhibition of the works of deceased British artists at the British Institution in 1817—Orpheus, and Garrick as Richard III.; two of his very best works; and Charles, Earl Camden, Lord Chancellor. The following are also attributed to him—Timon of Athens, of which there is a fine print by J. Hall; Virginia, scraped in mezzotint by J. G. Haid; and the death of Mark Antony, engraved by T. Watson.
nearly a square in plan, the depth being almost equal to the breadth. The Ionic colonnade screen in front of Carlton House was censured at the time, not for its real deficiencies, but as an architectural absurdity in itself. It was objected as a violation of the picturesque character of the street, and was supposed nothing, whereas at any rate they were essential for the support of their entablature, and the entablature was requisite for connecting together the two gateways; therefore had there not been such open colonnades, it would have been a wall shutting out a view of the portico from the street.

While Carlton House and its fine portico have disappeared without being recorded by any engravings intended as architectural or picturesque emblems of the metropolis, the 'Illustrations of the Public Buildings of London' being both too few and upon too small a scale to serve such purposes), another work of Holland's, for the same royal patron, and which has also disappeared, though in a different manner — namely, the Pavilion at Brighton, as it existed previously to its being transformed into its present shape by Nash — has, unluckily for the credit both of the architect and his princely employer, been preserved in Richardson's 'New Vitruvius Britannicus.' As a residence for the Duke of York, Holland altered Featherstonehaugh House, Whitbould (built by Paine), adding to it the elliptical entrance-hall, on which was originally the 'Great Corridor,' and the staircases, following the designs of John James - this, which was afterwards called Melbourne House and is now Dover House, would have been in every respect a far more interesting and distinguished piece than 'Virgin's Room,' viz. than the preceding one; nevertheless, not only is it omitted there, but has never been edited in any elevation of it, though in such separate form the composition and design was so admirable, and the resource of piercing the colonnade rather than in the building itself, it being too low and upon too insipid a scale for a piece of street architecture, and for its actual situation.

Holland erected old Drury-Lane Theatre, that is, the structure which was begun in 1791, and burnt down in February, 1809; and which was considerably larger than the present one, their respective dimensions being 930 x 165 and 234, 7 x 169, 9 feet. It was designed by Mr. George Dance, and the edifice made scarcely any pretensions to architecture externally. He was also the architect of another building in the metropolis, of considerable architectural distinction, the India House, Leadenhall Street, the credit of which has, rather strangely, been generally given to Richard Japp, who was only the Company's surveyor, and the conductor of the works, the design, and consequently the architecture, belonging to Holland. And it might be in some respects un-usually florid in character, the frieze of the portico (a recessed Ionic hexastyle loggia) being highly enriched, like that of Carlton House, the pediment filled in with sculpture, and its accessories, of course, like the other house.

Of the rest of the façade however is by much too plain and undisguised to accord with such degree of embellishment cons-

The lady who lived in the front room, and threw her head from the window, saying merely horizontal joints, will bear no compari-

son with that classical mode of such decoration which was exhibited by him in the façade of Carlton House and Dover House, and which he used in all his country houses, where the cornices alone being continued all along the rest of the front, for which there is some reason, since otherwise the cornices of the windows would have joined the architrave.

Holland also made alterations in the mention built by Brown [Browns, P. C. S.] at Clarendon, and added the colonnade screen wings to the Assembly Rooms at Glasgow.

He died at his house in Hans Place, Sloane Street, Chel-

He had no children, and never married. He had, if possible, no more reason to live to witness the destruction of his Drury-Lane by fire and that of Carlton House, his finest work, by demolition.

HOLLAND, HENRY RICHARD VASSAL FOX, LORD., was the only son of Stephen, second Lord Holland. His mother was Mary, daughter of John Fitzpatrick, first Earl of Upper Ossory.

Sir Stephen Fox, Knight, distinguished for his magnificence and public spirit, as well as for his great wealth, having in 1705, as the age of seventy-six, married a second wife, the Rev. Charles Hope of Naseby in Lincolnshire, had by her, besides a daughter, two sons, Stephen and Henry, both of whom were created baronets in 1742, the elder being the third son. Stephen became Earl of Ilchester; and Henry, who figures in our political history as the rival of the first Pitt, was, in 1768, raised to the peerage as Baron Holland, of Vauxley, in the county of Wilt, his lady having the year before been made Baroness Holland, of Holland, in the county of Lincoln. Both baronies passed to his descendants.

The eldest son of the first Lord Holland was Stephen, the second lord; his second son was the Right Hon. Charles James Fox, the statesman and orator.

The subject of the present notice was born at Winteralow House, in Wilts, 21st November, 1773. On the 9th of January, 1774, that mansion, a splendid building, was destroyed by fire, and the infant was with difficulty saved from the flames, his mother, who rescued him at the risk of her own life, having, however, in so doing, taken probably the only direction by which she could have made her escape.

On the 1st of October, 1790, he was created a Peer of Great Britain. Lord Holland; on the 24th of the same month, his grandmother Lady Holland; and on the 26th of December in the same year, his father, the second Lord Holland; on which he succeeded to the peerage, when he was little more than a twelvemonth old.

His mother died in 1778, and then the care of the child's education devolved on her brother, the Earl of Upper Ossory. After having been for some time at a school in the country, he was sent to Eton, where he spent eight or nine years, and where George Canning, Mr. Freere, the present Lord Carlisle, and other persons who subsequently rose to distinction, were among his schoolfellows. Upon the death of his father, October, 1790, he was entered as a nobleman at Christ's Church, Oxford; but all that is told of his academical career is that he took the 'very dry' degree of master of arts, in right of his rank, in June, 1792.

It appears to have been before leaving the university that he made his first visit to the Continent, in the course of which he saw Constantinople, Athens, and Greece. In 1795 he returned to Italy; and there, at Florence, in the beginning of the year 1796, first met Lady Webster, the wife of Sir Godfrey Webster, with whom he returned to England in June, 1796, and whom he married the next year, after she had been divorced from her first husband, who obtained 65000. damages in an action against Lord Holland. (See the particulars in the Annual Register for 1797, pp. 10, 11.) After his marriage with Lady Webster, Lord Holland assumed, by sign manual, her family name of Vassal, which however has been laid aside by his children.

He now took his seat in the House of Lords. His first speech in that House was made on the 9th of January, 1798, on the motion for committing the bill for trebling the assessed taxes. He addressed the House both early in the debate, and again at its close, in which he took a prominent part, and his successful reply to Lord Grenville, who, while he complimented the young peer on the ability with which he had spoken, had noticed some of his remarks in a way that was considered to be disrespectful. On the division, nevertheless, Lord Holland found himself one of a minority of six against seventy-three; so that he had early and emphatic experience of the position in which he was to pass the greater part of his political life. He bore also on this occasion a system which he probably carried to a greater extent than any other peer ever did, by entering a long protest against the bill on the Journals of the House. This first of Lord Holland's long series of protests, many of them very able, was printed for the information they contained, was signed only by himself and Lord Oxford (the present peer).

From this date Lord Holland took a frequent part in the debates for the next four years, being at all times one of the most ardent opponents of the administration, and seconding in the Upper House the principal efforts of his uncle Charles James Fox in the Commons. Among other measures which met with his opposition was the union with Ireland, which he contended (8th May, 1800) would both impoverish that country and endanger the constitution of England. A few days before this (on the 8th of April) he had made the usual speech against the British Commercial laws against the Americans, which after the war was defeated by the consideration by a committee of the whole House. This motion, the first of the kind that had been made in the Lords, was got rid of by the previous question without a vote.

Meanwhile, in 1800 before the war was suspended, he
had paid a visit to Germany, and returned from Dresden by Cologne and Brussels, having obtained a French passport from Talleyrand, and liberty to make use of it from Lord Grenville, then foreign secretary. In the summer of 1811, after the peace of Amiens was terminated, with Lady Holland, to Paris, and there was soon after joined by Mr. Fox, along with whom he was introduced to the first council. From Paris to London Lord Holland proceeded through France, to Spain, and they remained in that country till after the breaking out of the war with England in January, 1805, returning home through Portugal by means of passages, though the Prince of Wales had been written to.

He now resumed his attendance in the House of Lords; and his name, as before, appears frequently in the reported debates. He was not admitted to office during the ministry of Mr. Grenville (1802); but on the 29th of August he and Lord Auckland were appointed joint-commissioners and plenipotentiaries for arranging and settling the several matters in discussion between this country and the United States, with Mr. Munro and Mr. Finckney, the United States commission; and on the 27th of the same month he was sworn of the privy council. An arrangement of the differences with America was effected after a long negotiation (with the omission however of the impeachment question); but Mr. Jefferson refused his ratification, and it came to nothing. On the 15th of October, after the death of Mr. Fox, Lord Holland was appointed lord keeper, and held that office for the six months longer that the Grenville ministry lasted.

In 1806, Lord Holland became an author by the publication of ‘Some Account of the Life and Writings of Robert Southey, Esq.,’ in two volumes 8vo. This work, which was reprinted in 1817, when it was extended to two volumes by the addition of an account of Guillen de Castro and other matter, is creditable to his lordship’s taste, and familiarity with the popular parts of Spanish literature, without being very learned or profound. It had the merit, or luck, of leading the way in the revival of that interest in the literature of Spain which has since prevailed to some extent in this country, though it spread more rapidly at first than it has done of late years—a difference to be attributed partly to the allurement of novelty and the perusal held out by an unexplored field, but more perhaps to the political circumstances and events which for a time drew so much attention to every thing Spanish. Lord Holland followed up his Life of Lope de Vega the next year by another octavo volume entitled ‘Three Comedies from the Spanish,’ and in 1808 he edited and introduced by a preface of some length Mr. Fox’s fragment entitled ‘A History of the early part of the Reign of James the Second.’

Outside the interests of the Spanish connection in this last-mentioned year, he hastened once more to visit the peninsula; and he remained there till the latter part of the year 1809. The rest of his public life for many years was a compromise in the course of opposition to the government with which he had set out on his entrance into parliament. He took a leading part in most of the great questions that came before the House of Lords, and participated in his support of Sir Samuel Romilly’s law amendments, by his advocacy of Catholic emancipation, and his opposition to the orders in council, the cessation of Norway, and the detention of Bonaparte at St. Helena. However opinion may differ as to the positive wisdom of his politics, the praise at least of consistency cannot be refused to him. He was one of the stedfast Whigs of the school of Mr. Fox. But in those days the boundaries of party were much more clearly marked than they are now, and there was but little of inconsistency that was possible. He always overran the one camp to the other, changing from Whig to Tory or from Tory to Whig. These two great parties had then a distinct existence, and did not slide off into one another as they do now.

And when the unsuccessful attempt was made through the Marquess Wellesley to effect a union of parties in January 1811, and Mr. Fox’s acceptance of office in the ministry of Lord Castlereagh, it is not to be imagined that he was satisfied upon that principle Lord Holland should occupy the post of First Lord of the Admiralty. Like the majority of his party he supported without joining the ministry of Mr. Canning in 1822. He made what has been called the best speech in introducing the Bill for the repeal of the Test and Corporation Acts to the House of Lords. At last, on the accession of the Whigs to power in November 1830, he became once more a cabinet minister as Chancellor of the Duchy of Lancaster; and this office he held (with the exception of the ministerial interregnum of a fortnight in May 1832, and Sir Robert Peel’s four months’ tenure of power from December 1840 to April 1841) until his death at Holland House in the 52nd of October 1840. He was succeeded by his son, the present Lord Holland.

The only performances which Lord Holland sent to the press before the latter's death were an ‘Admonitory Letter to the Rev. Dr. Shuttleworth in favour of the Catholic Claims,’ 8vo., Lon., 1837, and ‘A Letter from a Neapolitan to an Englishman,’ which is stated to have been privately printed in 1818, and translated into Italian by Orlando Furioso (1827), together with a version of the 25th Canto of that poem, which is stated by Mr. Rose to be the performance of an old schoolfellow, who may perhaps be Lord Holland. As a speaker Lord Holland was more animated than graceful; when he began, in particular, he was usually for some time extremely impeded and embarrassed; and he never rose from this hesitation into any thing like the fine and impetuous torrent of argument or the impassioned declamation by which his relative Mr. Fox, after a similar unpromising outset, used to carry every thing before him. But his speaking had always the great charm of honesty and earnestness; and, so far as it commonly occurs, he knew ever little of what could be called brilliancy, a well-informed and full mind. Lord Holland was much beloved by as extensive and varied a circle of friends as perhaps any man who had lived in the last sixty years. His name, with its earlier history, was during all his lifetime the resort of the most distinguished persons both in the world of politics and in that of literature.

(Gentlemen's Magazine for December, 1840.)

HOLOSTEUM (from 8ar, 'all,' and 8erw, 'a bone,' an antithesis applied to this plant because it is soft and unlike bone), a genus of plants belonging to the natural order Caryophylline, and the sub-order Alatici. It has 5 sepals; 5 petals, toothed at the end; 3, 4, or 5 stamens; 3 styles; a sub-ellipsoidal many-seeded capsule, opening at the end, with 6 teeth. The species of this genus are herbs with nothing to recommend them for use or cultivation. One species, H. umbellatum, is British. It has umbellate flowers, pubescent viscid peduncles, the pedicles reflexed after flowering, the leaves acute, elliptical, or elongated. It is not a common plant, but has been found on old walls and dry places at Norwich, Bury St. Edmunds, Eye, and Yarmouth. (Babington's, Manual of British Botany.)

HOLZER, JOHANN, a distinguished German franco painter of the early part of the eighteenth century, was born at Burgis, near Marienberg in Vincagruen, in the Tyrol, in the year 1709. He was first instructed in the police of painting by the German painter, Marienberg, and Holzer was first instructed by N. Ascer at Meran in the Tyrol. He made here such extraordinary progress that at the early age of eighteen his reputation spread far into Germany, and he was invited by the painter J. A. Merlin, of Straubing in Bavaria, to assist him in some frescoes in the convent church of Oberleiteich. From Straubing Holzer went to Augsburg, where he lived six years in the house of the painter J. G. Bergmiller, from whom he learnt much in the mechanical department of painting, both in fresco and in oil, for Bergmiller was the principal painter in Augsburg at that time, and was much employed. Holzer painted many magnificent pictures of history and portraits; but few, if any, now remain; there is however a collection of twenty-eight prints after them by J. E. Nilson, entitled Picture a Fresco in Zohlius Augustin Vind., &c. Holzer, among the other things, did in Munich, in a peasant decorated beer shop, was a very popular work; and it is spoken of in the highest terms in the letters of J. L. Bianconi and Count Algarotti. The neighbouring peasant girls at that time were extremely adored for his beauty, and formed a model in the forms of their legs were accordingly fully displayed; and Bianconi speaks with enthusiasm of the beauty and life of the young peasant girls in this painting; the figures were above 4 feet in size, and the lines were lively and graceful; the frescoes of the convent church of Schwarzbach near Wurzburg; he obtained the commission to execute them by competition; and they were painted in 1737, when he was only twenty-nine years of age. They are the best works that were...
executed at that time in Germany; and Holzer is by some considered the founder of the new era of German fresco painting. They are however now in a most dilapidated condition; the church being in a ruinous state and the convent is a paper mill. Dr. Weiss, who was not the most impartial of men, in the Convent of Schwarzach in his account of the works of art in Frankfort, though it contains many works besides the frescoes of Holzer, his work is not mentioned by him; they are said to be inferior to those by Holzer. Holzer painted the cupola and ceiling of the church; the subjects represented are—the Glorification of St. Benedict; the Transfiguration; the Pentecost; the Assumption of the Blessed Virgin; St. Felicita and her Seven Sons; the Foundation of the Convent; and the Papal Confirmation of the Foundation. The martyrdom of St. Sebastian is described as the most successful composition.

After the completion of these works, Holzer was invited by the prince bishop of Wurzburg to paint his palace, for which he made the designs, but they were not quite satisfactory to the bishop. He was in the meanwhile invited by the Elector Clement of Cologne to paint the newly established capuchin convent at Clemenswerth, and he accordingly immediately prepared himself for this work. He however did not feel confident to commence it; he died of a fever at Clemenswerth, a few days after his arrival, in July, 1740, at the age of thirty.

Holzer's works are described as successful in every department of art, in invention, form, character, light and shade, and treatment; and the subject matters represented by him have been published in Germany; the first in 1765, at Augsburg, and the last in the Tyrol in 1834. In the latest account of the subject called Johann Evangelist Holzer; see Nagler, Künstler Lexicon.

(Zapf, 'Leben Johann Holzers,' printed in Meusel's Medicines Artistischen Inhalts, 1781.)

HOMOPATHY, the art of curing founded on resemblance, expressed in the Latin expression 'similia similibus curantur.' It is derived from the two Greek words 'σίμως, ' similar,' and 'κατά, 'feeling' or sensation, and hence a condition of body, such as that of disease. According to this law, disease is cured by remedies which produce upon a healthy person effects similar to the symptoms of the complaint under which the patient suffers.

This system of medicine stands in direct contradiction to that founded on the principle of treating diseases by their opposites, 'contraria contrariis curantur,' which has served more or less as a guiding law since the time of Galen. To this last method the disciples of the new school have given the name of Allopathy, from the two Greek words 'ἄλλος, 'other,' and 'πάθος, 'condition.' This distinctive nomenclature will be allowed in this article, as a matter of convenience, and to avoid circumlocution. The proponents of homoeopathy assert the truth of the homoeopathic law, which is directly and actually stated in the works of eminent medical men of different schools and various epochs, and from experiments upon healthy individuals made by the founder of the system and his disciples upon them.

1st. Popular experience has shown that the safest manner of restoring the circulation of a frozen limb is to rub it with snow (similia similibus); warm applications, according to the evidences of the same experience, would cause the destruction of the part affected (contraria contraria).

Again, severe burns are most quickly cured by the use of heated spirits of wine or oil of turpentine, which excite a very similar sensation, although generally a greatly modified degree (similia similibus). Cold applications, although they give temporary relief, are, as is well known, generally followed by increased inflammation and severe after-suffering (contraria contraria), as corroborated by the evidence of John Hunter, Kentish, Sydneyham, and other medical names of high repute.

The homoeopathists also insist that the acknowledged effects of a physician's great discovery is a powerful argument of the truth of the homoeopathic law, since by producing a similar disease an almost perfect immunity from attacks of the small-pox is obtained.

It is not for us however to show by a number of observations collected from the works of different medical allopathic authors, that many drugs recorded by them as curtive in different forms of disease were observed by others, also allopathists, to produce effects analogous to that observed by them for the treatment of the same disease, or in other words, that they acted upon the principle, similia similibus; an instance or two will be sufficient illustration.

The English sweating sickness, which committed such ravages in the year 1485, and for some time baffled the physicians, yielded, according to Willis, to sudorifics; and it is upon record that after the adoption of this mode of treatment very few died of it. Gilibert gives several cases of the consumption, a deep and heavy sleep; and it has, according to the testimony of many allopathic physicians, proved curative in diseases characterized by cold symptoms. Moreover, it is asserted by the homeopathists that the law is recognised by those who, as specifics by the medical profession, of whatever school, act upon this law; for instance, they maintain that Peruvian bark produces mediately the same effects as cinchona, and therefore the marsh fever, and that the well-known efficacy of mercury in syphilitic complaints, and of sulphur in various forms of cutaneous disease, is attributable to the same power (similia similibus), and as above stated, that the action of vaccine matter, as a prophylactic or preventive medicine against small-pox, depends upon the same law.

Assuming, therefore, that the position of the homoeopathists is supported by the arguments which they advance, and that the law upon which specifics act has been clearly ascertained, it would seem to be incumbent upon those who have dedicated themselves to the advancement of the healing art to endeavour, by personal experiment and careful observations upon the effects of medicines upon the human body in health, to add to the numbers of this class of remedies, and in this manner materially to improve the treatment of disease. This view of the subject appears to the author, by the observation of the homoeopathists and other great names in medicine. Dr. Alison, professor of the University of Edinburgh, observes, 'The increasing efficacy and usefulness of homoeopathic medicines has been manifested by which may be expected in the discovery of specifics which may counteract the different diseased actions of which the body is susceptible as effectually as the cinchonas counteract intermittent fever, citric acid the scurvy, or vaccination the small-pox.'

Sedly, Dr. Samuel Hahnemann, the founder of this system of medicine, being struck, as noticed in his life [Hahnemann, P.C.S.], with the close analogy between the symptoms produced by Peruvian bark and those of the forms of disease for which it was considered a specific, and having obtained similar results from other medicines tried upon his own person, was led to the discovery of the homoeopathic law; and he, believing that the mode of operation of all remedial agents was in perfect harmony with this principle, by repeated experiments upon himself and some medical friends, converted to his opinions, first determined their direct action and then employed them in disease. The practical results obtained by himself and the physicians of his school are appealed to by them as a further confirmation of the truth of their fundamental law.

The extremely minute quantities in which the remedies are administered seem to form a marked difference between the homoeopathic and all other schools of medicine. The homoeopathists hold that the dose used in the treatment of the disease is to be determined by the physician at the bedside of his patient, and that in the application of the homoeopathic principle to the treatment of disease, it was soon found that remedial agents in that dose used were too energetically upon a frame already predisposed to their influence by the affinity existing between their medicinal effects and the morbid signs of the disease; and hence a gradual diminution was made in the quantity of the medicine exhibited, in order to approximate to that amount which might exert its full curative power without aggravating the sufferings of the patient by an excess of medicinal action.

The result has been, the homoeopathists adopted the practice of determining the dose used in that present in use, which perhaps more than any other cause, from its discrepancy with generally received opinions, has prevented any impartial investigation into the principles of the new system by the profession at large.

Homoeopathic numbers in its ranks many medical men who had obtained high repute and proficiency in the other systems before they embraced the principles of homoeopathy, and seems to be more or less diffused in all parts of the world, if we may form any opinion from its literature, which comprises books published in British, French, Spanish, Italian, and Portuguese. The system has also adherents in North and South America and Asia. The great bulk however of the medical profession in these countries are to one degree or another opposed to the formation of the system.

HOMICIDE [MURDER, P.C.]

HONE, WILLIAM, was born in 1779 at Rath, where
HON

HON

his father is stated to have been an occasional preacher among the dissenters. He is said to have been rigid in his religious views, and that he would not suffer his son to be taught to read out of any other book than the Bible. William was placed at the age of ten in an attorney's office in London; but his father found that he had attained to manhood for himself to some reforming society and began to take part in what he seems to have thought very objectionable politics, removed him to another master at Chatham, with whom he remained for three years. He was then returned to London, and was engaged for some time as clerk to an attorney of Gray's Inn; but at last he quitted the law, and, having married, set up in July 1800 as a bookseller, with a circulation of about one thousand. For some time he moved to what was then called St. Martin's Churchyard, in the neighbourhood of Charing Cross; and here he appears to have remained stationary for several years, although it is stated that he was once burnt out, and also underwent many vicissitudes in business. He had always been fond of literature, and in 1806 he brought out his first publication, an edition of Shaw's 'Gardener.' After this he devoted much of his time to an attempt which he made in conjunction with a friend to establish a savings bank in Blackfriars Road, which, however, failed. He then entered into partnership as a bookseller with this friend, Mr. John Bone; but the speculation ended in bankruptcy. When he got upon his feet again he established himself in a shop in May's Buildings, whence he removed to High Street, Bromley; and here he appears to have remained till 1811, when on the retirement of Mr. John Walker he purchased his bookseller's business in Lime Street, which is called the 'Trade Auctioneer,' and placed in a counting-house in Ivy Lane. Before this he had been employed to compile the Index to the new edition of Lord Berners's 'Translation of Homer,' a work which was now taken to the investigation of the abuses in lunacy asylum, he soon became bankrupt again. The date is not given in the account from which our abstract is derived; but it is stated that he had three children, whom he took to a humble lodging in the Old Bailey, and endeavoured for a time to support by contributing to periodical publications, especially the 'Critical Review' and the 'British Lady's Magazine.' At length, however, he found means to set up once more as a bookseller in a small shop in Fleet Street. Here he was again unfortunate in having his premises twice broken into and plundered, much of the stock that was carried off having been borrowed; but he seems to have weathered these disasters; and in 1815, it is stated, he became publisher of the 'Traveller' newspaper. In that year he exerted himself most praiseworthy humanity and spirit in the investigation of the case of the unhappy Elizabeth Fenning, executed on a charge of poisoning of which there can scarcely be a doubt that she was innocent; and he published a very striking able report, in which he added his own name from the title-page (except as the publisher), and giving the literary credit to a Dr. John Watkins, who only contributed three letters, forming the least interesting part of the report. The volume professes to be printed for William Hone, 55, Fleet Street. In 1816 he commenced a weekly paper called 'The Reformer's Register,' but it does not seem to have gone on long. The next year, however, he brought himself into great notoriety by a series of political satires, published as separate pamphlets, which had immense success, the effect partly of their literary merit, partly also of the wood-cut embellishments from the clever and humorous designs of Mr. George Cruikshank, whom they first made generally known to the public. One of them, 'The Political House that Jack Built,' went through fifty editions, besides producing a host of imitations. Together with another, 'Harlequin's Assistant,' he held an encircling attack upon the since defunct daily morning paper called 'The Times,' its editor Dr. (afterwards Sir John) Stoddart, and the Constitutional Association, on 'Bridge Street Gate.' In 1817 he published his 'Man of Feeling,' which has sold to the amount of two hundred and sixty thousand copies. The volume turned out the most productive for the author were three composed in the manner of parodies upon various parts of the Book of Common Prayer. For the printing and publishing of these parodies Hone was sentenced to death in three severest indictments in the Court of King's Bench, on the 18th, 19th, and 30th of December, 1817; the first day before Mr. Justice Abbot (afterwards Lord Tenterden) to be continued and tried before Lord Ellenborough. He defended himself on all the three trials (which were before special juries); and, notwithstanding the best exertions of the bench to procure a con-
HONG

island from east to west is stated to be about eight miles; but its breadth is very irregular, and varies from about six miles to two miles. The coast-line forms a succession of small bays and headlands. The chief bays are Victoria Bay, with its fine sandy beaches, in the north; and Victoria Harbour, opposite both the town of Victoria and Victoria Harbour itself. The Victoria Harbour, on the other hand, is a small body of Chinese police. The command of cheap labour to any extent has been one great cause of the rapid progress of the town of Victoria. In June, 1841, when the British forces disembarked in the Bay of Hong Kong, there was no house on the island fit for the residence of Europeans, and Sir H. Pottinger, the resident missionary, lived, with his family, in a tent. During the first months that the settlement remained between tents and huts were erected; but in the month of August, 1841, the site of Victoria was still covered with brushwood. Within a year after the first house was built, there had been constructed regular streets and bazaars for the Chinese, numerous large storehouses, substantial wharves and jetties, two European hotels and billiard-rooms, and various public buildings. The government had begun the formation of an excellent road along the front of the harbour at the foot of the hills, which was carried to a distance of four miles; and it has since been extended, and other roads have also been made, and bridges erected. In consequence, the road between the beach and the base of the mountains, the town necessarily stretches in a line, which is about three miles in front of the harbour. The distance from one end of the town to the other is about five miles, and the site is so situated as to be in some other situation than to be desirable. In July, 1844, a liberal arrangement was made with a body of Chinese shopkeepers, who had been allowed to settle in a district which is about the centre of the town and the centre of the European town, and they were removed to another part of Victoria, where a large number of their countrymen were already settled. The government does not grant land in perpetuity, but assigns it on leases for seventy-five years; and there is a clause under which it is to be given up at a valuation assessed by twelve jurors, on oath, if required for public purposes. In 1844 the government derived an income of 900,t. from ground-rents; and its revenue from this source was rapidly augmenting.

Early in 1845 the governor of Hong Kong legalized the opium trade. In March the privilege of renting the island was granted to a mercantile house at 730 Spanish dollars a month. All the houses in which opium is sold must adjoin the street, and they may be open from day-light till ten in the evening, except on Sundays, when they are to be closed. No person is to be admitted into these houses with any kind of weapon or edged tool. There is a tax on salt, and a duty of 24 per cent. on sales by auction. Victoria is a free port, and, like Singapore, its prosperity must depend upon its commerce being freed from all restrictions which can properly be dispensed with. In May, 1845, the currency was regulated by a proclamation which had previously been sanctioned at home by the privy council. The gold or silver coin was to be equivalent to 29s. 2d.; the East India Company's rupees, coined since September, 1845, to 1s. 10d.; Spanish and Mexican dollars 4s. 2d.; and 226 cash are declared to be equivalent to 20s. 3d.

(Bernard, Voyages and Services of the Nemi, London, 1844; McPherson, Two Years in China, 1842; Lock, Campaign in China, 1848.)

HONTHORST, or HUNDHORST, GERHARD, called by the Italians Gherardo dalle Notti, from his night and candle pieces, was born at Utrecht in 1592. He was the pupil of A. Bloemaert, studied some time in Italy, and was engaged for six months by Charles I., in England. He painted Charles's sister, the Queen of Bohemia; the portrait is now at Hampton Court. There are also at Hampton Court—James II., when young; the Duke of Buckingham and family; and a large painting on the queen's staircase, of Charles I. and his queen, as Apollo and Diana, sitting in the clouds, and the Duke of Buckingham below as Mercury, introducing the Arts and Sciences to them, while several game are driving away Easy and Malice. For these paintings Honthorst received 3000 florins, a service of plate complete for twelve persons, and a beautiful horse. Honthorst was the favourite painter when the Queen of Bohemia and her sister were in his native country. In 1637, he was elected as a court painter to the Prince of Orange. He died at the Hague in 1660. He had a remarkable number of scholars, especially among the Dutch; his pupils, as we learn from the register of his pupils. His style of execution is much like that of Guercino; his pictures occur frequently in European galleries.

Vor. II. G.
Hood, in this situation, became acquainted with several persons who have distinguished themselves in English literature, and he is said to have contributed to the "London Magazine," with Lamb, Carey, Croker, Cunningham, Bowring, Barton, Haslitt, Elton, Hartley Coleridge, Talford, Soane, Horace Smith, Reynolds, Poole, Clare, Benyon, and others. With Lamb especially it became of great intimacy, which continued till Lamb's death.

Hood's first publication in a separate form was "Odes and Addressas to Great People," in which he was assisted by his brother-in-law, J. H. Reynolds, and which was brought out anonymously. "Whims and Oddities," published in 1836, in small 8vo, consisted chiefly of his contributions to the "London Magazine," with some additions. His next work was in prose, "National Tales," sm. 8vo, which was followed by "The Plea of the Midsummer Fairies, Hero and Leander, Lyceus the Centaur, and other Poems," sm. 8vo, 1837, a volume of serious poetry which obtained praise from the critics, but little favour from the public. His experience of the unpleasant truth that "Those who live to please must please to live," induced him to have recourse again to his lively vein. He published a novel, "D.IsNulla," in 1838, and a second novel, "The Principal Mill," in the third series in 1828. He commenced the "Cosmic Annual" in 1829, and it was continued nine years. In the same year his comic poem of "The Epping Hunt" came out, and excited much notice; it is an interesting poem, and a view of the city and its scattered suburbs. He was for one year editor of "The Gem," and wrote for it his poem called "Eugene Aram's Dream."

In the spring of 1831 Hood became the occupier of a house called "Leicester House, belonging to the proprietor of Wanstool, in Essex, near which it was situated. While residing here he wrote his novel of "Tyneley Hall." Pecuniary difficulties compelled him to leave his pleasant residence. The "Hobbit," a comic meta. "Tyneley Hall" is dated Lake House, Oct. 20, 1834. He left it in 1835.

The "Cosmic Annual" having terminated in 1837, Hood commenced the publication of "Hood's Own," in a series of monthly numbers, in 8vo, 1838. It consisted chiefly of selections from the prose and poetry which he had published in the series of the "Cosmic Annual," with several additions. A portrait of himself, for which he sat at the request of the publisher, is attached to the work, and is, as he says himself, a faithful likeness.

Hood went to the court for the benefit of his health, but while in Holland the unholy air of the marshes produced a result so disastrous as to balance all his success. He finally succumbed to his misfortune in the spring of 1835, and the nation mourned the loss of a poet. His "Hobbit," "Cosmic Annual," and "National Tales," are valuable contributions to literature.

"The Hobbit" is dated "Leicester House, London, 1834.

"The Hobbit" is dated "Leicester House, London, 1834."

In 1834 Hood started his last periodical, "Hood's Magazine," and continued to supply the best of its contributions till within about a month before his death. Those who have read the work, and have a taste for wit, humour, and character, will not readily forget his "Schoolmaster's Assistant." Mrs

HOOD

HOOD

HOOD

(Sanford, Tuteni Acadeae, &c.; Walpole, Anecdotes of Painting, &c.)

HOOD, THOMAS, was born in 1798, in the Poultrey, London, where his father was a bookseller, of the firm of Vernon and Bingley. Thomas Hood was sent to a school in Tookenhouse Yarn, in the city, as a day-boarder. The two maiden sisters who kept the school, and with whom Hood took his dinner, had the odd name of Hopedash, and so the young poet was a regular visitor to "Mr. H.' and who subsequently became the prototype of Charles Lamb's unsuccessful farrce called "Mr. H." Hood was afterwards sent to a preparatory school, and in due course transferred to a school in the neighbourhood of London, but derived little benefit from either.

In 1811 Hood's father died, and soon afterwards his elder brother died also. Thomas Hood being then the only remaining son of the widow, she was anxious to have him near her, and recalled him home. In 1812 she sent him to a day-school. His account of this school and its master is so characteristic as to be worth extracting from his "Literary Reminiscences" ('Hoan's Own,' p. 292). "In a house, formerly a suburban seat of the unfortunate Earl of Essex, over a grocer's shop, up two pairs of stairs, there was a very select day-school, kept by a decayed, Domincan, as he would have called it in his native land. In his better days, when my brother was his pupil, he had been master of one of those wholesale concerns in which so many ignorant men have made fortunes, by favour of high terrorism, or the obnoxious parties, and cherished little benevolence. As our worthy Domincan, on the contrary, had failed to realize even a competence, it may be inferred, logically, that he had done better by his pupils than by himself; and my own experience confirms the fact that he attended the interests of his scholars, however he might have neglected his own. Indeed he less resembled, even in externals, the modern worldly trading schoolmaster than the good honest earnest oiled pedagogue—a pedant perchance, but a learned one, with whose teaching was a labour of love, who had a proper sense of the dignity and importance of his calling, and was content to find a main portion of his reward in the honourable profession of his calling, a provision out of which he suppers with his coffee, and enters the national tarian. A quaint carved highbacked elbowed article, looking like an émigré from a set that had been at home. In an aristocratical drawing-room under the ancient régime, was his professorial chair, which, with his desk, was appropriately elevated on a dais some inches above the common floor. From this moral and material eminence he cast a vigilant yet kindly eye over some dozen of youngsters; for adversity, sharpened by habit of parting with friends, had not sourcd him, or mellowed a single tinge of the peculiar red-streak complexion so common to the healthier natives of the north. "In a few months my education progressed infinitely farther than it had done in as many years in London. He was superintendent and assistants. I picked up some Latin, was a tolerable grammarian, and so good a French scholar that I learned a few guineas—my first literary fee—by revising a new edition of "Paul of Virginia" for the press. Moreover, as an accountant, I could work a nominen bonus, that is, a good sum."

From this school he was removed to the counting-house of Messrs. Belcher, Bros., Russia merchants, Wannford Court, City, but his health soon began to fail, and he was sent to a Scotch snuc to Dundee, and consigned to a female relation, who otherwise refused to take charge of him, and even reshipped his luggage, and had sent him here. He had not played her an evasive trick, and frustrated her intentions. He immediately took lodgings for himself in Dundee. He was then fifteen years of age, and seems to have been left entirely to himself. For the first while he was not idle, but had no taste for dissipation, but took great delight in reading, as well as in rambling, fishing, and boating. His health gradually improved, and, after remaining two years at Dundee, he returned to London. He engaged for a short time in the sand, an engraver, who was his uncle, in order to learn his art, and was afterwards with Le Keux for the same purpose.

In 1821, Mr. John Scott, then editor of the 'London Magazine,' gave him a small salary for his contributions to its pages. He read extensively, and was always addressed with Le Keux for the same purpose.

Gardenier,' and his novel of 'Our Family,' which was inter-
rupted by his last illness and death: the last chapters were 
in fact written by him when he was propped up by pillows in 
bed. He had the conception, a short time before his death, 
of a novel, 'A Song of the Shirt,' which was offered to him by Sir Robert Peel, transferred at his own re-
quest to his wife. After a lingering, which continued four 
days, he died, May 8, 1846. He was buried on the 10th of 
May in Kensal Green Cemetery, his wish to die un-
disturbed being fulfilled.

Hood left two children, a girl and a boy, of whom the girl 
is the eldest, and is now (1845) about fourteen years of age. 
She is very fair, lively, and attractive, and it is believed she 
will raise a fund for the benefit of the widow and children.
The amount already realized (Nov. 1845) is between 1400L. 
and 1500L.

Hood was undoubtedly a man of genius. His mind was 
stored with a vast collection of materials drawn from a great 
variety of sources, but especially his own observations; and he 
posessed the power of working up those materials into combi-
nations of wit and humour and paths of the most original 
and varied kinds. His vigilance of observation must have been 
extraordinary. The appearances of nature, the forms and usages 
of society, great diversity of characters, all arts, professions, and 
trades he was in his mind to supply the demands of his rapid 
subtle and versatile imagination. He has wit of the highest 
quality, as original and as abundant as Butler's or Cowley's, 
drawn from as extensive an observation of nature and life, if 
not from a larger one. His genius was tempered with the 
richness of humour of which Butler had little and Cowley none. 
His humour is frequently as extravagantly broad as that of 
Rabelais, but he has sometimes the delicate touches of Ad-
donis. As a punster he stands alone. He is peculiar in his 
instinct of double meanings of words, a low kind of punning 
of which minds of a lower order are capable, and with which his 
initiators have defiled English comedy and comic literature, 
but of which he has done things which are impossible. His mean-
ings of sense in such a manner as to produce the most extra-
ordinary effects of surprise and admiration. His power of 
exciting laughter is wonderful, his drollery indescribable, 
immatelible. His pathetic power is not equal to his comic, but 
it is very great. In some of his 'National Tales,' as well as 
in his singular poem of 'Eugene Aram's Dream,' he produces 
an effect upon the feelings which is sometimes little less than 
sublime. His 'Song of the Shirt,' which he wrote a short 
time before his death, was a burst of poetry and indignant 
passion by which he produced tears almost as irrepresentably as 
in other cases he produces laughter.* In his 'Plea of the 
Midsummer Fairies, Hero and Leander, Lycidas, the Centaur, 
and other Poems,' he supports a poetic character quite different 
from those in which he usually appeared. Without a trace of 
any affectation or portentousness he plays a graceful and 
delicacy of fancy, a tenderness and 
sweetness of feeling, a choice of diction, and beauty of versifi-
cation, which render these serious poems exceedingly delight-
ful. They are rich in thought, and grafted upon the 
form and structure, it may be inferred that it cost him much la-
bour, if not much time. In extension of the neglect of the 
public, it may however be observed that such poems can never 
be appreciated by the public. His poems are not intended with 
the elaboration of sense with which others have combined them; 
they are allegorical and mythological, and entirely out of the 
limits of actual existence. As a novelist Hood has considerable 
merits. He has a flowery and the exuberance of his imagination to 
such a degree as to interrupt the course of the narrative, and, 
by diverting the reader's attention, to weaken his interest in 
the story. Some of the characters, too, are injured by what 
may be called the intrusion of his wit, by which both the 
thoughts and language are often rendered less interesting. 
These objections however are much less applicable to 'Our Family' 
than they are to 'Tynley Hall.' They are defective as novels, 
but they are mixtures of wit and humour.

The rule but graphic and humorous sketches by which 
many of his comic works are illustrated, are for the most part 
very slightly connected with the works to which they are 
annexed, and seem to be introduced merely for the sake of 
the whim, as some pun or odd fancy occurred to him.

The moral tendency of Hood's works is excellent. In 
the indulgence of his spirit of fun he is anything but strict-laced 
as regards the introduction of images and phrases which a 
fastidious person might call vulgar or coarse; but an indelent 
curiosity, or use of coarse description, or even a genteel

* In the course of the year 1845 public feeling had been much excited 
by cases of 'smut' and 'sentiment' which came before the London police mag-
istrates, sometimes for very trivial causes. Daring the smut case, the law rate of 
sentencing was increased, and during that year village women were made 
made for their complaints. Taking advantage of a market which was not yet 
put with the most unchristian and brutal of these women were done, should be noted 
that the process was much more frequent than was required in order to 
organise support. Hood was as well of the 'sentiment' of his proceedings. Hood's sympathy was excited, and the 'Song of the Shirt' was the result.

HOOK, THEODORE EDWARD, was born Septem-

He was the son of James Hook, a musical composer of some 
celebrity in his day, by his first wife (Miss Madden), a beau-
tiful, accomplished, and excellent woman. There was only 
one other child by that marriage, Dr. James Hook, dean of 
Worcester, who was born in 1773, and died February 6th, 1828. 

Dr. Hook married a daughter of Sir John 
Sibthorp, a Quaker, of Sibthorpe, near Histon, in 1797; and wrote 
two musical pieces, 'Jack of Newbury,' 1796, and 'Diamond cut 
Diamond,' 1797, which were never printed; and two clever 
poems, 'Pen O'wens,' 1797, and 'Percy Mallovy,' 1798. 

Mr. Theodore Hook's mother died in 1802, while he was yet a school-
boy at Harrow; his father did not send him again to school after 
the funeral; and not long afterwards he married again. 

Theodore Hook was always remarkably clever. He 
advanced, as an ear performer on the piccolo, a 

hook, having a strong and sweet voice, and sang a 

hook, having a strong and sweet voice, and sang a

declared that 'something must be done for Hook,' and late in 1812 something was done for him;--he was appointed Lieutenant-General and Treasurer of the Colony of the Mauritius, with a salary and allowances amounting to nearly 2000l. a year. He reached the island on the 9th of October, 1818, being then only twenty-five years of age.

The climate, the society, the amusements, everything delighted him, and he indulged in the most lavish expenditure. Ten years later, in 1827, General Hall, who had sailed for England, and Major-General Hall was sworn in as deputy-governor during his absence. An examination of the accounts and state of the treasury took place, and the report of the auditor declared that everything was in order. Afterwards, however, a man of the name of Allan, who was in the treasury department, made a declaration that he knew and had long known that there was a deficiency of 27,000 dollars. Further examinations took place, more deficiencies were discovered, and the result was that Hook was arrested on the 9th of March, 1818; all his property was seized, and he was sent back to England in custody.

The ship reached Portsmouth in January, 1819, and the documents were submitted to the law-officers of the crown. The attorney-general's report was, that though Hook might be liable to a civil prosecution for debt, there was no apparent ground for a criminal prosecution, and he was set at liberty with only two gold mohurs in his pocket.

He took a small cottage in Somers Town, and formed connections with newspapers and magazines, thus being enabled to supply himself with the present means of subsistence. He lived in obscurity, and was known only to a few of his old associates, such as Matthews, Terry, and Tom Hill.

In 1819 he hitched his horse, Scott was in London, and, dining one day with his old friend Terry, met there Matthews, and, for the first time, Hook. The inquiry into Hook's defalcation was still before the audit-board, and the proceedings were represented to Scott as a cruel persecution; he was much pleased with Hook's conversational powers; they were both staunch Tories; and Scott having soon afterwards been applied to by a nobleman of influence to recommend an editor for a provincial newspaper, named Hook. Hook, however, was not destined for provincial celebrity. The 'John Bull' newspaper, established, was published, with Hook for its editor. The career of the 'John Bull' is well known; its attacks upon Queen Caroline and her supporters, its virulence, its personalities, and the talent which raised its circulation to so great a height.

Hook, in its prosperous state, received full 2000l. a year from it; and though its circulation gradually diminished, he derived a considerable profit from it up to the time of his death.

Meanwhile the Whigs took care that the inquiry before the audit-board should not be dropped; and the result was, that at the first balance found against him was 30,000l., which on the requisition of the government was reduced to the extent of 12,000l.

Hook admitted at an early date that the deficiency was 9000l., but afterwards asserted that a strict scrutiny would have struck off 3000l. from his account. There is no proof of a fraud on the part of Hook; but there is proof that he himself and his officers kept the treasury books with the most culpable and scandalous carelessness, and that the keys of the treasure-chest were frequently lost with underlings while he was absent on pleasure excursions. In August, 1823, he was arrested under a writ of Exchequer, his property was sold, and realized about forty pounds, and he was taken to a spangling-house in Shire-lane, Fleet-street, where he remained till April, 1824, whence he was transferred to the Rules of the King's Bench, and he remained there till May, 1825, when he was released from custody, but with an intimation that the crown abandoned nothing of its claim for the debt. He then took a cottage at Putney.

Hook published his first series of 'Sayings and Doings' in Feb. 1825, in a spangling-house, and his diary records the profit to have been 300l. He reached his destination of 'Sayings and Doings,' First Series, 3 vols., 1824; Second Series, 3 vols., 1825; Third Series, 3 vols., 1828; 'Maxwell,' 3 vols., 1828; 'Life of Sir David Baird,' 2 vols. 8vo., 1822; 'Parson Darnel,' 3 vols., 1833; 'Love in a Village,' 3 vols., 1834; 'Gilbert Gurney,' 3 vols., 1835; 'Jack Bragg,' 3 vols., 1837; 'Births, Deaths, and Marriages,' 3 vols., 1839; 'Gurney Married,' 3 vols., 1839; 'Precepts and Practice,' 3 vols., 1840; 'Fathers and Sons,' 3 vols., 1840; 'Peregrine Bunce,' 3 vols., 1841, some months after his death. In 1830 he became editor of the 'New Monthly Magazine,' and 'Gilbert Gurney,' 'Gurney Married,' 'Precepts and Practice,' and 'Fathers and Sons,' were originally published in that periodical. He also wrote 'Kelly's Reminiscences,' from Kelly's notes, in 1856, without remuneration, and merely out of kindness to his old friend.

While residing at Putney he gradually mixed more and more from the literary world. In 1827, General Hall, who was at the Island Row, St. James's, which has since been the residence of a wealthy nobleman; he became a member of a young first-rate club, received invitations from persons of the highest distinction of the metropolis, and got into such a depth of debt, notwithstanding the large sums which he obtained by his literary labours. By his ambitious and criminal extravagance, which he supplied at a ruinous expense of labour of mind and body, his constitution, excellent as it was originally, was completely broken up. In July, 1841, when dining at Brompton, he was observed to be unwell, and as he stood with the coffee in his hand, turned suddenly to the mirror, and said, 'Ay, I see I look as I am; done up in purse, in mind, and in body too at last.'

From that time he was confined to his house. About the middle of August he requested the Rev. Mr. Gleig, chaplain of Chelsea Hospital, who was an old acquaintance, but had never been at his house, to pay him a visit. He did so, and being known to the servant as a clergyman, was admitted. The state of his house was somewhat confused at being caught in disshabille, but after a moment's pause, observed, 'Well, you see me as I am at last—all the bucklings, and paddings, and washings, and brushings, drop for ever—a dirty, grey-headed man, with my knees.' He had latterly been much made-up. He died Aug. 24, 1841, in the fifty-third year of his age. His novel of 'Gilbert Gurney' contains a sort of autobiography of himself.

While living at Somers Town he had become acquainted with a young woman, and by her he had six children; she was respectable, and he always behaved well to her, but he had not as near a relation to her, though according to his diary, he had sometimes thoughts of doing so. A few hundred pounds were subscribed for her and the children after Hook's death. He was a good-natured man, and willing to do acts of kindness, but he had no moral principles sufficiently strong to restrain the impulses of the moment.

Hook's conversational power was greater than his power as a writer. He was an admirable narrator, abounding in smart sayings, which, if recorded with skill and humour, were said as to appear the best things ever uttered, and could intermix serious remarks full of good sense and derived from a wide observation of life. His volumes are full of the most excellent descriptions of the various forms of life with which he had been conversant, rapid but striking sketches of character, and laughable extravagances, conveyed in a clear, unmeaning, and almost a peroration on some subject, for a popular writer, but is not likely to continue popular long. His novels will shortly share the fate of his dramatic pieces, and be forgotten. His satirical poems are little better than doggerel, and the points, now that the circumstances which gave rise to them have passed away, seem very blunt indeed; his power in these poems was generally in the coarseness of his invectives, not in satirical wit, of which indeed he had little, and that of inferior quality. There are many songs written by him which have never been published, and it is doubtful whether they are worth publication. (Quarterly Review, May, 1842, an entertaining and instructive article written in a fair and moderate style by Hook well; Gent.'s Mag., Oct., 1841, a bad article, written in a spirit of dull ennui.)

HOGLAN, A.D.C., deceased from the wealthy family of the 'Hoggs' of Amsterdam, and possessing with more than ordinary taste far more than ordinary means of cultivating and gratifying it, this gentleman established for himself a reputation of incomparable excellence, as the head of a mere amateur and collector, since he did much in behalf of art, both with his pencil and his pen.

Mr. Hope, who was born about the year 1770, gave very great precedence to the cultivation of his deportment, bearing to that branch of art which seems so much more than any other to depend upon acquired rather than natural and instinctive taste. 'From an infant,' as he himself tells us, 'architecture was always my
HOPE

favourite amusement. I was scarcely able to hold a pencil, when, instead of flowers, landscapes, and all those other familiar objects of which the imitation chiefly glories the facility of such children as show a turn for design, I already began dealing in those straight lines which seem so little adapted to the requirements of a more advanced age. No sooner did I become master of myself, which unfortunately happened at the early age of eighteen, than discarding the useful pursuits of my father's profession only in the consciousness of a closed, I hastened in quest of an interest for it in all the different countries where any could be expected. This valuable little scrap of autobiography amply illustrates the occupations and earnings I sacrificed to his encouragement of his youth and education. At the age of eighteen or nineteen, then, he went abroad, and remained there several years, occupied all the while very differently from most young men of fortune who visit other countries, for his passion for architecture induced him to explore regions that were then considered almost beyond the track of civilization—to study the monuments of Egypt on the banks of the Nile; those of Ionia, Northern Greece, the Peloponnesus, and Sicily; those of the Tartar and Persian styles in Turkey and Syria; of the Moorish and Arabic on the coasts of Africa and in Spain; those of the Etruscan, Lombardic styles, &c. in Italy; and finally, those in the south of France, Germany, Spain, Portugal, and afterwards here at home.

Eight years, he tells us, were thus occupied by him with a persevering application that would have brought the most profligate and drunken young rake to more serious pursuits. He had attended with many fatigue and privations, and frequently with great risks.

Soon after his return to England he began to apply his studies practically by remodelling and enlarging his mansion in Duchess Street, Portland Place, extending the plan of the original house very considerably by galleries carried around three sides of the court-yard. Of these rooms, which are in continuation of the apartments on the principal floor, the largest one (about 100 feet by 24) is on the north side, and the others, coexisting respectively of a suite of small cabinets filled with Etruscan vases, with little to table, and the statue gallery on the west. And in addition to these, Mr. Hope added several years afterwards (1820) the Flemish Gallery, so called from being entirely occupied by productions of that school. He thus rendered his house one of the largest private mansions in the metropolis; and though he did not bestow on it the slightest beauty of exterior or even any regard at all to appearance, he fitted up and furnished the interior in a style of refined classical taste that was then a decided novelty in this country. His first and memorable publication on Furniture, in 1805 (a splendid folio volume with sixty plates, exquisitely engraved in outline, and profusely lettered with the name of each designer and the furniture and decorations of his own mansion), created a revolution in taste. But it also drew down upon him the merciless ridicule of the Edinburgh Review, which could not resist the temptation to call him a medievalist, and one perfectly indifferently whether good or bad taste be shown in such matters, the reform in furniture of which Mr. Hope set the example, and further promoted by that publication, was assuredly a desirable one; and though there was a good deal of absurdity and caricature in the ultra-classical affectations of vulgar and parodying imitators, a very improved style of furniture—one marked by greater simplicity and intrinsic beauty—of which his taste has taken place and still prevails, where it has not been superseded by the tawdry frivolity of the Louis Quatorze and other fashions.

He created his Costumes of the Ancients, which had also great influence in promoting a taste for classical design and study; and in the same year he contributed to a periodical (by J. Landseer) entitled Review of Publications of Art, an essay on the Architecture of the Ancients. Mr. Hope had been the first to discern and patronize the talent of Thorwaldsen, whom he commissioned to execute his Jason for him in marble, now in the gallery in Duchess Street. But he was not always so fortunate as to select worthy objects of patronage, for in one instance he bestowed it where it was altogether unmerited. Some dispute arising between him and a French artist named Dubois, the latter painted and modelled a statue of Hope, which he was requested by Mr. and Mrs. Hope, and announced under the title of Beauty and the Beast. As may be supposed, the affair, which occurred in 1810, made a very great noise at the time, but the exhibition was soon brought to a close in a very summary manner by Mrs. Hope's brother, who mediated the picture by thrusting his stick through the canvas. Dubois brought his action for the injury, but did not succeed in obtaining damages.

With the exception of a minor work entitled Modern Costumes, in 1812, Mr. Hope did not publish anything further till 1819, when appeared his Anastasias, or Memoirs of a Modern Greek at the close of the Eighteenth Century, but as his name was not at that time known or even suspected to be the author, that it was at first impressively attributed by many to Lord Byron, as the only person capable of having produced it; and certainly Mr. Hope's previous pursuits and occupations gave me by no means of a kind to point him out as likely to be the author of so powerful a work of fiction. Of his two last works, both of them published posthumously, one of them was still more remote from what may be supposed to have been the constant tenour of his studies, for that On the Origin and Prospects of Man was almost the very last subject that would have been expected from his pen: from furniture to cosmogony the distance is immeasurable. Abstruse in its speculations, it was also considered unorthodox in some of its opinions, on which account it was afterwards withdrawn from publication, while his Historical Essay on Architecture, first published in 1825, has, on the contrary, been received by the public and by the townsmen of London as a work of far more than a series of hasty fragmentary notes. In fact it seems to have been left by the author in an unfinished state, and not even have been before published by him. In the northern district, the plates of statues, frescos, and sculptures of Lombardic and other styles scarcely ever before represented in English publications, contributed not a little to the popularity of the Essay, but the information they afford is of a very imperfect kind; as they consist of little more than outline drawings of the façades alone of the respective buildings, without even so much as a scale to enable us to judge of their dimensions, nor does the text supply any information as to the plates. They are, however, disfigured by typographical errors and other mistakes, the first edition was brought out with so little regard to convenience as a book of study and reference, that there was not even an index to it; wherefore Mr. E. Creasy published the following year, an Analytical Index, but it ought to have been accompanied by an alphabetical one also.

Besides the above works, Mr. Hope was author of several minor productions and pieces of criticism, one of them being a Letter to James Wyatt, relative to his designs for Downing College, Cambridge, upon which he animadverted very freely and apparently very justly. Another work—if it may be called—of his, which he left to his friend Mr. Vernet, was never finished, although he did not entirely build, he very greatly enlarged, and greatly embellished both the house and the grounds, which contain a handsome family mausoleum.

Mr. Hope died August 3rd, 1831.

HOPPER, JOHN, R. A., was born in London in 1759. There is a mystery, says Cunningham, about his birth, which no one has ventured to explain: all that is known with certainty is, that his mother was one of the German attendants at the Royal Palace.

When young he was one of the choristers in the Chapel Royal. He studied afterwards in A Rial Academy of Arts; and before he was thirty years of age he had, owing to the active patronage of Prince of Wales, painted more royal and noble portraits than usually falls to the lot of distinguished portraits. During the time when Hopper was still distanced by appearance and fashion, for and eighteen years Lawrence was his only rival: Lawrence was patronized by the king, while the prince and his party patronized Hopper: Hopper's style is easy and effective, but gaudy; his heads have frequently much character, and are well modelled, though perhaps the opposite case occurs more frequently, especially in his male heads: he had also great skill in landscape painting. He died of dropsy in 1810. His son was for some years British consul at Venice.

At the Exhibition of deceased British artists, at the British Institution in 1817, there were seven portraits by Hopper, representing all the principal masters of his time, which he presented to the Royal Academy in 1809, upon his election as a member of that body. His portrait of Nelson was in the exhibition at the same institution, in 1820, of Portraits representing distinguished persons in the
HOR

ory and literature of the United Kingdom: it is, however, a less manly head than the one painted by Lemuel Abbott, which was engraved by J. Heath in 1801.

(Cunningham, Lives of British Painters, &c.: An Account of the Pictures exhibited in the Rooms of the British Institution, from 1813 to 1823.)

HORN. Mr. Arthur Aikin, in a paper on the manufacture of tortoiseshell, and whalebone, before the Society of Arts in 1832, and published in the fifty-second volume of their 'Transactions' (part ii., pp. 334-349), observes that 'in the English language we have only one word, 'horn,' to denote quite different objects, namely, branched bony horns of the stag genus, and the simple laminated horns of the ox genus, and other kindred genera.' Of the former kind, which are, with few exceptions, confined to the Cervidae, or antelopes, with species of Bos, and in which the species is given under Oks, P. C., p. 349. The uses to which they are applied are the same as those of bone and ivory, and the manufacture presents no point which requires notice. The other kind of horn, to which the French appropriately the same corne (while they apply the same boa to bony horns), is found in the ox, the antelope, and the goat and sheep kinds. Such horns, with the exception of those of the prongbuck [Antilocapre, P. C., p. 71], which are not referred to Aikin, are, he observes, 'never branched or palmed, but are always of a simile conical figure, more or less curved, and, in some of the antelopes, spirally twisted; they are found in both horns, and the growth of the goats and sheep much lasteth the male than the female. In all these animals, he adds, 'a bony core, of a loose texture and conical figure, rises from the bones of the forehead, covered by a permanent vascu- lar membrane, the tissue of which is so secreted thin layers of horn in constant succession.' It is sup- posed that one layer, or rather one set of layers, is produced every year; but, as the former layer remains closely adherent to the new one, such horns are not employed, lamellar in texture, and exfoliate only very slowly from the outside by exposure to weather and friction. The structure of such horns may therefore be described as a number of conical sheaths inserted into one another, the innermost, which lies upon the vascu- lar membrane which covers the bony core. The tip, or that portion of the point of the horn which projects beyond the core, is very dense, and the several layers of which it is composed are scarcely distinguishable; while towards the base the layers may be readily distinguished, owing to their successive terminations forming prominent rings. The horn proper is quite insensible, so that the tip may be cut off without giving pain to the animal; but if the core be cut into, bleeding ensues, and it becomes evident that pain is inflicted. Horn appears to consist of coagulated albumen; and Aikin translates the term lactica, used by the ancients for horns, into claws, hoofs, the scales of animals of the artiodactyl and to- toise kind, of lizards, serpents, and fishes, hair, feathers, and even skin. In the case of tortoiseshell and the armour, or ermine of the duck, and the sandal, the identity of the substance in appearance as well as in chemical character is sufficiently obvious; and the horns of the rhino- ceros appear to form a link with the hairy covering of lord mammalia generally. Next the bristles of the horse tribe, and the spines of the needlefish and porcupine. These horns are not formed upon a bony core, but are described as merely an aggregation of flattened hairs or bristles adhering by their sides, and presenting longitudinal pores or interstices of con- siderable magnitude at the base of the horn, and which become smaller towards the point, these interstices being, in the living animal, filled with a pulp matter. Whalebone, also, is described as consisting of two portions, the former illustrating the transition from horn to hair; but its uses in the arts differ much from those of horn. It is softened by boiling in water for some hours, and then cut into suitable lengths; the latter is usually prepared for purposes to which it is applied, by a longitudinal division being effected by splitting, or separating its fibres. It is usually of a dark colour, but that which appears jet black is dyed. It is much used in the manufacture of hats, and works of ivory in stiffening the edges of female dress, in whip-making, and in various other ways. While whalebone is also manufactured into very elegant bonnets, and occasionally into artificial flowers of great delicacy and beauty, and may be dyed by the painter. The principal kinds of horn employed in manufacturing operations are those of oxen, to which the hoofs of the same animals may be added. The horns of bulls and cows are pre- ferred; those of buckles being thin and of a coarse texture:

circumstance which seems to indicate some connection between the sexual functions and the development of the horns, similar to that mentioned under Deka, P. C., p. 350. Our dollar supply being unequal to this great demand, quantities of horn are imported from Russia, the Cape of Good Hope, and South America. The horns of goats and sheep, according to Dr. Ure (Dictionary of Arts, &c. art. Horn), are more white and whiter and more transparent than those of any other animals.

The first process in the manufacture of horn is to remove the bony core or pith, which is accomplished by steeping the horns in a solution of alkali, and peeling off the horn with fine chisels. Even after this process, the horn usually retains a thin account, or for about fifteen days in summer or a month in winter, according to Dr. Ure, by which operation the mem- brane which lies between the core and the horn sheath is so destroyed as to render the horn thin enough to be broken easily extracted. These, Aikin observes, are not thrown away, but are burnt to ashes, in which state they form the best material for the small tests or cupsella employed by sa- layers cold and silver. In some cases, according to Bal- tager (Economy of Machinery and Manufactures, ser. 270), instead of being thus used, the cores are boiled down in water, by which a quantity of fat is extracted, which, rising to the surface, is skimmed off and sold to the makers of yellow soap; while the liquid itself is used as a kind of glue, and is purchased by cloth-dressers for stiffening; and the remaining insoluble substance is crushed in a bone-mill for manufacturing the shellac, by which it is cut into small pieces and used as a frame-saw, and is employed for making knife-handles, umbrella-handles, the tops of whips, buttons, and various other articles. The remainder of the horn, which is employed for purposes of decraving, is thus laitered into small pieces, which may be left entire, or sawn into two or more lengths, according to the use to which it is to be applied. When divided, the lower part, or that next the root of the horn, is frequently employed for making the while the portion which has formed the middle of the horn is used for lanterns and similar purposes. To prepare the horn for use, it is immersed in boil- ing water for about half an hour, by which it is softened; and, when hot, it is easily worked, being cut with a file. It is then placed under a flame of a coal or wood fire, until it acquires about the tempera- ture of melting lead, and becomes so soft as to be semi- fluid. If the horn be from an old animal, care must be taken to expose the inside as well as the outside to the action of the flame. Mr. James, of Lambeth, a worker in horn, was re- warded by the Society of Arts in 1837 for a machine accomplishing this object much better than in the usual way. His apparatus, which is described in the forty-fifth volume of the Society's 'Transactions,' p. 164, consists simply of a block of cast iron pierced with a conical hole, and a conical cavity which opens off at the side of the block. The diameter of the hole is only a little larger than the diameter of the horn. These are heated in a stove or common fire to about the temperature of melting lead. The block is then taken out and placed on a firm support. A piece of the horn, which has to be worked, is fixed in the bay, and after the sides are slotted longitudinally, is then put into the hole, and the heated plug is dropped into the cavity of the horn. As the horn becomes softened by the heat, the plug is carefully driven in with a mallet; and by its pressure any original crookedness of the horn is removed. After remaining about a minute in this state the block is turned on one side, the plug is driven out, and the horn, which is sufficiently soft to be opened out flat, is removed. This apparatus is said to effect considerable saving of time, in addition to avoiding all risk of overheating the horn. In the more ordinary process, as described by Aikin, the heat is applied before the horn is slit; the slitting being performed while the horn is still whole, by means of a pointed knife resembling a pruning-knife; and, by the ap- plication of the pressure of a pair of pincers, one to each edge of the slit, the cylinder or cone of horn is opened until it is nearly flat. Several successive operations of the same kind are performed until, a lathe is turned, and the machine is heated and greased, to pre- vent the horn adhering to them, either in a press, or by placing them vertically in a strong iron trough, and compress- ing them, and, occasionally, the outer surface of the horn may be dyed by the painter.
twice, and for a blacker brown the dragon's blood may be added. This process, Aikin observes, is 'nearly the same as that employed for giving a brown or black colour to hair, and is called the painting process.' The prescription, which is an essential ingredient in alchemists' lead, dissolved in the alkaline, and thus introduced into the substance of the horn. Some other dyes are mentioned by Dr. Ure.

No part of the horn is more useful than the horn itself. But the oil which is the chief part of the horn is a valuable substance. When exposed to a decomposing heat in close vessels, horn produces a large quantity of the gaseous compound which forms the base of prussic acid, on which account hoofs and horns are in great request among the manufacturers of Prussian blue, and of the beautiful yellow prussiate of potash. The clippings of the comb-maker are also used as manure. 'In the first year after they are spread over the soil,' observes Babbage in the work above quoted, 'they have comparatively little effect, but during the next four or five their efficiency is considerable.' The shavings of the lamp-maker, from their extremely thin and divided form, produce their full effect more quickly.

Among the various uses to which horn has been applied, Aikin alludes to bowes, both ancient and modern, made either of wood or partly of this material, and to armour. He had seen a complete suit of arms which was said to have come from Arabia, made entirely of horn. The employment of this substance for glazing windows has long been superceded by the use of glass.

Hebert (Engineer's and Mechanic's Encyclopedia, vol. i. p. 683) alludes to a kind of artificial horn, the manufacture of which is said to have been established in France. It consists of powder obtained from bones, heated with muriatic acid, converted into a horny substance by tanning. Upon becoming hard and dry it resembles horn or tortoiseshell, both in appearance and in the facility with which it may be softened, by boiling in water with potash, and moulded to any required form. By inlaying with gold and silver, and staining with various colours, it may be rendered highly ornamental.

HORNER, FRANCIS, was born, Aug. 12, 1778, in the city of Edinburgh, where his father was a merchant. He was educated at the High School of Edinburgh; in 1792 he matriculated at the University of Edinburgh, where he pursued his studies till the summer of 1795. He was then seventeen years of age, and being disposed to select the law as his profession, his father sent him to England, and placed him under the care of the Rev. Dr. John Hewlett, of Shacklwell, in Middlesex, in order that he might get rid of his Scottish dialect, and gain some experience among strangers, as he had hitherto constantly lived at home. He returned to Edinburgh in Nov. 1797, and, having fixed upon the Scottish bar as his profession, at the age of twenty he laid down for himself a scheme of study which included almost every branch of science and literature. He studied Scotch law with his friend Henry Brougham, and in addition, with another friend, Lord Webb Seymour, he studied metaphysics and political economy.

In 1802 Horner began to have thoughts of exchanging the Scottish for the English bar, and in April of that year he came to London in order to work at the law, and fix his determination. His friendships and political opinions had associated him with the rising Whigs in Edinburgh; he was now received with acrimony by men of congregial opinions in London, as Mr. Abercorn, Sir James Mackintosh, Sir Samuel Romilly, and others. He resolved to attach himself to the English bar, and in the spring of 1803 he took up his permanent residence in London. It was an eventful and a stirring time. The war was again breaking out, the King's sanity was doubtful, and the Addington administration was giving way before the cross-firing of Pitt and Fox. Horner was not allowed to remain an unengaged spectator.

As his abilities became more known, his connections with the leading Whigs were extended. On the death of Mr. Pitt in 1806 the government was placed in the hands of Lord Grenville and Mr. Fox. Horner accepted a seat on the Board of Commissioners established by the East India Company for settling the Nabob of Arcot's debts, an unalarmed office, which however was to be remunerated at the close of the investigation. On the 15th of November, 1806, the Board announced that they had found itself an offer, through the intervention of Lord Kilmuir, of a ministerial seat in the House of Commons, which, after consultation with his friends, was accepted, and in Nov. 1806, he was returned for the borough of the old Whig party, which he had held together, immediately fell to pieces. A new parliament was summoned, and met on
H O R

the 16th of December. This parliament was very short-lived. A change of ministry took place on the 27th of March, 1807.

Horner was re-elected on the 27th of April, and was immedi-
ately afterwards dissolved. Horner did not obtain a seat at the general election, but in the following July was elected for the

The chief peculiarities in the construction of the principal clocks of church towers and public buildings are generally known by the name of church or turret clocks.

Turret-clocks differ from other machines employed for measuring time, not only in their greatly superior size, but also in the arrangement of their parts, and in the circumstances that they are usually made to strike the hours, and often the quarters also, upon large bells, and are occasionally connected with machinery for chiming whole tunes at certain intervals upon a set of bells which, when mounted in a church-tower, are so hung, that by disconnecting the hammers of the chimes and striking apparatus, they may also be rung in the ordinary manner by means of ropes. A popular description of the manner of striking on St. Mary-le-Bone's church, as given in the 'Penny Magazine' for 1842 (No. 641), describing a visit to a church-clock factory and bell-foundry, which is illustrated by a representation of the clock of St. Anne's Church, Lime-

district was the same as through the interest of the Marquees of Buckingham. In the sessions of 1813 and 1814 he took a prominent part in the debates, and contributed one of the ablest speeches in the House of Lords in the cause of the Ensigns. Grey was a Whig in politics.

The Marquees of Buckingham declined to accept his resignation. On the 25th of June, 1816, he made his last speech in parliament, in favour of the Catholic claims, and against the intolerant and harsh treatment which Ireland had experienced from the government of this country. Symptoms of a pulmonary disease had already begun to show themselves in his constitution, and he was ad-
vised by his physicians to spend the winter in the south of England. Accompanied by his brother, Mr. Leonard Horner, he set out on his journey, and arrived at Pisa in the latter part of November. His disease grew rapidly worse, but he had no suspicion that it was dangerous, and he continued to lay down plans for future studies of an extensive and beneficent

city at Leghorn, where a marble table-tomb was erected to his memory by his father. At one of the ends of the monument is a likeness of him in relief, of the size of life, by Chantrey. A marble statue of him, also by Chantrey, is placed in the north transept of Westminster Abbey, the cost of which was defrayed by subscriptions among his personal and political friends. It is one of Chantrey's best works, and indeed one of the finest portrait-statues in the Abbey.

The character of Horner's understanding was that of vigorous reasoning in pursuit of important and often difficult truth. He had no wit, and made no pretence to any. His knowledge was extensive, and his judgment accurate, not only in the various branches of political economy, but in a great many other departments of literature. He was one of the projectors of the Edin-

H O R

No. 117; and Watch, Reprint., P. C., p. 107, are further accounts of the different methods of ending time and striking upon bells. The principal object of this article is to supply information respecting some important modern improvements in the construction of the large clocks used in churches and public buildings in this country, and the names and buildings to which they are generally known by the name of church or turret clocks.

The name, which is often in large clocks, is made of wood, is about thirteen or fourteen feet long, its bob, or weight, being a mass of cast iron shaped like a double convex lens, about thirty pounds, and is supported by four heavy pulleys. Each of the four clock-faces is thirteen feet in diameter, and each pair of hands weighs about sixty pounds; but as the hands are very nicely balanced by weights attached to the
extremity opposite to the pointed end, the power required for moving them is much less than might be supposed. In some turret-clocks, indeed, the small size of the going-train and of the apparatus by which motion is communicated to the hands appears strangely disproportionate to the magnitude of the dial. In the Limeshouse clock, the head of the hammer by which the hours are struck weighs fifty-six pounds, and it is set in motion by the apparatus represented in Fig. 1, which may serve as an example of the striking mechanism of turret-clocks in general, although the details of course vary according to the relative situation of the clock and the barrel, which, in some cases, is the reverse of that here represented: the bell being above, instead of beneath the level of the clock itself.

Fig. 1.

In this cut a represents the pin-wheel, corresponding to the wheel f in the striking-train of the clock represented in Horology, P. C. 1, p. 300, Fig. 1, by the action of the projecting pins of which the end of the lever b, communicated through the levers c and e, the tail f of the hammer is depressed, and the hammer-head is consequently raised ready for a stroke. By the continued revolution of a, the end of the lever b, after being raised to a considerable height, is suddenly released, by which the hammer falls upon the rim of the bell, and the connecting apparatus resumes its original position ready for the next stroke. It must be borne in mind that the rod or wire d by which the levers c and e are connected, is here represented much too short, as in ordinary cases, it is of sufficient length to reach from one story of the tower to another.

Musical chimes, which form a pleasing though not very common addition to the mechanism of turret-clocks, require the addition of another train of mechanism, somewhat like to that which constitutes the striking-train, inasmuch as, like it, it is perfectly at rest for considerable periods of time, and is brought into action only at certain predetermined intervals by the action of the going-train of the clock upon a detent. The mechanism of the chimes very nearly resembles, on a large scale, that of a musical snuff-box; levers connected with hammers which strike upon a series of bells, being substituted for the springs which in the musical snuff-box are caused to vibrate by the projecting pins on the revolving barrel. Beautiful machinery has been introduced to facilitate the accurate pricking of the barrel, or insertion in their proper places of the pins which project from its surface; but the principle by which the series of hammers is regulated may be sufficiently explained by an account of the old method of performing it. A sheet of paper exactly equal in size to the surface of the barrel, and which, therefore, would completely cover it if wrapped round it and pinioned at the ends, in right angles with, the axis of the barrel, with as many parallel and equidistant lines as there are different notes in the tune to be performed, each of these lines indicating the position of one of the series of hammers projected by the hammer-head, and to whose right angles with the axis of the barrel, with as many parallel and equidistant lines as there were bars or equal divisions of time in the tune. These spaces were then subdivided by other lines, according to the number of minims, crotchets, or quavers in the bars of the required tune were marked by ink dots upon the paper on their respective lines and in the order of time in which they should be produced by the successive bars of the music and by the subdivisions of the bar. 'This done, the paper was placed upon the barrel, and the pins were inserted at the points indicated by the marks on the paper. This comparatively rude process, though inefficient for cases in which the sound is made, by shifting a little longitudinally upon its axis, to perform several tunes, indicates the principle common to the pricketed barrels of chimes, musical snuff-boxes, and barrel-organ.

Owing to the very limited demand for turret-clocks, and their great durability when well made and carefully preserved, the business of making them is confined to very few establishments, and has hardly been systematized into a manufacture, in the more definite sense of that term. Every clock being, in ordinary cases, made individually, and with comparatively little aid from machinery, turret-clocks have been very expensive, and in many cases inferior in accuracy and durability to many far simpler cheaper and more common machines, in the manufacture of which more extensive use is made of the lathe, slide-rest, planing-machine, and other contrivances for abridging labour and obtaining a higher degree of precision than could be secured by hand-labour. Mr. Dent, who had previously succeeded, in the face of much prejudice and opposition, in remedying a similar defect in the manufacture of chronometers, determined, when engaged by the Gresham Committee to make a turret-clock of unprecedented perfection for the new Royal Exchange, under the superintendence of Mr. Airy, the astronomer-royal, to meet this deficiency by establishing a clock-factory supplied with all the aids and appliances of modern ingenuity, in which the several parts of a turret-clock should be produced as far as possible in the same way as the component parts of a power-loom or other machine manufactured upon an extensive scale. By such a judicious outlay of capital it becomes easy, having once made the required models, to produce as many clocks as may be desired, the component parts of which, being perfected and which, while finished in a very superior manner, can be supplied at a cost greatly below that of what may be termed hand-made clocks. In the manufacture of smaller clocks and other horological machines, for which there is a more extensive demand, the application of manufacturing principles is even more important; and we may express a hope that the prejudices which have hitherto stood in the way of such improvements, and restrained the application of capital to this branch of ingenuity, are giving way. When the gentleman referred to above first introduced the use of the slide-rest in the manufacture of turret-clocks, his mode of proceeding, he concedes, in consequence of the jealousy of the clockmakers employed to use them, so continually out of order that he was compelled to call in the assistance of engineers to repair and work them; but now these clockmakers are brought together in the most cordial manner, and with the most satisfactory result.

One of the first points which would strike an observer in toe Exchange clock, and in other turret clocks made on the same principle, is the use of a simple but strong cast-iron framing, in which every strain is so completely self-contained that the operation of fixing the clock in its destined position is one requiring but little skill; whereas any of the ornamental required beyond the fixing of the frame on a firm and level base. Another, and a more unusual feature, which Mr. Dent has introduced into the turret-clock manufacture, although it is not adopted in the Exchange clock, is the use of cast iron wheels for the striking train, which is considerably larger than the going train. This peculiarity, which will be of great advantage, not only as a substitute of the mahogany durability of the metal, but also as tending greatly to reduce the cost of the clock, is not claimed as an invention by Mr. Dent, such wheels having been, according to information with which he has favoured the writer, used at the Registry Office in the past. In some old English clocks, we may state on the same authority, wheels of wrought iron were used, but the teeth of these had to be cut in the same manner as those of the ordinary conical wheel used in ships of war, while those of the cast-iron wheels are formed by the casting operation alone, from an accurate model. The wheels of the going train, which are not only smaller but require greater accuracy from the circumstance that any irregularity in their
action would impair the correctness of the clock, which is not
the case with the striking train, are best made of hammered
brass, which is a material more to be depended upon than gun-
metal. The wheels of both trains are formed with teeth of a
peculiar shape, on the subject of which Mr. Dent presented a
paper before the Royal Society in April 1664, in which
he states that the geometrical form of the wheel-teeth in
chronometers, watches, and clocks is seldom attended to by
the makers who either cut them from the wheel itself or
make the pinions with which they have been explained from the
circumstances of these operations being separated into two
distinct trades.

The system pursued by watchmakers to insure what they sup-
pose to be the geometrical form of the wheel-teeth is, he con-
siders, that it should, as nearly as possible, resemble the
shape of a bay leaf; while the terms geometrical circles or
pitch-lines are not understood.

Mr. Dent then proceeds to show that as the wheels of a clock move in one direction, an
opportunity is afforded of the teeth being so shaped that the
contact, or commencement of the force, may take place at
the line of centres, and, if possible, it should not take place before.

After cutting many experimental segments of wheels and
pinions, he adds, adopting various proportions in each case
beyond the geometrical circles, I came to the conclusion to
use for the wheel-teeth (the driver) the epicycloidal curve, and
for the wheel-teeth (the driven) the hypocycloidal curve, putting
nearly the whole of the curve on the wheel-teeth, in-
creasing the circumference beyond the geometrical circle,
by the addition of three teeth and spaces, allowing only 0.8 of the
pitch for the increase in circumference of the pinion, just to remove the possibility of any sharp edge.

In every case the epicycloidal curve has been described by roll-
ing the semi-diameter of the driven on the geometrical circle
of the pitch, whereas very nearly the proportions of the teeth
should be cut for the purpose of ascertaining the breadth that
the wheel-teeth should be in excess above those of the pi-
nion-leaves; for as the breadth of the wheel-teeth is in-
creased, and the leaves of the pinion narrowed, the effect of
driving before and after the line of centres is varied.

Mr. Dent has also applied this theory to the lifting of the
hammers, both of the striking apparatus and chimneys, by using
projections of an epicycloidal shape instead of the ordinary
round pins in the pin-wheel.

Among the other important features of the Royal Exchange
Clock, which are applicable to all others of similar character,
whether constructed with its peculiar contrivances for insuring
perfect accuracy or not, we may mention the use of hollow
iron drums instead of wooden cylinders for the driving barrels,
and the use of wire instead of hempen ropes for suspending
the weights. The first-mentioned of these improvements renders permanent accuracy of form more allowable, while
the latter obviates, in consequence of the much smaller size of the barrel, an undue elasticity for overloading, and is sufficient
length of rope may be coiled in a single layer upon the barrel
without increasing its length or diameter in an inconvenient
degree. The result is that the weight continually exerts the
same force, and the thickening of the barrel, while covering the barrel in two or three layers, its effective force is of necessity greater at the commencement of its descent, as it acts upon the circumference of the barrel plus the
thickness of the first or innermost layer of rope, than at the
latter part of its descent, when it acts on the circumference
developed on the barrel alone. Another important arrangement,
which, though formerly in use, had been departed from, and
is revived in this clock, is the driving of the hands of the
clock, and the raising of the hammer of the striking apparatus
directly from the axis of the driving-barrel, without the inter-
vention of the striking wheels and pinions.

In their determination to secure a public clock of unex-
spected accuracy, the Gresham Committee required that the
Exchange clock should have a compensation-pendulum, and
that it should be so constructed as not only to show perfectly
correct time upon the dials, but also to tell it with accuracy by
making the first stroke of the hour upon the bell true to a
second. This degree of precision is unattainable with the or-
dinary striking apparatus, as the effect of variations in the state
of the atmosphere upon the motion of the fly by which its
action is regulated, and of various circumstances affecting
the inertia of the machinery to be brought into motion, together
with the effects of expansion and contraction, the figure of the
vessel is not perfectly permanent and unchangeable, its changes are of a nature which is well understood, and may be calculated upon with accuracy. In such a case the clock is driven, and the time that the
lever by which the hammer is moved will become disengaged
from the pin or tooth of the pin-wheel by which it is
raised or depressed, render it impossible to adjust the mecha-
nism with certainty to produce such a result. In the Exchange
clock this difficulty is provided for by an arrangement for mov-
ing the lever and hammer to nearly the utmost degree required
before the time of striking, and causing the end of the lever,
which is formed in a peculiar manner for the purpose, to
remain poised delicately upon the rounded point of the projec-
ting edge of the pin-wheel when it is instantaneously released, and thus the stroke is pro-
duced without being affected by the preliminary operation of raising the hammer.

The principles upon which pendulums are provided with
compensations for changes of temperature are explained under Pendulum, P. C., pp. 402, 403. That of the Exchange
clock is an ordinary isochronous pendulum, well adapted for large clocks.

The centre rod of the pendulum is of steel, and is sufficiently long to pass completely
through the bob or weight, which, however, is not immedi-
ately attached to it. Upon the bottom of this rod is fixed a
nut, by turning which the length of the pendulum may be
nicely adjusted, and upon which stands a hollow or tubular
column of zinc, through which the steel rod passes freely.

On the top of the zinc column is a metal cap, from projecting
portions of which descend two slender steel rods, to the
lower ends of which the weight, which is a hollow cylinder of
iron, capable of sliding freely upon the zinc column, is sus-
pended. The relative position of these two smaller steel rods by which the weight is suspended, expand downwards upon any increase of heat, the position of the
weight in reference to the point of suspension of the pen-
dulum, and thereby determines the length of the pendulum,
though shorter than the central steel rod, expands, owing to
the different nature of the metal, to an equal extent upwards,
and consequently raises the weight just as much as it is de-
necessitated to maintain the proper length of the pendulum
for the position at which we are describing weights nearly four cwt.,
the operation of setting it to the required nicety, that its
beats might be correct to within a fraction of a second, was
a matter of extreme difficulty. This was met by a contrivance
suggested by Mr. Airy: the clock being started at a very
small losing rate, a slender spring so mounted as to touch the
pendulum, to prevent any small errors in the time of going, such being provided for by the use of small supplementary weights on the outer side of the top of the pendulum-wheel, which weights may be applied or removed without stopping the clock.

While on the subject of compensation, pendulums we may
observe that Sir John Robison, in his paper on the meas-
uration in 1838, in which, among other matters, he explains an
improvement which he had introduced in the construction of the mercurial pendulum, which is that generally adopted for
the very slow going clocks called marine clocks. In this
mercurial Clock. The ordinary construction of this admirable
pendulum, which is described and illustrated under Pendulum,
P. C., has the mercury in a glass jar, the fragility of which not only exposes it to the risk of fracture, but also renders
it unsafe to boil the mercury after filling it, to drive off the air
which it always contains. Further than this, while it is pos-
sible to give, externally, a mathematically correct form to
a glass jar, it cannot be made to be a perfect figure, and
consequently the column of mercury which it contains cannot be a perfectly regular cylinder. 'This condition,' Mr. Dent
observed, 'is the more advantageous with the iron jar, which
glass is peculiarly liable to from its compound nature, renders
measurement and calculation, with regard to the column, so
vague and deceptive that they are never employed.'

These defects he has removed by substituting a jar or cistern of
extraordinary form, and although these are affected by the effects of expansion and contraction, the figure of the vessel is not perfectly permanent and unchangeable, its changes are
of a nature which is well understood, and may be calculated upon with accuracy. In such a case the clock is driven, and the time
at which the lever by which the hammer is moved will become
disengaged from the pin or tooth of the pin-wheel by which it is
raised or depressed, render it impossible to adjust the mecha-
nism with certainty to produce such a result.
it may be instantly attached to the wheel-work by any workman capable of setting the clock upon its escutcheon; and if at any subsequent period, minute portions of air have, from any cause, again mingled with the mercury, and rendered the pendulum susceptible of barometric changes, the air may again be driven out by the greatest facility, as by the process of boiling, without removing the mercury from the cistern.

In connection with this improvement Mr. Dent has introduced some other alterations in the construction of the mercurial pendulum, among which is the attachment of the cistern directly to the pendulum-rod, and consequent removal of the metal stirrup or frame formerly used to carry it, and the prolongation of the rod so as to plunge its lower end into the mercury, near to the bottom of the cistern, an arrangement favourable to uniformity of temperature in the rod and mercury; and since the date of the paper we have quoted, he has, with a view to obtaining additional precision in the performance of the astronomical clock, taken out a patent for giving impulse to the pendulum at, as nearly as can be determined, the centre of percussion. In this arrangement, the pendulum, instead of being suspended below the clock, is suspended from a fixed point at the top of the clock-case, while the clock itself is at the bottom, the only connection between the two being effected by momentary contact, at the extremities of the range of the pendulum's vibration, with two slender pieces attached to the escapement. In the old arrangement, the inventor observes in his published *Abstract from Two Lectures on the Construction and Management of Chronometers, Watches, and Clocks*, delivered before the members of the United Service Institution, May, 1841,* the pendulum never vibrates independently of the mechanism of the clock; besides which, the impulse is given under very disadvantageous circumstances, as the greater part of the force communicated by the escapement is lost at the point of suspension.

In his patent astronomical clock, with the detached pendulum, these defects are in a great measure remedied, for he states that if the pendulum vibrates to degrees from the perpendicular, one degree and forty-five minutes will be entirely detached from the mechanism, and the irregularities occasioned by friction and other disturbing causes are avoided.

Returning to the turret-clock at the Royal Exchange, in which the connection of the pendulum with the wheel-work is of the more complete nature, the escapement is the next point which claims notice, though it is too complicated to be fully described without several figures. Its chief peculiarity is that it is of the remontoire kind, a circumstance in which it resembles some of the best public clocks in France; among others, that of the Bourre at Paris. To explain this it may be sufficient to state that the impulses imparted to the pendulum are not given immediately from the large going-wheel of the clock, but are transmitted from varying friction, from changes in the state of the oil used to lubricate the mechanism (the use of which, however, is limited to the least possible degree), and from the effect of the waves on the surface of the water, which in this case are nine feet in diameter; but these impulses are given by a small secondary train, set in motion by the descent of a ball or weight, which itself raised at intervals of twenty seconds by the mechanism of the going-wheel. The action is therefore very similar to that of a remontoire-spring, which, as used in some horological machines, is a small spring employed only to set the escapement in motion, it being itself wound up at very short intervals by the going-wheel, which receives its impulse from the prime mover. Such a contrivance favours accuracy of performance by detaching the escapement, by which the velocity of the machine is determined, or from the effect of the movement of time is affected, from the power, necessarily subject to some irregularities, by which the greater part of the machinery is kept in motion, whether that power be supplied by a weight or a spring. The effect of this is to prevent the dead-beat escapement, and has the pallet jewelled with large sapphires; but in his ordinary turret-clocks Mr. Dent uses a modification of Lepaute's escapement, over a single pin. In this clock, the same has been provided a satisfactory arrange-ment for maintaining the motion of the wheels during the time of winding up, which was invented a few years since by Mr. A. A. for the clock-work of the Mt. Northumberland telescope at the university of Cambridge, and of which he published a description in the *Transactions of the Cambridge Philosophical Society*, vol. vii. part ii. p. 217. Harrison's beautiful contrivance of the going-fusee, of which a description is given under Horology, P. C. p. 501, is not sufficiently powerful for application to large clocks, in which the strain of very heavy weights has to be provided for; but Mr. Airy's contrivance, which he describes as 'a new construction of the going-fusee,' supplies the deficiency. Its action will be understood from the annexed diagram, Fig. 5, which represents one of several forms of the apparatus shown in the illustrations of Mr. Airy's paper. In this diagram a represents the first wheel of the clock, which is mounted, as usual, upon the axis of the rope-barrel b, with a ratchet and click so arranged that the two must turn together whenever the rope-barrel is turned, by the action of the weight W, through the line l, in the direction indicated by the arrow; while, when the rope-barrel is turned in the opposite direction, to wind up the weight, by the action of a windlass on the axis of the wheel d, which engages the toothed wheel e on the axis of the barrel, the wheel a will not turn back with the barrel. f is the pinion which is turned immediately by connection with the first wheel a; and both this and the winding-wheel, or pinion, d, have their axes mounted in the plates of the clock-frame. The axis of the barrel and first wheel a, instead of being thus mounted, is attached to what may be termed a lever-frame, one side of which is seen in the cut at g, h, i, which is itself pivoted to the clock-plates at a, and to the end l of which the end of the line a, l, is attached, after passing under a running pulley attached to the weight W. e is an internal ratchet on the first wheel a, acted upon by the long click m, which has its opposite end attached to the lever-frame near its extremity. While the clock is going in the ordinary way the descent of W causes that part of the line marked l to turn the barrel in the direction of the arrow, carrying with it the first wheel a, the internal ratchet of which slips under, without being affected by, the click m. Under these circumstances the resistance of the weight W (through the line l), and the resistance of the pinion f, produce a certain pressure on the lever-frame at p, which causes the end i to assume a determinate position, in which it remains without motion so long as the weight continues to descend, and consequently to draw down the line l; but so soon as, by the operation of winding up the clock, the pressure upon f ceases to operate, the stress of the weight upon the portion of the line marked l causes the end i of the lever-frame to be depressed, and the click m, which is connected with it, to be thrust against the internal ratchet e, sufficient force to maintain the action of the first wheel a, which turns as it were in one piece with the lever-frame round the axis a, thereby producing a pressure upon the pinion f exactly corresponding, if the axis h corresponds with the point at which the strain of the line l is applied to the rope-barrel b, to the pressure which is exerted during the ordinary action of the machine.

The machinery connected with the Exchange clock for chiming upon a set of large bells in the turret was constructed by the same gentleman as the mechanism of the clock itself; but, owing to difficulties in the tuning of the bells, it is not yet (Nov. 1845) brought into action. These chimes will be the first constructed in this country to play tunes in
harmony, two or more notes being struck simultaneously upon different bells, whereas in most cases the melody is produced in single notes, without the introduction of chords, which not only requires the machinery to be more complex, but renders it necessary to adjust the bells into more perfect tunes than is necessary for ordinary chimes.

HORSE-RADISH. [Cochlearia Amoracia, P. C. S.]

HORSE-SHOE. [Horses, P. C. S.]

HOSPITALS. [Temples, P. C. S.]

HOTTONIA, a genus of plants belonging to the natural order Primulaceae. It has a 5-parted calyx, divided almost to the base, with the bilum, close to one end; the stamens, 5, inserted and included in the tube of the corolla; the capsules many-seeded and 5-valved, with 10 teeth. H. pauciis is the flowers whorled, stalked, and seated upon a long solitary cylindrical cuneo peduncle, the corolla longer than the calyx, the leaves pinnatid. It is a native of Great Britain in ponds and ditches, and is called the Water-Violet. The leaves are submersed and crowded; the flowers rising above the water are of a purple and yellow color. It is a pretty plant, but possesses no useful available properties. (Babington, Manual of British Botany.)

HOUBRACKEN, the name of two distinguished Dutch artists, father and son.

Arnold Houbraken, the father, was born of a good family at Dort, in 1660, and was the pupil of Samuel van Hoogstraten. He painted history and portrait, and executed many miniatures. He died suddenly at Amsterdam; and he visited this country and remained here eight or nine months, for the purpose of making drawings of some portraits by Vandyck, which were engraved by Van Gunst. Houbraken (1740) is the biographer of his father, for his account of the lives of Dutch painters, with portraits engraved by his son, in continuation of Van Mander—'Grootsch Schouburg der Nederlandse Kunstenschaffen en Skilderessen,' in three parts. The text and second parts were published at Amsterdam in 1718 and 1719, for the author; the third part was published in 1721 for his widow: Houbraken died in 1719.

Jacob Houbraken was an admirable engraver; in execution he has been somewhat surpassed; yet he is certainly one of the finest etchings in existence. The most beautiful specimens, however, of Houbraken's engravings are some of "The Heads of Illustrious Persons of Great Britain," published in London by the Knaptons in 1748; the excellence of some of these heads must be seen to be comprehended. Vertue was a good engraver, and executed a few of the heads in this collection; but his inferiority to Houbraken was so apparent that the addition of those heads, which are more in number than any other in this series, were not accepted. Some of the heads, however, which were engraved by Houbraken, though of the highest excellence as works of art, were not regarded as portraits; as, for instance, those of the Earl of Somers and Secretary Thurloe, which Wallis says are spurious. [Vertue, George, P. C. S.] The collection is notwithstanding of great historical interest. Houbraken engraved also a great number of portraits of distinguished Dutch characters. He died in 1780.

(Van Goell, Nieuwe Schouburg der Nederlandse Kunstschaffen, etc.; Waterlo, Dictionnaire des Arts, etc.; Huber, Manuel des Amateurs, etc.)

HOUSE. [Houses, P. C. S.] A general outline of the principal features in the construction of houses being given under Building, P. C. S., and in the various articles in P. C. S. and F. C. S. which are referred to under that head, the sole object of this article is to supply one of the articles of the series there pointed out, which, in consequence of an accident, was unavoidably omitted under its proper title, Floor.

In the name floor, the same restrictions applied, collectively, to all the apartments and passages in a house upon one and the same level, in which sense it is almost synonymous with story. In a more literal sense however the term is confined to what is called the lower horizontal side of such apartments, and the under surface of which either constitutes or supports the upper horizontal side, or ceiling, of the apartments of the story immediately beneath it. With respect to the horizontal support of the floor, the internal or partition walls should be made to bear their share of the weight and strain; and where, as in the case of shops, warehouses, and public build-
for the struts. In some cases solid pieces of wood cut to fit the intervals between the joists are used instead of diagonal, or, as it is sometimes called, herring-bone strutting; and, whatever be the form of strutting employed, it is usual in cases where the floor will have to bear great weight to make the struts approximate very slightly to the wedge-shaped form of the voussoirs of an arch, in which case the floor may, by the addition of iron ties passing through the joints, rather below the middle of their depth, be force up into a convex form, whereby its strength will be enormously increased. When a timber floor is carried near to a chimney or fire-place, a method of strutting employed, it is usual in cases where the brickwork, to prevent the risk of fire. In such a situation the carpenter has recourse to what is termed trimming, which may be understood from the subjoined ground-plan of part of a floor of joists, abutting against a wall in which is a fireplace with chimney-flues in the jambs. In this cut a, b are two of the ordinary joists, the ends of which are supported in the usual way upon wall-plates; b, c are two joists made somewhat thicker than the rest, on account of the extra strain thrown upon them, and called trimming-joists; c is a piece of timber called a trimmer or trimming-joint, the ends of which are formed into tusk-tenons, which pass completely through the trimming-joists, and are secured by keying or wedging in such a way as to prevent them from separating; and d, e, are the trimmed joists, or those which, being cut off short of the wall, have their ends supported by being framed into the trimmer. The stone slab in front of the fire-place is supported between the ight and trimming-joists by a flat brick arch, sometimes called a brick trimmer, turned between the wall on the side, and a piece of wood called a springing-piece, which answers the purpose of what engineers term a skew-back, attached to the trimmer, on the other side. When the direction of the joints is parallel to that of the wall in which the chimney is formed, the arrangement is of course somewhat different; one strong trimming-joint then takes the place of the trimmer c, and two short trimmers are put in the place of b, c.

The chief objections to the use of single flooring are, that the construction offers little obstruction to the transmission of sound from one story to another, and, for the sake of the ceiling, the joists must be made thin. Both of these defects may be in some measure overcome by the arrangement shown in Fig. 2, in which every third or fourth joist is made an inch or a half deeper than the rest, and a series of slight bars called ceiling-joists, of which is shown in the cut at d, is nailed, or notched and nailed, to these deeper joists, so as not to touch the intermediate joists, and to these the ceiling laths are nailed. By this arrangement the joists may be made of any required thickness, and the ceiling is in a great degree relieved from the injurious vibration of the floor: and the effect of the shrinkage of the joists, which would cause the ceiling to crack.

In a double, or more properly a double-framed floor, three sets or tiers of joists are used, of which the middle set, called binding-joists, or simply binders, form the real support. These reach from wall to wall, or from one primary point of support to another, at intervals which may vary according to circumstances, but are usually about six feet; and they are mounted, at right angles with their own direction, by a series of smaller joists, called bridging-joists, which may, if it be important to save depth, be notched on to them, and upon which the flooring-boards are laid. Beneath the binding-joists is a set of yet smaller ceiling-joists, similar to those in the construction illustrated by Fig. 2. If it be necessary to save depth in fixing these also, care must be taken not only to fit them to the thickness of the boards, but to fix them in such a way that the floor will have to bear great weight to make the struts approximate very slightly to the wedge-shaped form of the voussoirs of an arch, in which case the floor may, by the addition of iron ties passing through the joints, rather below the middle of their depth, be force up into a convex form, whereby its strength will be enormously increased.

![Fig. 1](image1)

![Fig. 2](image2)
easily remedied by the simple plan of laying a horizontal pole along the foot of the rack to support the lower ends of the floor. A new floor is a very essential both to appearance and comfort that the shrinkage of the boards after they are laid should be reduced to the lowest possible amount. On this account, also, narrow boards are preferable, for seven or eight不得 being extensively used. Sometimes much narrower pieces, formed by cutting planks into two or more widths, are employed, especially in superior houses, where a second planking of which the blank is laid over the principal floor over a kind of veneering or finish. An inch may be considered the least thickness which can be proper for flooring-boards, although, as shown under Batters, P. C., p. 45, inferior rooms are frequently laid with boards of which some are cut from a batten originally under three inches thick. Ingenious machinery has been contrived and extensively used for the sawing and planing of flooring-boards; but such machines are frequently objected to as causing a considerable waste of timber, by cutting away much more, in width as well as in thickness, than it is needful to do in dressing them by hand. Hebert (Engineer's and Mechanic's Encyclopedia, art. "Flooring") describes the machine invented by Mr. Muir, of Glasgow, and which has been brought into use in several extensive establishments, by which, while the simple planing of the surface may be perfectly performed, the edge is cut in a bevel at the same time, and, if required, to cut grooves in them for the purpose of tonguing the joints.

The operation of laying floors is by the operation termed folding, the floors thus laid being termed folded floors. In this operation one board is first laid down and secured firmly by nailing to the joists. Another is then laid down and fastened in like manner precisely parallel with it, but at such a distance from it as barely to leave room for two, three, four, or any other determinate number of intervening boards. When, therefore, these intervening boards are laid in the place provided for them, being rather too wide for the space, they buckle up in the form of an arch. Boards are then laid across them, and upon these boards two or three men jump until the flooring-boards are forced down flat to the joists, to which they are securely nailed. Another portion of the floor is then laid in the same manner.

The edges of the boards in a folded floor must of necessity be plain or square, and the boards must be nailed to the joists near both edges, in consequence of which it frequently happens that in shrinking they split or crack along the middle. In superior floors joints formed by ploughing and tonguing, or by rebating and lapping the adjoining edges, are often used. Reaping, or cutting off by nailing, is the only thing that prevents allowing for the movement consequent upon shrinkage, without impairing the air-tight character of the floor, which is not only important for comfort, but also as a check to the progress of decay. The floor is therefore dovetailed at one side only, the nails being driven in obliquely through the edge, so as not to show at all on the surface. Some workmen insert the dovetails over the joints only, and others only over the interjoints, but perhaps the best way is to put them sufficiently close to have one over every joint, and one over every interval or interjoint. The gauge for the dovetails should be run from the under surface of the board, which should be straightened for the purpose. Flooring-boards, when worked by hand, are generally left rough on the under surface, excepting for a short distance from each edge, the intervening portion being merely smoothed with an adze at the points where the board crosses the joists. The floor is then finished by driving in nails driven at a lesser distance. The object of forcing the boards of a floor laid otherwise than by folding up to one another as close as possible, some carpenters employ an ingenious and very efficient machine, named a flooring-cramp, invented by H. F. S. In this apparatus, the floor is divided into panels, and the whole is nailed down flat to the joists, as described in Hebert's work above referred to. It consists of a lever of what is termed the second class, in which the fulcrum is at the lower end and iron box made to slide and slide upon one of the joists, upon which it may be fixed at any desired point by driving a wedge. Being brought close to the edge of a fresh-laid board, the workman seizes a handle at the end of the beam, which, operating it towards the face of a pair of iron with great energy against the edge of the board, and makes the joint exceedingly close. In using either this cramp, or the cheaper substitute for it called a dog, it is well to lay a loose fillet between the cramp and the edge of the board, to preserve it from injury by the forms exerted. Any floor thus laid a plank at a time is said to be straight-jointed, as distinguished from a doubled floor.

The heading-joints, or those between the ends of the flooring-boards, are usually tongued, that is, fitted by making very close and tongued. In dwelled floors the heading-joints must be broken, or so arranged as not to come opposite to one another, and the same precaution is advisable in other floors also, though unnecessary. For this purpose, iron nails are driven in the rafters, or the ceiling joists, or in the sides of the chimney, to which the timbers are so united by means of iron, brick, and masonry, that occasioning any unpleasant draught in the rooms. It is always highly important, for the preservation of the timber, to do this in the case of floors laid in a basement story, which rest upon what are termed ground-joints laid upon brick or stone piers or dwarf walls; and in many of the best London houses it is also done for upper floors, the air-bricks being sometimes concealed by architraves or cornices, or other representations of such a machine, invented by Mr. Muir, of Glasgow, and which has been brought into use in several extensive establishments, by which, while the simple planing of the surface may be perfectly performed, the edge is cut in a bevel at the same time, and, if required, to cut grooves in them for the purpose of tonguing the joints.

Flooring is measured by the square of 100 square feet. Respecting the construction of floors with special reference to safety from fire something is said under Fire-Proof Buildings, p. 146. The plan of a floor is said to be air-tight, which it can only be by virtue of excellent workmanship and some peculiarity of construction, is a very important preservative against the spread of fire, and is also useful for enabling the builder to introduce a current of air among the timbers by means of iron air-bricks, without occasioning any unpleasant draught in the rooms. It is always highly important, for the preservation of the timber, to do this in the case of floors laid in a basement story, which rest upon what are termed ground-joints laid upon brick or stone piers or dwarf walls; and in many of the best London houses it is also done for upper floors, the air-bricks being sometimes concealed by architraves or cornices, or other representations of such a machine, invented by Mr. Muir, of Glasgow, and which has been brought into use in several extensive establishments, by which, while the simple planing of the surface may be perfectly performed, the edge is cut in a bevel at the same time, and, if required, to cut grooves in them for the purpose of tonguing the joints.

in out-buildings, floors or pavements of bricks and tiles are used. But bricks and tiles may be laid either in dry sand, in mortar, or in cement. The better kinds of brick pavement are laid with a peculiar kind of hard brick made for the purpose, and sometimes used also in masonry. In some cases, the stones are provided in boxes or papers. Flat brick pavement is very fragile, and is damp from the earth upon which it is laid; but brick-on-edge pavement is in some cases superior to stone, supposing the stone to be laid immediately upon the ground. When used for beer-cellar, pantries, dairies, or stables, brick-on-edge pavement laid in dry sand is convenient from the facility which it affords for the escape of fluids splinter upon it. Some paving bricks are concave in the center, and bear on the lower side flats, and this number, one inches to one and one half inches and a half one. A small hand clinked, called Dutch cenguins, is used almost exclusively for brick-on-edge herringbone pavements, in which the bricks of each course had now made him an angle of 45° to the direction of the course; and each course is inclined in the opposite direction to the adjoining one. Square paving tiles, laid in courses like stone pavements, make a very neat-looking but not very durable pavement. Brick-tile pavements admit of considerable variety and ornament in the colours and disposition of the component parts, especially in combination with the stone or tile flooring devices in several colours. [TILES AND PAVEMENTS, P. C. S.]

Floors of cement are occasionally used in fire-proof buildings, in which cases Mr. Richardens and Mr. Smellie have constructed and covered with the cement to form a level surface to receive the cement. This is occasionally done in private houses in preference to surround the vaulting with a wooden floor. In some places floors, even of considerable height, are not covered, but spread upon the ground. Floors of cement are very cheap, and in some degree fire-proof, but their surface is very apt to wear into holes. Floors of tempered earth, or of various compositional substances, are sometimes used for purposes of this kind. The floors in each other and bound together by mixing with cement, are also occasionally used in cottages and rural buildings, and may be made very hard. Floors of pavements of ashphalt are noticed under ASPHALT, P. C. S., p. 145. [Nicholson, Architectural Dictionary, arts. 'Floor,' 'Car- racee Flooring,' and 'Naked Flooring'; Encyclopaedia Britanniaca, art. 'Building in England'; Burckhardt's Egypt and Nubia, &c. &c. &c.]

HOUSE-BREAKING. [LAW, CRIMINAL, P. C. S.]

HOUSE-LEEK. [SEMISVYVUM, P. C. S.]

HOWELL, JAMES, the son of a clergyman in Wales, was born near Brecon, about the year 1696. He was educated at Jesus College, Oxford, where, in 1710, he took his bachelor's degree, but left the university. His father's family was numerous, and he had to shift for himself. Several men had, having set up a patent glass-manufactory in London, Howell was appointed to be their steward or manager; and in 1719 he undertook for his employers a tour on the continent, in the course of which he visited Holland, Flanders, France, Switzerland, and Germany, where, after he was elected a fellow of Jesus College. He next travelled as tutor to a young gentleman; after which he was sent to Madrid to negociate the purchase of a confiscated merchant. His skill and activity in business were remarked, and he was appointed by that nobleman's liege. In 1740 he entered Denmark as secretary to an extraordinary embassy; and on his return he continued to be for some time unemployed, visiting France and Italy, and was appointed by that nobleman's liege. In 1740 his diversified services were rewarded by an appointment to the clerkship of the council at Wittenberg; but the breaking out of the civil war soon made his place dangerous, and in no long time deprived him of it. In 1643 he was committed to the Fleet, where he was detained till after the king's death. He was pursuivant, and even in debt; but, with his characteristic veracity and spirit, he set about writing for the press, by which he contrived to maintain himself, both during his imprisonment and afterwards under the Protectorate. A little Flattery which he was at the same time convenient to administer to Cromwell, was forgiven at the Reformation, when the praise of historiographer royal was created as a means of providing for him. He retained this office till his death, which happened in November 1666. He was buried in the church of St. James. Howell's writings are very numerous. A few of them are in verse, the principal being his 'Doceana Groce,' or the Vocal Obscurites,' 1640. But his prose works alone deserve remembrance; and of these there are not a few which either were pamphlets of temporary interest or translations of historical pieces from the French and Italian, in the parts of which his name is preserved by the good sense, sagacity, and liveliness of his letters, which were the earliest collection of the kind published in our country. They were chiefly called 'Epistolas H.R.C.' familiar letters, domestic and foreign; partly historical, partly political, and partly philosophical.' The first volume appeared in 1645, the fourth and last in 1655, and they have since gone through many editions. [HUGHES, John, Bp. of Exeter, who was called the Dutch battle-painter, was born at Haarlem in 1646. He studied with Vandermeulen at Paris, and etched some of his designs. In 1708 or 1709 he was commissioned by Prince Eugene to paint the series of battles which he and the Duke of Marlborough had joined together. Huchtenburg himself made etchings of these battles in copper: they were published at the Hague in 1725. His pictures are much in the style of Wouwerman, and are scarcely inferior to the works of that master. He lived chiefly at the Hague, but died at Amsterdam in 1733. (Van Gool, Nieuw Schouburg, &c.)

HUDSON, THOMAS, was born in Devonshire in 1701. He came to London and became the pupil of Richardson the painter, and married his daughter. After the death of Jervas he joined with Reynolds as his assistant, and as a portrait painter in London, and, notwithstanding the rivalry of Vanloo and Liotard, he enjoyed the chief business in portrait painting until the return of his pupil Reynolds from Italy, and the group of three young men, who came to London in 1763, in innovation in portraiture, he gave up business and retired to his villa at Twickenham. Northcote describes an interview between Hudson and Reynolds in 1764, soon after the return of the latter from Italy, in which Choizet was present. Hudson called Reynolds to see a much-talked-of head of a boy with a Turkish head-dress—it was the portrait of the Italian boy Marchi, whom Reynolds had brought with him from Italy; 'perceiving,' says Northcote, 'no trace of his own manner left,' Hudson exclaimed, 'By God, Reynolds, you don't paint so well as when you left England!' Hudson himself had also just returned from Italy, and he visited him together with Roubilais. He entered Italy as Reynolds was leaving it, and the rising and setting stars of portraiture in England met on Mount Cenis in their passage over the Alps. There is little to be said of Hudson's style: he was of the Kneller school; he made fair transcriptions of his models, with little variety of posture, and not much more of costume. His master-piece is a portrait of Charles Duke of Marlborough, now, in the hall at Blenheim: many of his works were engraved in mezzotint by the younger John Faber. There is a portrait of Handel by Hudson in the Picture Gallery at St. James's Palace. Hudson was a most skilful and diligent composer ever sat for: there is a portrait by him of Archbishop Potter in the same collection. Hudson was rich and contented. He had at his villa at Twickenham a very extensive collection of cabinet pictures and drawings by great masters; many of the latter were purchased at the sale of Richardoun's excellent collection. He survived Richardson's daughter, and married Mrs. Fenners, a lady of fortune, and to her he bequested his villa. He died in January, 1779. (Walpole, Anecdotes of Painting, &c.; Northcote, Life of Sir Joshua Reynolds.)

HUGHES, JOHN, the son of a respectable citizen of London, was born in 1677, at the town of Marlborough, in Wiltshire. He was educated in London, chiefly at a dissenting academy, where Isaac Watts was one of his fellow-pupils. His natural turn for study was encouraged by the delicacy of his health, which made his friends well pleased to obtain for him a small income in the public service. He held a clerkship in the Ordnance-office, and was secretary to several commissions issued under the great seal for improving harbours. In 1717, too late to permit him to enjoy affluence long, he was appointed by Earl Cowper to be clerk to the commissions of inquiry into the state of the peace. He had, in 1707, been Cromwell's private secretary, when the peace of Ryswick was arranged, and in 1697, celebrated the peace of Ryswick, introduced him to the acquaintance of Addison, Pope, and other literary men, whose liking he was well qualified to secure by his good temper and want of pretensions. When Addison's critical friends, on reading the first four acts of
Cato,' had condemned it. Hughes dissected, and insisted on its being completed; and although the author afterwards completed it himself, yet Hughes was in the first instance intrusted with that task. Hughes wrote a tragedy called 'The Siege of Tenochtitlán,' and it is in several modern editions, and merits its place for the excellence it possesses in language and in lofty and refined feeling. It was acted for the first time on the 17th of February, 1760, and received such applause that night, that Mr. Hughes died of the heat he excited in his house. Hughes died on the 22nd of May, and was buried the next day. His contemporaries, and even his enemies, lament his loss. He was a man of great learning, and his name is associated with that of his master, Dr. Johnson. Hughes left behind him many works, of which the 'Tales of a Traveller' and 'A Delightful Conversation' are the best known. He was also the author of a book on chemistry, which was published posthumously.

HUMBOLDT, KARL WILHELM, BARON VON, one of the most distinguished linguists of his time, was born at Potsdam, on the 22nd of April, 1769. He was a man of great learning and a great range of knowledge. He was the son of a wealthy man, and was educated at the University of Göttingen. At the age of twenty, he published a work on the languages of the Indians of the Amazon, and was appointed to a professorship in the University of Göttingen. He was the author of many works on the languages of the South Sea Islands, and was a great authority on the languages of the American Indians. He was a great advocate for the study of the languages of the world, and was one of the first to urge the importance of the study of the languages of the non-Christian world. He was a great friend of the Abbé de l'Isle, and was one of the chief advocates of the establishment of the American College of the Indies at Buenos Aires. He was a great admirer of the work of the Abbé de l'Isle, and was one of the chief supporters of the American College of the Indies. He was also a great friend of the Abbé de l'Isle, and was one of the chief advocates of the establishment of the American College of the Indies at Buenos Aires. He was a great admirer of the work of the Abbé de l'Isle, and was one of the chief supporters of the American College of the Indies.
Cesar, Strabo, and other ancient writers. In the countries
invaded by the Romans, the complexity of the ancient
language was expressed by the Celtae, the Gallicans; and
the Tamarians. (Alcide) are said to have been
probably the same. The second volume also contains a
Mormon on the Limits within which Governments ought
to confine themselves in the care of the welfare of their
Subjects; A metrical German translation of the 1st, 12th,
and 14th of Finde's Olympic Odes; the 1st, 2nd, and
9th of the Thibyan Odes, among which No. 4 appeared
first, with a commentary, in the "Neue Deutsche Monats-
zeit."

Hone (1797); the 4th, 6th, and 9th of the Nemeen
Odes; Forty-one Sonnets printed from MS., &c. The
volume also contains the celebrated critical essay on Goethe's H. Hermann
and Dorothea (1868), which was first published
in the first volume of his "Aesthetische Versuche,"
Brunswik, 1826, 4to., and the memoir of dissident
Sexes on Organic Nature; Fifty-seven Sonnets, from

Berlin, 1828, 4to., is not in this collection. During
the last ten years, Humboldt was actively engaged in
inventing the Malay and American languages; but find-
ing the task above his strength, he abandoned the Ameri-
can languages to his friend Dr. Buschmann, for whom he
secured a position in the Natural History Library in
Berlin, and he devoted his time exclusively to the
Malay languages, on which he intended to write an ex-
tensive work. When he left for Mysore, his first volume was
nearly finished, and it was prepared for the press by Dr. Buschmann
and Alexander von Humboldt, who published it, with a preface of
his own, under the title, "Ueber die Kawi Sprache auf
der Malaiischen Inseln," Berlin, 1826, 8vo., which attracted the atten-
tion of all Europe. The greater portion of this work com-
prehends investigations of the progress of civilization from the
continents of India towards the large islands in the Indian
Sea, which he traces in the monuments, the languages, and
the literature of the different Malay nations; and only a
small portion is devoted to the examination of the Kawi
language. The death of the author is the cause of this im-
perfection; but the work will be thoroughly treated in a second
volume, the materials of which he collected, but left in such a state as to require
the labour of a perfect scholar before they can be published.

Hume, James Deacon, born 28th of April, 1774,
at Newington in the county of Surrey, was the son of Mr. James
Hume, sometime secretary and afterwards a commis-
ioner of the customs, and who was a nephew of Dr. Hume,
bishop of Salisbury. The subject of this notice was sent when very young to Westminster School, and in that establishment
resigned the post of mastership of Dr. Smith and Dr. Vincent
himself his whole of his school education.

In 1790, when at the age of sixteen, Mr. Hume was ap-
pointed to a clerkship in the Custom House, where he soon
became conscious of that energy of character which accom-
panied him through life, so that at an unusually early age
he was appointed to fill an office of much responsibility in the
department. It was a maxim with him, which he frequently
uttered, that a man should never content himself with per-
forming merely his own duty, but that he should at all times
show alacrity in assisting every one requiring assistance, and
in extending to the utmost of his ability the field of his use-
ful exertions. Notwithstanding the difficulties of his position,
Mr. Hume undoubtedly secured his own advancement in life,
and attained to his deservedly high reputation.

In 1796 Mr. Hume married. He had twelve children,
eight of whom (daughters) lived to be women, and seven,
with his widow, survived him. Shortly after his marriage he
fixed his residence in the country, where he lived for
considerable extent of land, and commenced practical far-
mer upon a large scale, not however neglecting his official
duties, but giving daily attendance at his office, for which
he was rewarded by a part of Noyes's estate, the proceeds
before day like, returning to it after dark. He was always
depthly interested in the science of agriculture in all its branches,
and frequently in after-life referred to his practical experience
as a farmer in support of those doctrines of political economy
of which he became a zealous and enlightened advocate. In
1822 he was induced to relinquish his rural pursuits and again
to take up his residence in London. By this time, his value
had come to be so highly appreciated by the government,
means of reports which it became his duty to prepare upon
subjects connected with the revenue; and in the following
year he was appointed to reduce into a simple code the
many hundreds of thousands of statutes of 1500, often
of each other, and not unfrequently unintelligible, which at
that time formed the 'intricate and labyrinthine chaos'
of our custom-house legislation. This work had become one of
necessity for the guidance as well of the government as of the
commercial world. To no other man could its importance
be intrusted with anything like the same propriety.
Three of the most valuable years of his life were devoted to
the task; and to the unremitting labour which he applied to
its accomplishment, his friends attributed that inwardly power which was visible in the latter years of his life, and which, in the pride of his soul, seemed to be more
sooner than with his originally excellent constitution was
to be expected. The labour of the task was intense. During its progress he allowed himself no relaxation, and
acquired the habit, which he kept up, of working twelve hours
out of the night from dinner to breakfast, and keeping the
hours of the night and in the morning. He had also an
turn for the public business, and by the laws by which he
influenced his direction, and in which at the acts prepared by
Mr. Hume introduced clearness, economy, and regularity. In
the eleven intelligible acts of parliament prepared under
Mr. Hume's direction, and passed in 1825, everything was pre-
served that it was desirable to retain, while all that had become
worthless in the many hundreds of repealed statutes was dis-
carded. So intricate and confused had the laws indeed been rendered by successive patch-work pieces of legislation, that
even those persons who had made it the study of their lives
were often at fault in its application, and the decisions of our
tribunals upon this branch was frequently contradictory.

So sensible were the ministers by whom this work was intru-
sted to Mr. Hume's ability with which it was per-
fected, that he was promoted in 1829, by the addition of the
sum of 3000l. over and above the salary of his office,
from the duties of which he had been relieved during the
period devoted to the task; and thereat, therefore, any
question of improved, having been decided by the marts
of the country without his opinion concerning it having
first been obtained. So frequent did these consultations become, that
a room was fitted up for his use in the office of the Board of
Trade; and at length, in July 1829, his services were
wholly transferred to that department, where an office was created
for him as Joint-Assistant Secretary. In the perfor-
mance of the important duties thus intrusted to him, Mr.
Hume used the same degree of zeal and intrepidity which
had marked his previous course, and which secured for him
the respect and confidence of the successive chiefs of the
department.

At the beginning of 1840 the inroads upon his health, caused
by a long life of unremitting labour, were so apparent, that
Mr. Hume's retirement from the public service became in
manner necessary. By this time he had completed forty-nine
years of active service, forty-four of those years having been
passed in situations of responsibility, and he was allowed to
retire on a pension of the same amount as the salary attached
to his office, which appears by a treasury minute presented
to parliament, in which was expressed their lordship's 'full
approval of his good and faithful services, accompanied by their
regret that the public service would be deprived of his retire-
manship.' Mr. Hume's whole of his school education,
attained to his deservedly high reputation.

In 1796 Mr. Hume married. He had twelve children,
eight of whom (daughters) lived to be women, and seven,
municated; and it is probable that at no time during his active career was he able to render more essential services to the best interests of commerce, than by the suggestions made by him after his nominal retirement, and especially by the evidence given by him before the Import Duties Committee of 1853, with which, having been frequently quoted in the condemnation by all parties in the House of Commons, has been brought forward to support measures of reform in our fiscal system proposed and carried in conformity with his recommendations.

After an illness of some weeks' duration, but from which no serious result was apprehended, Mr. Hume was seized with a stomachail, an atypical character, and two days thereafter died, on the 12th of January, 1842, in the sixty-eighth year of his age.

Although Mr. Hume may be almost said to have lived with the pen in his hand, he published but little, the object of his labours being for the most part confined to the preparation of official papers, which may, nevertheless, have exercised a greater influence upon society than could have followed from the publication of his opinions. He wrote several papers upon subjects connected with commerce, which appeared from time to time in the British and Foreign Review. One of these papers, on the timber trade and duties, may be said to have established his reputation. He is better known, however, as the author of a series of letters which, under the signature H. B. T., appeared first in the 'Morning Chronicle' and have since been collected, and more than once reprinted. These letters contain some of the most admirable and unanswerable arguments for various changes in our fiscal system, many of which have since been carried out, while others are evidently on the eve of adoption. Mr. Hume's style partook of the characteristics of his mind, which was vigorous and original.

In the private relations of life, Mr. Hume was remarkable for the most perfect sweetness of temper. With fewer of human weaknesses than are usually found to accompany even the more correct among us, he was ever indulgent to the failings of others; just in his dealings; true to his promises; with a largeness of generosity that, as such things are usually measured by his models, was witnessed by all; and by the most scrupulous delicacy towards those who were its objects. His attachments were strong and stable, and he was the object of the most earnest affection to all who enjoyed the privilege of his close acquaintance.

HUMIDITY is that property of a substance by which it communicates to a body in contact with it some of a liquid which it may have absorbed; and the term is commonly applied to the atmosphere when it is in a state to deposit moisture on bodies in it.

The humidity of the atmosphere is caused in a great measure by the evaporation of water from the seas, lakes, &c. of the earth; and the quantity of moisture with which a volume of air is capable of containing depends upon the temperature: when the latter is low at any part of the earth's surface, the air is dry, with moisture sufficient for holding any more, but the quantity of moisture in a given volume will then be small. If the temperature be increased, the air becomes thereby comparatively dry, acquires immediately the power of receiving more vapour, and the power increases with the temperature, so that, in a given volume of air, the quantity which consists with the state of saturation is also increased. Whatever be the quantity of vapour which constitutes the state of saturation, if the temperature be suddenly lowered, or if there be presented a body which has an affinity for water, a precipitation of the latter takes place, or water becomes absorbed in the body.

The temperature of the atmosphere over any place on the surface of the earth diminishes as the distance of the stratum of air from the surface increases: the power of the air to hold vapour diminishes accordingly; and it may be stated that the humidity of the atmosphere decreases from the surface of the earth upwards. The great dryness of the atmosphere near the summits of mountains has been frequently noticed by travellers, but the difference in the different strata is, from local influences, subject to many irregularities. The temperature of the lower strata of the atmosphere, as well as the latitudes of places on the earth increase, a given volume of air, when completely saturated, will contain less water as a station is farther from the equator; and the like may be said of the entire column of the atmosphere over a station. This may serve to account for the fact that, in general, the weather becomes fine when the mercury rises in the tube of a barometer; for then, by the increased density of the air, the clouds are made to ascend in the atmosphere to a region where, the dryness being great, they are readily dispersed. On the contrary, when the air is rarefied, the clouds descend; and arriving near the earth, they enter a region in which the atmosphere is at or near the state of saturation; and, consequently, the vapours are easily precipitated. But it does not follow, that at the present time the state of the mercury is a more certain prognostication of rainfall than its ascent is of fair weather; the ascent of the clouds in consequence of the increase of air pressure is not sufficient to be accompanied by their dispersion. From the affection produced by high winds, the upper regions of the atmosphere are often charged with aqueous vapour; and rain may then fall while the top of the column of mercury is above its mean height, and even while it is rising in the tube.

The atmosphere often becomes humid from the evaporation of liquids by artificial means. In establishments for brewing, dyeing, and the like processes, the vapours produced from liquids which are constantly in a state of ebullition rise in the atmosphere, and even render it opaque. The breathing of men and animals produces a watery vapour which renders the atmosphere moist. And in summer, when the thermometer is in a small apartment the humidity is sometimes so great that water flows down the walls. The leaves of plants also discharge, in the form of vapour, the water which is embittered by its roots, and in conservatories this effect is particularly sensible.

In order to determine the quantity of water which is contained in earth when completely saturated with rain, Dr. Dalton assumed the density of rain water to be 1.035, after it had fallen copiously during the preceding day, and exposed it to different degrees of heat. When it seemed to have about the same degree of moisture as soil at the depth of two inches from the surface to the top, and it was found that it had lost one-twelfth of its weight; and when it had lost two-ninths of its weight it seemed like the upper soil in summer. His conclusion is that a body of earth one foot in depth contains four inches of rain water when the temperature as indicated by the thermometer is 70° Fahr., and in depth of water, and that it may lose one-fourth or one-half of that quantity without becoming incapable of supporting vegetation.

The effects of humidity on the dimensions of bodies are various: when a watery vapour penetrates between the twisted fibres of cordage, which are vegetable materials, the cordage swells out transversely, and thus becomes shortened; while cords made of animal substances become relaxed by humidity and increase in length. Most salts absorb water, and thereby increase in weight.

HUMIFICA is, BY THE SEEDS of certain plants belonging to the syncarpous group of Polyptetalous Erumaceae. It has the following essential character: the calyx is 5 divisions; the petals alternate with the lobes of the calyx and equal to them; the statocytes are numerous, and exserted, and not be incapsulated. The androecion has 10 stamens, the petals, monadelphous; the anthers 2-celled, with a fleshy connective, extended beyond the 2 lobes; the ovary superior, usually surrounded by an auricular or toothed disk, 5-celled, with from 1 to 2 suspended ovals in each cell; the style simple, the stigma lobed; the fruit drupaceous, with 5 or fewer cells; the seed with a membranous integument, the embryo straight, oblong, lying, in fibrous ashlymen; the radicle superior. The plants belonging to the order are trees or shrubs abounding in a resinous juice, with alternate, simple, coriaceous ex stipitate leaves, and axillary corymb of flowers.

The affinities of this order are not well made out. In their albuminous fruits the slender embryo is free with styrea cea, as also in their balsamic wood. They resemble Meliaceae very much in habit and in their fruitcification, but the anthers and seeds of Humiriacaceae differ very much from those of Menie. The order is known under the name of Menieaceae; and whilst Lindley thinks that their real affinity is with Auran ticaceae; 'an affinity,' he observes, 'indicated by their inflorescence, the texture of their stamens, their disk, their winged petals, the quantity of moisture secreted: by the fruit belonging to this order, Humirium, Helierea, and Socloplegia.'

Humiria DC. (from Omnium, the Guyanese name of one of the species.) The 50 species joined into a tube, the alternate ones shortest, ciliated above, an annular 20 disked, the stigma 5 lobed, the fruit containing a 5-celled nut, the cells 2 seeded. One of the species, H. balansaeformis, is a tree forty
feet in height, with ovate oblong leaves half-clasping the stem. The flowers, produced on the upper part of the stem and sometimes more than one flower to a leaf, are white, longer than the leaves, the peduncles smooth as well as the petals. This tree is a native of Guyana and Cayenne. Its bark is thick, and abounds with a red balsamic fluid, which renders it valuable for medical purposes. The wood is very hard and although those of Holleria and Sacoglottis, yield resinous juices.

(Lindley, Natural System; Burnett, Outlines of Botany; Don, Garden's Dictionary.)

HUNGARY.

There are three of the name of Andrew, or Andreas, who deserve a short

Andrew I., the son of Prince Ladislaus the Bald, and the fourth king of the house of Arpad, reigned from 1046 till 1061. His successor, King Peter, in 1045, had offered Hungary as a duchy to the Emperor Henry III. of Germany; but on his death his son Charles, who was protracted war with the emperor, made a peace with him, in 1052, through which all feudal ties between Hungary and the empire were abolished. During the reign of this king the majority was conveyed upon the throne of Hungary, and Andrew succeeded in introducing the Christian religion throughout his kingdom. Andrew fell in battle with his brother Bela, who succeeded him on the throne.

Andrea I, the son of Ladislaus, was the son of King Bela III. : he succeeded his elder brother Emeric in 1205, and reigned till 1238. During his long reign Hungary was shaken by disturbances and civil and foreign wars, caused by the revolutions and ambitious character of Andrea, whose passions however were more violent than strong. Previous to his accession he waged war with his own brother Emeric, and raised a numerous army. They were encamped in sight of the camp of the nobles minded men, who knew that the partisans of Andrea followed him only through fear, went alone and unarmed, with only a white staff as the symbol of peace in his hand, to the camp of the rebels. When he was in sight of them, 'I shall see,' said he, with quiet dignity, 'whether you will shed royal blood.' None of them dared to stop him, and he thus surprised his brother Andrew in his own tent, and after having reproached him for his conduct, prevailed upon him to submit without making even an appeal to his followers. In this way Emeric carried Andrew from the midst of his own army, and kept him in prison till 1215. He finally appeared, and Andrew was brought before him, and appointed him guardian of his son Ladislaus, who was a minor. After Emeric's death, Andrea seized the royal authority and reigned in his own name for eight years, and then abdicated in 1205, so that Andrea became legally possessed of the supreme power which he had usurped. Andrea was a slave to his brilliant but ambitious queen Gertrud, a princess of Meranum, whose conduct became so unsatisfactory that the principal Hungarian nobles conspired against his life, and during the absence of Andrew in Galicia, in 1213, they surprised him and put an end to her. The conspirators were headed by the Magnate Banco, whom the queen had mortally offended; for in order to take revenge for a slight offence which she pretended to have received from Banco's wife, who was famed for her beauty, Andrea separated her and his brother Berthold to violate the person of this lady, and she afforded him an opportunity of effecting his purpose in the queen's own apartments in the royal palace. In 1217 Andrew undertook a crusade, and made himself conspicuous in Palestine through his gallant deeds, but his final success was trifling, and he returned in 1223: thence he was called 'Hierosolymitanus.' Andrea took an important part in the Byzantine affairs of his time. After the death of the Latin Emperor of Constantinople, Peter of Courtenay, in 1217, the crown of Greece was offered to Andrea, who however declined it, and, in 1218, made a treaty of alliance with Theodore Lascaris, the emperor of Constantinople, which he entered into in marriage to Andrea's eldest son Bela. When Andrea returned from Palestine, he found this prince at the head of an army of rebels, and his kingdom disturbed by a civil war. The power of the noble was so great that in the diet in 1222, which Andrea convoked immediately after his return, they forced him to abdicate and to place on the throne his son, called 'Golden Bull,' which has justly been compared with the English Magna Charta, and by which great privileges were given to the Hungarian nobles, while the royal authority was greatly restricted. This golden bull was the first constitutional law of the kingdom of Hungary and its appurtenances. During the following years Hungary continued to be shaken by civil factions, which the king was unable to quiet, since his natural abilities and his good will were not supported by sufficient steadiness of character. Andrew II. died in 1236, and was succeeded by his eldest son Bela IV.

Andrew III., the son of Prince Stephanus, who was the posthumous son of the woodman Andreas, succeeded King Ladislaus IV. in 1290. His short reign of ten years was signalized by civil disturbances and foreign wars. Andrew compelled Duke Albert of Austria to give up his claims upon the crown of the House of Babenberg, and by his marriage with the daughter of the Emperor, he secured the succession to his nephew the King of Naples, who founded his claim to the Hungarian crown upon his descent from Maria the sister of the last Babenberg. In the same year, Andrew III was the last king of the house of Arpad, the founder of the Hungarian kingdom: and his successor, the fortunate Charles Robert, was the first king of the House of Anjou, who reigned over Hungary during nearly a century.

(Mailath, Count of, Geschichte der Magyaren; Fray, Historia Regum Hugfallorum.)

HUNTINGTON, ROBERT, D.D., was born in February, 1836, at Deobrynt, in Gloucestershire, where his father, of the same name, was parish clergyman. After having received the rudiments of a classical education at the free school of Brixton and a commercial training at 1823 a professor of Morten College, Oxford; and, having taken his bachelor's degree in 1858, he was soon after elected to a fellowship in that college. He took his degree of Master of Arts in 1859, and, after completing himself with great success to the study of the Oriental languages, he was in 1870 appointed to the situation of chaplain to the English factory at Aleppo. This post he held for above eleven years during which time he visited Jerusalem, Galilee, Samaria, Cyprus in 1677, and Egypt in 1680, and again in 1681, besides making an unsuccessful attempt in 1678 to reach Palmyra. His return home was not uneventful: he and his family spent the Christmas time in Dublin; but, after first taking flight on the invasion of Ireland by the deposed king after the Revolution, and then returning to that country for a short time, he resigned in 1801, and once more came over to England. In August, 1802, he was presented by Sir Edward Turner to the rectory of Great Hanglebury in Essex; and while here he married a sister of Sir John Fowell, one of the justices of the King's Bench. He seems still, however, to have felt undootable object, he describes in some of his printed letters as a rustic solitude, where he was banished alike from books and friends, from the living and the dead. It was in 1687 some years after he refused the bishopric of Kilmore in Ireland, his aversion to that country gave way so far that in 1701 he consented to accept of that of Raphoe. But he died there on the 2nd of September in the same year, twelve days after his consecration.

The only literary performance that Bishop Huntington published was a short paper in the Philosophical Transactions (No. 161), entitled 'A Letter from Dublin concerning the Porphyry Pillars in Egypt.' The writer of his Life in the Biographia Britannica states that some of his observations are printed in Ray's Collection of curious Travels and Voyages, 2 vols. 8vo, 1667, but all which that work contains is the Letter on the Porphyry Pillars, which is in volume ii., pp. 149-155. At the end of the reprint is a notice extracted from the Journal des Savans (No. 36, A.D. 1692), of a letter from M. Corhey to the Abbé Néricault, intituled that book, "The Natural System," 1816, a work which was considered a valuable contribution to the science of botany.

HUN

In 1836, Robert Huntington, D.D., was born in Gloucestershire, England. He received a classical education at the Free School of Brixton and a commercial training at Morten College, Oxford. Huntington was elected to a fellowship in Oxford College, where he studied the Oriental languages and completed himself with great success. In 1870, he was appointed chaplain to the English factory at Aleppo, a position he held for over eleven years. During his time in Aleppo, Huntington visited various parts of the Middle East, including Jerusalem, Galilee, Samaria, Cyprus, and Egypt. He was presented by Sir Edward Turner to the rectory of Great Hanglebury in Essex and married a sister of Sir John Fowell, one of the justices of the King's Bench. After a brief period in Ireland, Huntington settled in England again, where he wrote a short paper in the Philosophical Transactions. The writer of his Life in the Biographia Britannica states that some of his observations are printed in Ray's Collection of curious Travels and Voyages.

Digitized by Google
he had just heard from Aleppo ' that some English gentle-
men, out of curiosity going to visit the ruins of Palmyra, had
found 400 marble columns, of a sort of porphyry, and also
observed some temples yet entire, with tombs, monuments,
Graeco-Roman inscriptions of all sorts, and which he hop-
ethe copies. This would probably be the earliest information
received by the English public of the successful accomplish-
ment of the first modern journey to Palmyra, which was
achieved by some gentlemen of the factory at Aleppo in 1691,
and of which a full account was given in the 'Philosophical
Transactions' for 1695. Ray's book may have been printed in
the latter part of 1692, though not published till May, 1693.
The first edition of which month the book was first printed.

Dr. Huntington is principally remembered for the numer-
orial Oriental manuscripts which he procured while in the East
and brought with him to this country. Besides those which
he purchased for Archbishop Marsh and Bishop Fell, he ob-
tained between six and seven hundred for himself, which are
now in the Bodleian Library, to which he first presented thirty-five of them, and then sold the rest in 1691 for the
small sum of 700l. Huntington, however, missed what was
the principal object of his search, the very important Syriac
version of the epistles of St. Ignatius, a large portion of which
was at length recovered in 1848 by Mr. Tattam from one of the
monasteries in Nisibis which was burnt in the course of his inquiries, and, having been deposited by
him in the British Museum, has been published in the present
year under the care of the Reverend W. Curteon, keeper of
the manuscripts at the British Museum. Several extracts in
Huntington's letters, which are addressed to the Archbishop
of Mount Sinai, contain inquiries about the MS. of St. Ignatius;
and other inquiries are made in his letters to the Patriarch of Antioch.

There is a Life of Bishop Huntington, in Latin, by Dr.
Thomas Smith, at the end of which are thirty-nine of his
Letters, all in Latin, published in 1804, at London, in 1704; and
he is the subject of an article in the 'Biographia Britannica.'

HURA, a genus of plants belonging to the natural order
Euphorbiaceae. It has noneconomic, amanitaceous flowers;
the stamens are united into a column; the pistillate flowers with
the style single, and the stigma with 12-18 rays, and the capsule
with 12-18 cocci. H. creptans is a tree abounding with
milky juice. It is a native of the West Indian Islands,
Mexico, and Guyana, where it is called 'Sandbox,' or 'Mon-
key's Dinner-Bell.' It has coriaceous, acuminate, entire or very
slightly toothed, stalked, smooth, coriaceous leaves, with simple
veins passing from the midrib to the margin, in a curbed
direction, within a quarter of an inch or so of eachother,
and connected by numerous oblique veins; large, ovate,
leafy, deciduous stipules, and petioles as long or rather longer
than the blade of the leaf; 2 glabrous leaves at the base of
this tree is a deepened umbilicate woody capsule, about
the size of a middling apple, with from 12-18 furrows which
separate it into segments; the furrows separate into 2
valves, and files asunder with great elasticity when dry and
fully ripe. The noise the fruit makes during the process of
the drying of the fruit has obtained for it the common names.
The juice of the dried pulp of the allied genus Rumicaria (P.
C. S.) is exceedingly acrid, and a small quantity touching
the eye will produce blindness. The seeds, like those of
Croton and Ricinus, contain an acrid oil which is a drastic
and dangerous poison.

(Lindley, Flora Medica; Burnett, Outlines of Botany.)

HURRAN, called also Hurrar and Adhari, is a country
with a large commercial town in the eastern part of Africa,
and situated between the Nile and the Athoh. The capital is
Ankober, the chief town of Shoa, and one of the most
productive countries in the world. The inhabitants are mostly
black people, and many of the principal inhabitants have houses of two stories. There are
said to be many mosques within the town, forty-four of which are the abodes of learned men.
The town is well supplied with water from the numerous springs in its vicinity. Close
to the town is a river called Sambii.

The inhabitants are rigid Mohammedans, and pay strict
attention to the fasts and ceremonies enjoined by that religion.
According to D'Abbadie there is a law in force which pro-
hibits any white man, that is, any Turk or European, from en-
tering the town of Shoa, and the country is divided into
three parts, called Hurri, or the sea-coast, Hurri, or the
interior, and Hurri, or the mountainous country. Each part
must be large, as the houses are said to be built very close
gether. The principal occupation of the people is that of
felling the soil, which for several miles around is highly culti-
vated, producing coffee, cotton, wheat, barley, and a vast
quantity of fruits and vegetables. The Aata (a small plant, the leaves
of which are said to possess an intoxicating quality, and o.
which the Arabs in Yemen, where it is also found, are ex-
ceedingly fond) must be of abundant. The ground is irrigated by artificial means from numerous springs. Coffee
is the most important article produced; at least 2000 baies are
annually exported to the sea-coast, to the port of Bur-
burah and Zeila, and thence to Arabia, where it is mixed
with that of Mocha, which is improved by it. It is said to
differ from that of Arabia, the fruit being a large flat berry.
A few families are occupied in manufacturing industry. There
are weavers, blacksmiths, and gold and silver smiths. The
lances made in Hurran are in very high estimation.

Hurrar may certainly be considered, for that country, a
great commercial town. Kaftans arrive there or depart at all
seasons. They are obtained in large quantities from the
Nile and the Athoh. The Arabs and the Europeans who have
traded at Shoa and Burburah and Zeila, which two last-mentioned places may be considered as the ports of Hurran. Three kaftans are
exported for Burburah between the months of October and
March, and 20 kihmah for Zeev or Zelat, consisting com-
Pletely of 2000 camels. They export coffee, jowari, ghee, ostrich feathers, gum, myrrh, and wax; the last-mentioned article is
considered to be the most valuable and is used as a presen-
tment for cooling the body; it is also mixed up with flour and
made up into cakes, which are said to be very palatable.
They export also to Burburah slaves, both male and female,
and receive in return blue and white coarse cloth, Indian
piece goods, European prints, silk, silk-thread, red cotton-
yarn, beets, zinc, copper-wire, frankincense, and some smaller
articles. There are also annually three kaftans to Zeila. The
Arabs are so particular about their kaftans and the other
exports are increased by some articles, as wheat, millet, beans, &c.

smaller kaftans depart almost every month to Shoa, except
during the rainy season. They chiefly export articles ob-
tained from Burburah and Zeila, especially blue cloth, red
cotton-yarn, &c., and receive in return slaves, mules, and
horses. Other kaftans trade between Hurran and Arusie and
Chercher, two towns or encampments of the Gallas, situated
west and south-west of Hurran; the articles of export and
import are imperfectly known.

The climate of Hurran is said to be similar to that of Shoa,
but not quite so cold. The language bears an affinity to the
Amarah, or Amhara, which is the mother tongue of the
definite character is used in writing. The ruler of Hurran has
the title of Emir, and the succession is hereditary. He is fre-
quently at war with the Abyssinians, who also separate into two
sections, the Southern and the Northern, the former
being better governed, but his kingdom is in check by a small force armed with
matchlocks, by which the Gallas have a great dread of fire-arms.

(Barker, Report on the probable Geographical Position of
Hurrar and Adhari, from the Narrative of a Traver-
ser, Account of the North-East Coast of Africa, in London
Geographical Journal, vol. xiv.; D'Abbadie, Letter: Rigby,
Remarks on the North-East Coast of Africa, in the Trans-
actions of the Bombay Geographical Society, vol. ii.)

HUSKISSON, WILLIAM, was born March 11, 1770,
at Birch Moreton Court, Worcestershire, where his father
occupied an extensive farm. The family had long been set-
ched in Shoa, or Abyssinia, the capital is Shoa, and the hab-
bour of Burburah. As the place has not been visited by Europeans, its true situation is not
known, and our information about it is derived from the ac-
counts of some natives of the adjacent countries.

According to these accounts, the town is so large that it
takes two hours to go round it at a quick pace. It is sur-
rounded by a stone wall about ten feet high and three feet thick, and kept in good repair. There
are five gates. The houses are generally built of stone and
whitewashed, with flat roofs. There are however some few
thatched. The climate is very hot, and mud
the inhabitants have houses of two stories. There are
said to be many mosques within the town, forty-four of which are the abodes of learned men.
The town is well supplied with water from the numerous springs in its vicinity. Close
to the town is a river called Sambii.

William Huskisson was sent to Paris, at the request of his maternal uncle, Ir.
Mr. Huskisson, and remained there. His Abroad. The principal inhabitants have houses of two stories. There are
said to be many mosques within the town, forty-four of which are the abodes of learned men.
The town is well supplied with water from the numerous springs in its vicinity. Close
to the town is a river called Sambii.
do 1789,' established in 1790. The object of this club was to secure the 'intellectual navigation' of France, with it led to the charge which was often brought against him of having been a member of the Jacobin Club. In August, 1790, he pronounced a 'Discours' at the 'Société de la Découverte,' which reached a large extent, which obtained for him the time considerable celebrity in the French capital. He withdrew from the 'Société' after the legislature had determined upon the issue of assignats. In the same year (1790) he became private secretary to Lord Gower (afterwards the Marquis of Stafford), who was then the English ambassador. A letter dated a few days after the attack on the Tuilleries on the 20th June, 1792, shows that Mr. Huskisson was acutely aware that the Revolution had undergone a change. After the events of the 10th of August, 1792, the English ambassador was recalled, and Mr. Huskisson returned with him to England. He continued to prove great interest under Mr. Dundas, and was soon distinguished by his talents for business. In the 'Biographical Memoirs,' attached to the edition of his 'Speeches,' it is stated that he was often called to the private councils of the First Lord of the Treasury, Lord George Greville (afterwards Earl Grey's) expedition to the West Indies. Towards the end of 1796 he was brought into parliament as member for Morpeth, by the Earl of Carlisle; but he did not speak as a speaker before February, 1798. On the retirement of Mr. Pitt he resigned his official situation. He was unsuccessful in procuring a seat at the general election in 1802, and did not appear again in Parliament until 1804, when he sat for Liskeyard. He was secretary of the Treasury under the administration formed by Mr. Pitt in 1804; and after the death of that minister, and during the Whig administration of 1806-1807, he was an active member of the Cabinet. He was re-elected for Liskeyard; and after the dissolution of Parliament in 1807 he sat for Harwich, and continued to do so until 1812. From 1812 to 1823 he represented Mr. Lord Chichester, in which neighbourhood he had, in 1801, purchased a small estate. From 1823 until his death he represented Liverpool. On the retirement of the Whigs from office in 1824, Mr. Huskisson resumed his former post as secretary of the Treasury. In 1807 he was strongly invited by the Duke of Richmond, then viceroy of Ireland, to become chief secretary; but his services could not at the time be dispensed with. He retired from the office in 1809, along with Mr. Canning, when the latter left the ministry on account of differences with Lord Castlereagh. He refused from motives of friendship and personal attachment to his colleague to ask the restoration of his own position on the exclusion from power; and it was not until Mr. Canning accepted the post of ambassador at Lisbon, that Mr. Huskisson again entered the public service. In August, 1814, he was appointed Chief Commissioner of Woods and Forests. In 1823 he became President of the Board of Trade, and Treasurer of the Navy. His predecessor had been a cabinet minister, and Mr. Huskisson considered that his position entitled him to the same distinction, and after some debates occasioned by the cabinet already consisting of a larger number than usual, he became one of its members. After the death of Mr. Canning, in 1827, Mr. Huskisson's influence in the House of Commons increased; and he continued to hold his cabinet post. In 1828 he was appointed secretary for the Colonies in Lord Goderich's cabinet; and he retained his post when this cabinet was broken up and the Duke of Wellington became the head of a new ministry. He had to defend himself for remaining in office after his friends in the former cabinet were excluded from power; and he did so on the ground that the measures to which he was more particularly pledged would be followed up by the then existing administration. On the 12th of May, 1828, the debate on the East Retford Disenfranchisement took an unexpected turn, and Mr. Huskisson was called upon to redeem a pledge which he had given in a former discussion on the question; and he was heard with respect by his colleagues. After the debate, at 2 A.M. he wrote a note, as a matter of delicacy and courtesy to the Duke of Wellington, the head of the cabinet, placing his resignation in his hands. Without any communication with Mr. Huskisson, the duke laid it before the king. In the correspondence which ensued it is evident that the Duke of Wellington was desirous of obtaining the services of Mr. Huskisson. He had once before voted against his ministerial colleagues, in opposing, in 1822, Lord Londonderry's resolutions for re- lying the agricultural interest. In the request of Lord Liver- pool, the prime minister, he remained firm. The nomination of Mr. Huskisson was followed by that of Lord Palmerston, Mr. Grant, and several others who had belonged to the Whig party. In both cases it became evident that the commercial principles were held by him in common with them, and in his general views he was approximating towards the Whig party. He had always been in favour of the Catholic claim, and in opposing the repeal of the Corporation and Test Acts, he did so on the ground of its being a partial measure, and likely to retard Catholic emancipation. He supported in May, 1829, Mr. Grant's bill for reining the year of their disabilities. He was known for having supported a measure of reform, and in the same session he had voted in favour of giving representatives to Manchester, Leeds, and Birmingham. In parliament Mr. Huskisson seldom spoke except upon financial or commercial subjects. He was an active member of the Bullion Committee, and defended the principles in the Report of that committee. He was one of the Committee of Inspection concerning the Depreciation of our Currency stated and examined,' which was published in 1810. In the debates on the corn laws, in 1814, he supported the system of protecting the agriculture by keeping the price of corn low, and that corn and manufactures were similarly protected, and that our whole system was one of artificial restraints. He was at that time merely for free trade in the abstract. He alluded to the possibility of imported corn becoming one-third, instead of one thirty-fifth of our consumption, if proper means were not taken to encourage the home culture. He was averse to the country being dependent on foreigners, and thought such a country was best provided with corn for the common use. He proposed a sliding scale of duties, according to which the duty would be 8s. 6d. when the average price of wheat per quarter was 68s., and as the price rose the duty would fall, so that at 80s. there would be no duty at all. Corn from the colonies he would have admitted at one-half the rates of foreign corn. The question was postponed to the following year; and he supported the corn-bill of 1815, and thought that less than 80s. as a protecting price would not remunerate the farmer. In the session of 1822 he moved a series of resolutions on the state of agriculture, one of which proposed that when wheat should be sold at 3s. 6d. a quarter the price of 15s. should be permanently charged on the importation of foreign wheat. The experience of the last twenty-five years does not prove the profundity of Mr. Huskisson's views on this subject. In 1827, when a new Corn-law was passed, he proposed that the corn-laws must be viewed in relation to the changes in the growth and price of corn abroad as well as at home; and he abandoned the corn-bill which had been brought in by the government, after the Duke of Wellington had carried an amendment the effect of which would have been to prohibit the release of bonded wheat so long as the price should be less than 68s. the quarter. In 1819 he was appointed a member of the Committee left the same. It is understood that he was principally concerned in drawing up the long Report of the Committee of Agriculture which sat in 1821. It advocated a relaxation of the corn-laws, for which he was never forgiven by the landed interest. In 1827 Mr. Wallace and Mr. Robinson (now Earl of Ripon) had taken some preliminary steps for relaxing restrictions on commerce; and there had been great hope that the movement would carry on a larger scale by Mr. Huskisson. In 1829 he carried through parliament an act for enabling the king in council to place the shipping of foreign states on the same footing with British ships, and to give to British ships in the ports of such states. He abandoned the old restrictive system of colonial trade, and, under certain regulations, threw open the commerce of the colonies to other countries. He assumed a great deal of operation in the search which had been imposed for the protection of the home produce. The shipowners, and the silk manufacturers, and a host of other interests were now in arms against him. They represented him as a cold and heartless theorist, and
he was attacked very generally, both in and out of parliament, for his departure from the ancient commercial policy of the country. His speeches in Parliament in defence of his measures are his best; and his expositions of the commercial consequences of the system always carried great interest. Sir H. Parnell (Lord ConLongton) has denied that Mr. Huskisson established free trade, but he states that in his speeches in 1825 he certainly proclaimed and proved the policy of this system, and that he was the best advocate of free trade in the House of Commons. He did not make the same mistake between the free-traders and the prohibitionists in taking a duty of 30 per cent. as the standard of resolution; and hints, that, had he thoroughly espoused the cause of free trade, he would not have thrown overboard the merchant principle of taking a duty. He had of making improvements in his plan of 1825. (Financial Reform, p. 75.) But even the reforms which he did affect excited great clamour to opposition; and the advantages of the changes he had effected were not recognised until some time afterwards. Mr. Huskisson was active in procuring the repeal of the combination laws; and he relaxed the restrictions on the exportation of machinery.

At the close of the session of 1828 Mr. Huskisson left London to be present at the opening of the Liverpool and Manchester Railway, on the 15th of September. When the train reached Parkside, near Newton, he got out of the carriage, and was immediately attacked by a Duke of Wellington, when an alarm was raised on the approach of an engineer on the other line. Mr. Huskisson attempted to regain his seat, but was prevented from doing so by the heat of the debate. He was dreadfully injured. He was conveyed to the house of the Rev. Mr. Blackburne, of Eccles, but the shock to the system was so great, that after enduring great suffering for a considerable time, he died at nine o'clock the same evening. At the request of a large and influential portion of the mercantile classes of Liverpool his remains were interred in the new cemetery, where a handsome monument with a statue was erected to his memory by his constituents.

Mr. Huskisson was married in 1799 to the youngest daughter of Admiral Milbanke, but had no family. On retiring the wealth in 1828 he entered upon the receipt of an income of six pensions of 3000l. a year, which the Crown was empowered to grant for public services. He was nominated for this pension by Lord Liverpool shortly before his political demise. He was for many years Agent for Ceylon, the saloon of which was increased from 800l. to 1200l. a year: he resigned this post when appointed to the Board of Trade in 1823. (Speeches of the Right Hon. W. Huskisson, with a Biographical Memoir, 3 vols. 8vo., London, 1831.)

HUTCHINSON. [THIRLSTED, F. C.] HUTTON, WILLIAM, was born at Derby, of poor parents, on 14th July, 1758. By fine internal integrity he raised himself to opulence and eminence. It has been said of him, that in many particulars of energy, perseverance, and prudence he deserves to be called the English Franklin. The speed of his progress was due to his own industry, and the work in the silk-mill at Derby, which occupation he quitted at seventeen, and was bound apprentice to an uncle at Nottingham, who was a stocking-maker. He ran away during his apprenticeship, and wandered as far as Birmingham, the town in which he subsequently acquired a fortune; but distress compelled him to return to his uncle. The poor remuneration which he obtained for his labours at the stocking-frame induced him to look anxiously towards some other means of gaining a livelihood; and in 1768 he bought an old worn-down press, and taught himself the art of bookbinding. In 1769 he went to London and began as a publisher and bookbinders' tools. In the same year he commenced attending Southwell, fourteen miles distant from Nottingham, on the market-day; and here he rented a shop at twenty shillings a year, and opened it for the sale of books. In his autobiography he says: 'During this rainy winter I set out at five every Saturday morning, carried a burden of from three pounds' weight to thirty, opened shop at ten, starved in it all day upon bread, cheese, and half a pint of ale, took from one to six shillings, shut up at four, and by trudging through the solitary night and the deep roads five hours more, I arrived at Nottingham by nine, where I always found a mess of milk porter, which was my dinner.' He had prepared by way of preparation for his industry; his uncle's sister was a woman of superior mind, and he owed much to her encouragement. His object was to save a small sum to enable him to commence business in a large town; and in 1769, after having twice visited Birmingham in order to see the chances of success which the place offered, he on the third visit took the lesser half of a small shop, at a rent of one shilling per week, and furnished it with a small supply of books. The overrears teased him for two years under the pretence that his shop was not large enough. He was so dejected that he applied to Mr. Toynbee, the well-known shopkeeper at Birmingham in that year, but after great difficulty he succeeded in recovering 880l. from the county. He now relinquished business in favour of his son. He had filled successively all the principal offices in the local society, and had been a member of the grammar school and the Along of Birmingham; and this was followed by other works in the following order: 'Journey to London,' 1784; 'The Court of Requests,' 1784; 'The Hundred Court,' 1785; 'History of Blackpool,' 1786; 'Battle of Bowbrook Field,' 1789; 'History of Derby,' 1790; 'The Barbers, a Poem,' 1798; 'Edgar and Efrida, a Poem,' 1798; 'The Roman Wall,' 1801; 'Remarks upon North Wales,' 1801; 'Tour to Scarborough,' 1808; 'Poems, chiefly Tales,' 1808; 'Trip to Coatham,' 1808.

Mr. Hutton died September 20th, 1815, a few days before the completion of his ninety-second year. In 1816 his daughter, Miss Hutton, published a Life of Mr. Huskisson, of Birmingham, and the History of his Family: Written by Himself.' This work is one of the most entertaining and instructive pieces of anecdote and reminiscence in the English language. The second edition of the work was published in 1841, in a series of Knight's English Miscellanies.' This edition contains some interesting notes by Catherine Hutton, Mr. Hutton's daughter, who was born in 1785. A list of the most important personal nature from Hutton's works are added as notes.

HYBRID PLANTS. [SEEDS OF PLANTS, F. C.] HYDATICA, a genus of fossil plants (probably aquatic) from the coal formation. (Arcts.)

HYDE, SIR NICHOLAS, was appointed chief justice of the King's Bench in 1626. He was the uncle and predecessor of the first Earl of Clarendon, whose mind he had great share in forming. Mr. Hyde's former commitment for the nonconformity of Sir Nicholas Hyde presided after his elevation to the bench was the one in which Eliot, Hollis, and Valentine were indicted for forcibly holding down in his chair the speaker of the House of Commons, and for conspiring to effect the exclusion of Prince Charles. The court refused to allow to the prisoners their Habens Corpus, and inflicted fines upon them of considerable amount. This conduct (Sir Nicholas Hyde's curious apology for which was that his interests were engaged by his nature) was detested by the court, and was indorsed by the long parliament a delay of justice. He died at his seat (Hinton Lodge), in the parish of Catherington, Hampshire, on the 25th August, 1651, aged 69.

Whitelock, his colleague on the bench, and political opponent, records that the cause of his death was a hot fever, rendered incalculable by reason of an imposthume breaking in his head; and that he died in his place of chief justice with great integrity and uprightness, and with great wisdom of temper, considering the ticklishness of the times.' (Rushworth, vol. ii. p. 111.) Four of his letters are extant in the Bodleian Library. A very proposition of this group, and is much quoted in the controversy, exists in the obsolete parish church of Catherington, Hants. He was succeeded in his estate by his son, LAWRENCE HYDE, who became principally remarkable for the personal share which he had in furthering the escape of Charles II. after the battle of Worcester. The king in his memorable wanderings was concealed for a night at the house of one of Mr. Hyde's tenants. But as this tenant was too fat-headed a rustic to be intimately instructed with the secret of his guest's quality, the king was accordingly passed off as a roundhead, and was in that character compelled to drink what must then have appeared hopeless success to the royal cause. After several days Mr. Hyde's house at Fenton, the house of Lord Southampton and Mr. Hyde, and by them safely conducted the next day to Shoreham, where they succeeded in procuring a passage for him to Fécamp. The circumstances are told in detail in a manuscript written by Mr
The tension or elasticity of watery vapour corresponding to every degree of Fahrenheit's thermometer, from zero to the point of boiling water (measured by the height in inches of the column of mercury which the vapour will support when the density of the atmosphere is represented by 30 inches), has been determined by Dr. Dalton for the purpose introduced a small quantity of water into the vacuum of a barometer, and observed how much, at different temperatures, the vapour arising from it depressed the column of mercury; and a table of the tensions is published in the fifth volume of the 'Manchester Memoirs.'

Previously to stating the manner of determining the relation between the intensity of an hygrometer, and orræææ, a cavity, a genus of plants belonging to the natural order Umbelliferae, and the sub-ord. Order Dehespermeae. It has the tube of the calyx rather compressed, the limb with an obsolete margin, the petals ovate, entire, acute, with a straight apex; the fruit flatly compressed from the sides; the carpels without vitre; the 5 ribs or nerves nearly siliferm, the carinal and lateral ones unusually obsolete, and the two intermediate ones joined. The species of this genus are generally bog-horsetails, but few of them are under-shrubs. The umbel is single, surrounded by a few-leaved involucrum. The flowers sessile or pedicellate, white.

Of the large number of species of this genus few if any are used in the arts or medicine, and none of them are sufficiently ornamental to lead to their cultivation. H. Azutica is said to be used in India as a diuretic and occasionally as a culinary vegetable. H. umbellata is recommended by Martius as a diuretic. It is said to be not infrequent in certain parts of the United States. The fresh juice acts as an emetic. It is said to possess an aromatic odour and an agreeable taste. The species of Hydrocoryne are easily cultivated; they must all be kept under glass and should be grown in pots placed in pots of water. (Don, Gardener's Dictionary; Burnett, Outlines; Babington Memoirs.)

HYDROCACYANIC ACID. [Fumaric Acid, P. C. S.]

HYDROSTATIC BED. [Bedford, P. C. S.]

HYGROMETRY is that part of natural philosophy which relates to the determination of the quantities of bodies, particularly of the atmosphere: it comprehends also the theory of the instruments which have been invented for the purpose of ascertaining the quantity of water contained in a given volume of air.

The experiments of Dr. Dalton have proved that the water received from the earth is not dissolved in the atmosphere, and that it exists there in the form of vapour. That philosopher discovered also that the quantity of vapour contained in a portion of the atmosphere depends greatly upon the temperature of the latter, and that it is very variable even when the temperature is constant. He ascertained moreover that when a quantity of aqueous vapour at a given temperature is diffused through any space, it will support the same external pressure, whether previously that space had been void or occupied by air. On these principles are founded the methods which have been suggested for obtaining the quantity of moisture in a given volume of air by means of the hygrometer: the requisite data being the elasticities of aqueous vapour at different temperatures, and the corresponding indications of the instrument.
the maximum tension at their respective temperatures: this supposition is not quite correct; but it may be presumed that, in using Biot's table for temperatures differing from 50° (Fahr.), the error in the tensions will not be considerable.

Gay Lussac having proved that vapours, whether those of pure water or such as consist of different kinds intermixed, while they retain their character of elasticity, suffer the same variations of pressure as are suffered by permanent elastic fibres, determined, by subsequent experiments, the volumes of the vapour produced by a given weight of water at given temperatures and under given atmospheric pressures. If a known quantity of moisture is in a given volume of vapour. The results of his experiments were reduced to a formula by Biot; and subsequently, with certain modifications, to one in English weights and measures by Dr. Anderson, the writer of the article on Hygrometry in the 'Edinburgh Encyclopaedia.' This formula is:

\[
G = \frac{447.4 \times 10^5}{F + E} + P
\]

in which \(G\) is, in grains, the quantity of moisture in a cubic inch of vapour at the temperature represented by \(F\) (Fahrenheit's scale), \(E\) is the elastic force of the vapour at the same temperature, and \(P\) is the height of the baromterical column in inches at the time of the experiment. It agrees nearly with that which was obtained by Dalton from experiments on the state of the thermometer at the dew-point [HUMORES, P. C.], the height of the mercurial column in that result being 30 inches. From this formula, the temperature \(F\) between 30 inches and 31 inches at a pressure of 0.376 atmospheres (Dalton's table of the elastic force of vapour corresponding to that temperature and that density of the air), we have \(G = 0.002477\), the grains of moisture in a cubic inch of the vapour.

The value of \(G\) being thus found for any given states of the barometer and thermometer; the weight of moisture, in grains, in a cubic inch of air of the like density and temperature, and consequently to any observed degree of dryness, Sausseur's hygrometer may be obtained on multiplying that value by the number in Biot's table corresponding to the observed degree and dividing it by 100; this division must be made because, in that table, 100 represents the elasticity of the vapour when in the state of complete saturation.

The extreme points on the scale of an hygrometer acting by the elongation of a material, like those of Sausseur and De Luc, may be found in the following manner: the instrument is to be placed under a receiver in which is a certain quantity of dry caustic alkali; when, after a time, the material will contract in length as much as its nature will permit; the point on the scale at which the index stands is that of extreme dryness, and constitutes the zero point. The instrument may then be placed in water, or in a receiver filled with vapour corresponding to 40 degrees of dryness; the material will expand to the greatest extent possible: the place of the index is then to be considered as the point of extreme humidity, and is usually indicated by 100.

The instrument consists of a glass tube bent so as to form two equal branches parallel to one another, and each terminating with a hollow ball in which is introduced sulphuric acid, coloured. One of the balls is covered with cambric, which is kept constantly moist by water from a neighbouring vessel; and the evaporation of the water, by cooling that ball, allows the air in the other, by its superior elasticity, to depress the acid in the tube below and force it to rise in the other. The degree of evaporation depends partly on the temperature, and partly on the state of the surrounding atmosphere with respect to humidity; and hence the depression of the acid in the tube, being measured by a convenient scale, affords an indication of the relative dryness of the air. In order to determine the absolute quantity of moisture in a given volume of the atmosphere by the state of his hygrometer, Leslie, having found from some experiments of the kind, that for a given degree of temperature and such of water, and having ascertained that the quantity of caloric necessary to convert a given volume of water into vapour was expressed by 6000 degrees of his instrument; concluded that the same quantity of caloric would raise an equal volume of air to a temperature expressed by \(F \times 4000\), or 16,000 degrees of the instrument; and consequently that, at the temperature of the water, the cubic air contains a quantity of moisture equal to \(\frac{4000}{F}\) part of its weight for each degree; the scale between the points of extreme dryness and extreme moisture being divided into one thousand parts. (Treatise on the Relations of Air to Heat and Moisture.)

From the fact that the elastic forces of pure vapour and of vapours mixed with atmospheric air are equal to one another, and from the expansion of each in consequence of being saturated with moisture may be found.

For if \(V\) represent a given volume of dry air, \(V'\) the volume, when saturated, and \(B\), in inches, the height of the baromterical column; then the elastic force of the air under the increased volume \(V'\) is \(\frac{V}{V'B}\). Now \(F\) representing the elastic force of the vapour in inches of mercury, which, for the given temperature, may be found from Dalton's table; the sum of the elastic forces of the air and the vapour will be expressed by \(F + \frac{V}{V'B}\); and this being made equal to \(B\), the pressure of the atmosphere, the value of \(V' - V\) may be found. Making \(V = 1\), that value expresses the expansion in a fractional part of the volume of dry air.

At any place on the surface of the earth, the mean temperature at which moisture begins to form in the atmosphere may be found from Dalton's formula \(E = M (F - F')\), in which \(E\) is the number of grains evaporated in one minute from a given volume of water in a cylinder 1 inch in diameter and one inch deep, \(F\) is the elastic force of vapour in the atmosphere at a given temperature, which may be the mean temperature at the place (50° Fahr., for Great Britain), and \(F'\) the elastic force of the moisture begins to form: \(M\) is, in grains, the evaporating force in an atmosphere supposed to be perfectly dry; and Dalton's table gives a table of such forces for different temperatures, the atmosphere being at rest, in gentle, and in violent motion. In the table, the temperature being 121°, the height of the baromterical column 30 inches, and the wind blowing moderately, the value of \(M\) is 154; and substituting this value in the formula, we have \(F' = F - E\).

The mean annual evaporation in Great Britain is 0000456 inches or 01155 grains per minute: this last number being multiplied by the contents of a circle 6 inches in diameter gives 0.2820 grains per minute (= E) from a vessel of that magnitude; hence \(F' = F - 0.0647\). But, by Dalton's table, the elastic force \((F')\) of vapour at a temperature equal to 50° is expressed by 0.376, in inches of mercury; hence \(F = 3.103\) inches. Substituting in the above formula for \(G\) this value of \(F'\) in place of \(F\), and 30 inches for \(B\), we get 0.0203 for the number of grains of moisture in a cubic inch of air corresponding to the depression of temperature 4° in the elasticity \(F\) is found to respond the temperature 44° 16' which may be found by inspection in a table formed to contain the values of \(G\) for different degrees of temperature.

HYMENOSPERMAE, from Hymen, in reference to its twin leaves), a genus of plants belonging to the natural order Leguminosae. It has a calyx furnished with two bracts at the base; the tube tubinate, coriaceous; the limb 4-5 parted, deciduous. The lobes sometimes reflexed, and prominent at the base nearly equal, glabular; 10 stamens distinct, inserted in the middle; the style filiform; the legume woody, oblong, many-seeded, containing fuscous; the embryo straight. The species are trees, with bifoliate leaves, and corymbs of white or yellow flowers.

H. Courbarli, Locust-tree, or Guan-Anine Tree, has oblong ovate leaves, unequal-sided, and unequal at the base, ending in a long point; with the legume oblong, compressed, yellowish, shining. It is a fine lofty spreading tree, and grows in the tropical parts of America and in Jamaica. The seeds are enveloped in a cellular mealy aril, and are covered, as it were, like honey, and is eaten by the Indians with great avidity. When fresh it is slightly purgative, but by keeping it loses this property. A decoction of this substance, when allowed to ferment, forms an intoxicating drink resembling beer. From between the principal roots of this tree there exudes a fine transparent resin, with a red or yellowish red colour, and which is collected in large lumps and sold under the name of Guan Anine or Guan Annni. This resin resembles amber, is very hard, and sometimes contains leaves, insects, or other objects imbedded in it, which remain in a perfect state of preservation. It burns readily, emitting a very fragrant smell. (Dioscore) The smooth surface of which has a kind of varnish. According to Lindley, this resin is called Jasatyly, Jatschy, or Capol, and in Minas Gerais Jacoba. Courbarli is the name of the tree in some parts of South America. In countries where this tree grows the resin is
used medicinally, and has also been employed in that way in Europe. It acts as a stimulant when taken internally, and as an irritant when applied externally. In fumigation it has been employed for persons labouring under asthma and dyspnoea. Dissolved in spirits of wine or oil it is used as an embrocation in rheumatism. Internally, it has been used as a substitute for guaiacum, in venereal disease and chronic rheumatism. The inner bark, either in the form of tincture or decoction, is administered as a vermifuge. The cudnones have a method of mixing it with sugar and rum, so as to make a very agreeable emulsion or syrup. The wild bees are fond of building their nests in the trunk of this tree. The timber of the old trees is very hard and tough, and is in great request for wheelwork, and for other purposes for which it is durable. The wood is so heavy that a cubic foot is said to weigh a hundred pounds; it takes a fine polish.

Several other species of Hymenocera are described, but of these comparatively little is known. (Don. Gard. Dict.; Lindley, Flora Med.)

HYMENOMYCETES, the first suborder of the Fungi, a natural order of plants. [Fries, P. C] They are characterized by their reproductive organs, called the hymenium, being naked. This suborder is divided by Fries into four tribes (Fungi, P. C.); by Berkeley into six tribes. Those of the latter are, Pileata, Clavata, Clavati, Mitrata, Copulata, Tremellata, and Sclerotiaceae.

The tribe Pileata contain the following British genera:—

Agaricus, in which the hymenium consists of plates radiating from a common centre, with shorter ones in the interior, composed of a double closely connected membrane, more or less distinct from the pileus: the veil is usually absent.

Agaricus, P. C.

Camellaria has a pileus furnished below with dichotomous, radiating, branched, subparallel folds, not separable from the flesh, sometimes anatomizing or obelose.

Merulius has the hymenium velvety, or simoon-pileata; the folds not distinct from the flesh of the pileus, bearing unequal angular or flexuous pores. [Merulius, P. C.]

Schizophyllum has the gills radiating from the base, composed of a folded membrane, which is ruptured along their edge; the two portions of the fold being revolute, bearing saci only on the outer surface.

Donkey has the hymenium composed of anatomizing gills, or flexuous elongated pores formed out of the curled substance of the pileus.

Pseudoper has the hymenium concrete, with the substance of the pileus consisting of subrouted pores with their simple discings.

Boletus has the hymenium distinct from the substance of the pileus, consisting of cylindrical separable tubes, with oblong spordia. [Boletus, P. C.]

Piptoporus has the hymenium formed of a distinct substance but concrete with the fibres of the pileus; the tubes at first wart-like, somewhat remote, closed, radiate-fimbriate, at length appearing elongated, open at the top.

Hydnum has the hymenium of the same substance as the pileus, composed of free spine-like processes.

Sistotrema has the hymenium somewhat distinct from the pileus, but composed of irregularly-disposed, curved, and gyroce lamellate teeth.

Irpes has the hymenium concrete with the substance of the pileus, torn into distinct spines, disposed in rows or in a reticulate manner, their bases connected together by lamellate sinuous, or porous folds; the saci slender, situated only on the toothed processes.

Radius has the hymenium tuberculated; the tubercles spreading, resin-bright, papillate or rude somewhat angular spines, more or less obtuse, distinct, distant or irregularly fasciculate, the inner substance homogeneous with the receptacle; the saci occupying indifferently all parts of the hymenium.

Pholas has the hymenium homogeneous and concrete, with the pileus smooth, venoso-rugose, wrinkles interrupted, disposed irregularly, straight or flexuous, bearing all over.

Thelephora has the hymenium homogeneous and concrete with the pileus, even or papillate, the whole surface bearing as.

Of these genera Agaricus contains by far the greatest number of species. On this account it has been found necessary to class the species under various subgenera. The following table contains the subgenera of Fries arranged in eight series. —

P. C. S.: No. 94.

Coprinus.
Coprinus.

Most of the species included under the series Leucocepsorus are notable, and contain those species which are mentioned as edible in the article Agaricus, P. C. It also contains the various species of Amanita, which are among the largest and most remarkable forms of the fungi. A. caesarea is remarkable for its beauty, but not so much so as for the traditional belief that it was in a dish of these mushrooms, which were regarded by the Romans as one of the greatest luxuries of the table, that Agrippina administered poison to her husband Claudius Caesar, in order to hasten her son's accession to the Imperial power. A. muscaria possesses an intoxicating or narcotic property. It is used by the inhabitants of the north-eastern parts of Asia in the same manner as wine, brandy, arrack, spruce, &c. are by other nations. One large or two small fungi is a common dose to produce a pleasing intoxication for the whole of the day.

Of all the species of the genus Agaricus have been described; of these 533 are natives of the British Islands.

Eight species of the genus Cantharellus inhabit Great Britain. The C. aurantiacus is said to be a poisonous plant. It is common in fit-woods and pastures. It has a beautiful orange colour and a strong smell. C. cibarius, the common Chanterelle, is common in woods in the summer and autumn. The pileus is of a pale yellow colour, and the whole plant has an agreeable smell like that of aspicts. On the continent of Europe this fungus is eaten, but is not often used in Great Britain. It is however dangerous when eaten raw, and should always be cooked. They form a delicious ingredient in rich gravies.

One of the species of Merulius has been supposed to be the cause of dry-rot. [Dry-Rot, P. C.; Merulius, P. C.] Berkeley describes five species of this genus as natives of Great Britain.

Of Schizophyllum but one species has been found in Great Britain, the S. commune. It is a very beautiful fungus, and has been found in almost every part of the world.

This genus Dendron has been so named from the remarkable sinuosities and sculpture-like pores of its hymenium. D. quercina is found commonly on oak-trees or stumps and stumps of that wood, it is a straggling and has been applied to wounds to arrest hemorrhage. It is commonly called the 'lungs of the oak,' and was formerly on this account used as a remedy in phthisis. It is at the present day sold in Covent Garden market for that purpose. There are other species of this genus which are indigenous in Great Britain.
**D. nivoseus** is a northern plant. It yields an agreeable perfume.

Upwards of forty species of the genus *Polyergus* are found in Great Britain, and many more European species have been described. Many of the species are used in arts and medicin(e). *P. ignarius* has long been famed as a styptic. Amadou, or German tinder, is made from this plant by separating the porous hymenium from the harder parts and steeping it in a solution of nitre after it has been beaten into a soft, spongy state. Many other species of *Polyergus* may be used for the same purpose. The Laplanders also use them for applying to actual cauteries in the same way as the Japanese and Chinese use the smoke of sandalwood. When the teeth are sore in the limbs, they pull the fungus in pieces and placing it on the skin, set fire to it and allow it to burn away till it blister; thus, as it is a counter-irritant, *P. officinalis* is a cathartic. *P. suaveolens* has a pleasant smell. Some of the species secrete acids, and boletic, fungic, and oxalic acids have been obtained from them. *P. squamosus* is one of the largest of British fungi, weighing sometimes as much as thirty pounds. *P. destructus* is one of the fungi found on decaying timber when it is attacked with what is called dry-rot.

Many of the plants formerly included under the genus *Boletus* are now referred to *Polyporus*. Berkeley enumerated sixteen species of the genus *Boletus* as natives of Great Britain. [*Boletus*, P. C. T.]

The genus *Hydnellum*, although named after *Stropharia*, the true boletus of the Pacific coast, is a series of plants. The hymenium is formed of spores which give to the species of this genus a very formidable appearance. Hence they are called in the country of the spine stalks, prickle-stools, &c. Several species are found in Great Britain, but some caution should be used in their selection. De Candolle says that those which have a dark colour are dangerous.

The genus * Fistulinus* has one representative in Great Britain, *Fistulina hepatica*. The pipe-stem of the forest. It grows upon the trunks of oaks and other trees. It is eaten in France. When cut into it is beautifully marbleied with red and white streaks resembling a fine piece of beef. It is called in France *Pêse de Chasse*, or *Chasseur de Bois*, Glout de Chasse. It is as an astringent taste, but is rather tough. It has been known sometimes to attain the weight of thirty pounds.

The genus *Stictotrema*, *Trepis*, *Radulium*, and *Philbia* are small genera, and not used as food, or in any way. *Thelephora* is an extensive genus, and forty-two species are indigenous in Great Britain. They are common on decaying branches of trees, &c., and exhibit a variety of colours.

The tribe *Clomatiaceae*, which are distinguished by a single or branched vertical receptacle, embrace the following British genera: — *Clavaria*, *Cenocoma*, *Geoglossus*, *Spalthularia*, *Mictrea*, *Typhula*, and *Phallaria*. These plants, in their trunks and club-shaped forms, begin in the soft wood, and are actually placed by the older naturalists in the same class. Some of the species of the *Clomatiaceae* are edible. All the genera as a class, are of a good, very strong, fibrous, and agreeable flavour like that of the common mushroom. *C. flavida* and *C. pygida* are prized on account of their taste. *C. cinerea* is the species most commonly eaten on the Continent.

The *Mitrula* have a bulbus, fimbriate, margined receptacle. They embrace five British genera: *Morchella*, *Helcogala*, *Vasco*, *Leotia*, and *Vibrissa*. The genus *Morchella* yields the esculent fungus morel. [*Morchella*, P. C. T. These species are found in Great Britain. There are also three British species of Helvelia as that genus is at present defined. The species of Helvelia are edible.

*H. crispata* is considered the best species for eating, but none of the British or French, are poisonous.

The tribe *Cupulatae*, which has a patelliform margined receptacle with a superior hymenium, contains the following British genera: — *Pestia*, *Patulatia*, *Asclepia*, *Bolbus*, *Dianella*, *Senecio*, *Sticthelis*. Of these *Pestia* is the most extensive genus, containing upwards of 300 species, of which 106 are natives of Great Britain. Some of these plants are very remarkable from the form of the spores, as they are smaller than the spores of any other plant. *P. coccinea* is perhaps the most elegant plant belonging to the natural order of Fungi. The outer surface of the cup which it forms is white and downy, whilst the inside is of a deep purple. It frequently grows on stichs, and is mixed with moss, the green colour of which forms a beautiful contrast with the white and crimson of the Pestia. *P. arvigozus* has a deep green colour, and possesses the property of staining wool on which it grows of the same colour as itself.

The *Pezizaceae* are not generally eaten, but none of them are poisonous.

The fifth and sixth tribes of the Hymenomycetæ are the *Tremellini* and *Sclerotiniaceae*. The *Tremellini* embrace six British genera. The *Sclerotiniaceae* are included under *Sclerotium* and *Cytosporaceae*. These are amongst the lowest forms of the Hymenomycetæ, and include species which are found decaying the various vegetable products producing the disease called ergot. [*Ergot*, P. C. S.; *Spermophila*, P. C. E. A. C.]*

Ex. The remaining forms of the Fungi are given under *Gasteromycetaceae*, P. C. S.

[Burnes, _Gastromycetes_, _English Flora_, vol. v.; Fries, _Systema Mycologicum_.]

**HYNDFORD, JOHN CARMICHAEL, third EARL OF A SCOTTISH PEER.**

The representation of one of the Sixteen Peers, the Scottish nobility in several parliaments, acted for two successive years (1739, 1740) as royal Commissioner to the General Assembly of the Church of Scotland, and held the dignity of lord lieutenant of the county of Lanark, in the upper district of which the family estates were situated. His diplomatic life began upon the occasion of the seizure of Silesia by Frederick the Great in 1741, when his lordship was deputed envoy extraordinary and plenipotentiary to the Prussian court. In this mission he succeeded in effecting an accommodation between the imperial representative and the Empress-Queen Maria Theresa, by a treaty concluded the following year at Breslau. So sensible were the contracting parties of the value of his lordship's mediation and services, that by a grant from the King of Prussia and the Empress-Queen, he was permitted to assume, in addition to the family armourial bearings, the Silesian eagle, with the motto 'ex bene merito,' and was moreover honoured by his own king with the additional dignity of the order of the Thistle. At Berlin he became acquainted, through the introduction of Frederick, with the famous Baron Trenck, who gratefully acknowledges in his Memoir, the 'paramount trouble' in which he was placed, and who, through his influence, procured for the young diplomat his interest with the Imperial court. In 1744 Lord Hyndford was sent ambassador to Russia, where he became a great favourite of the Empress Elizabeth, who took an active part in behalf of Maria Theresa; and he was highly instrumental in bringing about, in 1748, the peace of Aix-la-Chapelle, which terminated what is known in history as the war of the Austrian Succession. In this mission his lordship continued till the end of 1749, and on his return was constituted a privy councillor and lord of the bed-chamber. In 1752 he was sent to the Court of Vienna on his third embassy, which was accompanied by a new treaty which terminated, though he did not altogether withdraw from political life. In 1764 he received a further mark of the king's esteem in the appointment of lord vice-admiral of the northern waters of Scotland. Hyndford's sisters are divided between London and the family seat at Carmichael, in the vicinity of which the memory of the 'Ambassador' is still cherished with almost filial regard by the descendants of those who benefited by the munificence of his lordship, which he never ceased to manifest in promoting the interests of his county. During his whole lifetime, and particularly his latter years, his attention was unremittingly devoted to his estates, which he enhanced in value by extensive improvements, and enlarged by judicious purchases and advantageous exchanges. He died in 1767, leaving no issue. His official correspondence, extending to twenty-three volumes in manuscript, in the British Museum, to which it was secured by purchase in 1838.

**HYPANTHOCRINUS, a genus of fossil Crinoids, from the Silurian strata.**

**HYPANTHOCRINUS.**

The conditions under which the equation of the second degree belongs to an hyperboloid are given in *Surfaces of the Second Degree*, P. C. Of the two kinds of hyperboloids there mentioned, one, the single hyperboloid, is represented by the equation in which the signs of the two squares can be drawn upon it. Through every point of the surface two straight lines can be drawn, which are entirely upon the surface, and which are also in its tangent plane. When the surface is a circular hyperboloid, and the revolution of an hyperbola about its minor axis, these straight lines are all divided into two sets, each consisting of lines symmetrically disposed with respect to the axis, but never meeting it: so that if one of either set were to revolve
about the axis, it would describe the surface. Consequently a straight line revolving about an axis which is not in its plane, describes a single hyperboloid of revolution. This surface is therefore easily turned: the outside of a dice-box is an example. Latinly HYPERCYCLICUS, a genus of plants belonging to the natural order Hypericae. The calyx is 5-parted, or it has 5 sepals; 5 petals; 5 stamens, and a 3-celled capsule. The flowers of the species are mostly yellow. There are 13 British species of this genus, and 172 are enumerated by Don as growing in various parts of the world: St John's Wort is the common name of all the species.

Hypertrochium has an erect quadrangular stem, elliptical ovate oblong leaves, with a few pubellous dots, reflexed ovate lanceolate sepals having pilose streaks. Ovate petals, with purple streaks and dots beneath. It is the H. quadrangularis of the Flora, which is the type of the genus.

H. perforatum has an erect 2-edged stem, ovate or elliptical leaves with numerous pubellous dots, anthers with black dots, the styles as long as the calyx. It is found in large quantities in Britain and throughout Europe; also in the north of Asia and Africa. The flowers are of a bright yellow colour, dotted and streaked with purple; when rubbed they emit a powerful lemon-like scent and stain the fingers with dark purple. The whole of the plant contains a powerful volatile oil, which is aromatic and possibly astrigent, though as yet it has been but little used in medicine. Its sensible qualities being low, it was not long before it was found to be efficacious, entitle its virtues to a further trial. When boiled with alum this plant yields a yellow dye which is used for colouring wool. The common people of Germany and France gather this species on St John's Wotl with great ceremony on St John's day, and hang it in the windows and about their houses as a charm against evil spirits, storms, thunder, and all other calamities, mistaking the meaning of some medical writers who falsely called the plant Febrifugium, and not a notion that it was a remedy in manical disorders. At one time the people of Scotland used to carry it about their persons as a protection against witchcraft and enchantment, and thry fancy it prevents rpy milk by milking up the whole herb.

Cows and goats will eat the plant, but horses and sheep refuse it. It is the Aegopodium of Dioscorides (ii. 102). It is found at the present day on the high hills of Attica.

H. laxiculmis has a smooth herbaceous stem, rather distant oblong leaves, full of pubellous dots; the lower leaves narrow and lanceolate, segments of the calyx equal, nearly linear and acute. It is a native of Brazil, in the provinces of St. Paul and Minas Geraes, where a decoction of the leaves is used as a remedy against the bites of serpents.

H. crispa is a round branched stem, sessile lanceolate leaves, with yellow-brown stipules. The word is derived from the Greek -krispein, to cut, therefore it is called the cutting blinks. It is native in the regions of the Mediterranean, and is the iphaea of Hippocrates (Mor. Bub. i. 610); also of Dioscorides (ii. 161), and the Hypericum 'quod alii chamaperon' (Green). It is a species of St John's Wotl with great ceremony (De Plant. ii. 4. 2).

At the present day it grows near the sea in Attica.

H. perfoliatum, the iphaea of Dioscorides (ii. 163). It has a 2-edged stem; ovate, clasping, dotted leaves; fringed and dotted sepals and petals, and sessile flowers. It is a native of Italy.

H. Cordius has a shrubbery erect round stem, linear leaves in whorls with revolute margins, and a blunted linear calyx. It is the iphaea of Dioscorides (ii. 174), and the Cordia of Pliny (xxvi. 3). This species is a pretty little shrub, native of the Levant, and in dry places in the south of Europe.

H. tigridium is distinguished by its ascending downy stem, ovate blunt and pubescent leaves full of pubellous dots, numerous stamens, and many black dots in the corolla. It is a native of the East, about Constantinople, Thrace, and Armenia, and is frequently found on high mountains in company with H. perfoliatum. It is probably the iphaea of Dioscorides (iv. 6), and undoubtedly the Ageratum of Pliny Cordius.

H. Olympicum has elliptical lanceolate leaves full of pubellous dots; a round stem, and withering corolla and stamens. It is a native of Mount Olympus and of China. Fraas thinks it is the iphaea of Dioscorides.

Most of the species of Hypericum are showy, and deserve cultivation. The hardy herbaceous kinds will thrive in any common garden soil, and are easily propagated by dividing the roots in autumn. The golden pansies and frillike borders of the greenhouse of France will thrive best in a mixture of loam and peat and strike root readily in sand under a box.

Hypochras, a genus of plants belonging to the natural order Compositae, to the suborder Cichoroae, and to the section Lactuceae, which has yellow flowers and a brown fruit. Hypochras may be used in medicine as an astringent.

Hypodun. (Fishes, Fossil, P. C. S.)

Hypotirous Acid was discovered by Gay Lussac, who obtained it by adding nitric oxide gas in excess of oxygen gas, confined in a glass tube over mercury, containing a concentrated solution of potash; under these circumstances 50 volumes of oxygen gas unite with 200 volumes of nitric oxide gas, which forming hypotirous acid unite with alkali. This acid may also be obtained by long exposure of nitric oxide gas to solution of potash, or by exposing to intense cold a mixture of 50 volumes of oxygen gas with 200 volumes of nitric oxide gas. By this operation the acid is obtained in a liquid state and possesses the following properties:

At common temperatures it is green, but at 0° it is colourless; it is very volatile, so that when exposed to the air, it is rapidly converted into nitrous oxide which is stated to be 172, air being 1. When water is added, the acid is decomposed and converted into nitric acid and nitrous oxide, the latter escaping with effervescence. It is composed of

Three equivalents of Oxygen = 24
One equivalent of Azote = 14

Equivalent . 38

This acid does not combine directly with bases to form salts, being on its admixture converted into nitric acid and nitrous oxide. Hypotirities may however be formed by moderately heating certain nitrates, the acid of which losing two equivalents of oxygen, hypotirous acid remains, and in combination with the base. Hypotirities of lead may be formed by boiling metallic lead in a solution of the nitrate of that metal. Hypothec (from the Greek ipheco, a security, literally the subjection of a thing to the authority of another person) is a term derived from the civil law, still in use in the law of Scotland, and in that of France, with the literal variation hypothec; while, though in the law of England it is not received technical expression, it is occasionally used for describing any species of security holding the character which the French have attached to it. Hypothec and hypothecation have in their proper acceptation signified a right of security over something which was not placed in the creditor's possession, in contradistinction to pignora, which is now termed a pledge. This distinction properly clearly drawn in book iv. c. 6 of the Institute, and in the Pandects, xii., tit. 7, a 9, De Pignorat. Act. vel contr. Proprie pignora dicimus, quod ad creditoris trueta hypothecas, non passio possidet ad creditorum. But the distinction is often lost sight of, even in the original authorities of the civil law.

See Bracianus de Verborum Significatibns, fol. Hypothecas were distinguished into those created by contract, and the tacit or prastorian, admitted in certain circumstances without stipulation. The law on the subject will be found in the Pandects, lib. xii, tit. vii. De Pignoratia Actione, 5c. (above referred to), and in lib. de Pignoribus et Hypothecis.

The several securities over real property in various parts of the empire, which can be completed without the absolute transfer of the property to the creditor, are so many illustrations of consensual hypothec in description of property.

Conensual hypothec in moveables are nearly unknown in the British Empire, as the law, studying the interests of commerce, has discouraged this latest right, and, individual over merchandise and other movable goods while they are left apparently at the disposal of the original owner, and are liable to be viewed by all who transact with him as property. Bottomry and Receptantia are not examples in which it is countenanced. But there are still some tacit hypothec created by the operation of law, affording a preference to particular creditors over the property of a person who cannot or will not sell his lands. In this sense, hypothec is properly the counterpart of lien, the former being a tacit security over property which is in the debtor's
bands, the latter property over in the creditor's hands. Those provisions in the excise laws which give the revenue a preference over excisable commodities, and the instruments used in the manufacturing, are strictly the creation of tacit hypotheses. The provisions in the bankrupt acts for paying servants' wages and other debts out of the residuum funds of the bankrupt are the establishment of a general hypothesis over the estates.

In Scotland the landlord's privilege to seize the tenant's goods for arrears of rent is called a hypothec while it is unexercised—that is to say, before execution against them is commenced. This is a privilege which, if exercised, is a common form of hypothec over the goods. On an agricultural farm the crops stand hypothecated for the rent of the year of which it is the produce. The landlord's right exists so long as the crop is on the farm, and it extends to the reversion of it even from a bona fide purchaser within three months after the rent has fallen due, unless he has been a purchaser by bulk in open market. The hypothec includes for other effects—as the cattle on a farm, the tenant's furniture in a house—substitutes over the whole for each term's rent, and gives a preference for three months after the rent is due. The landlord's hypothec is not affected by the bankrupt statutes. Another right of a different description is called a hypothec in Scotland—viz., the right of a law agent to take his client's decree for expenses, or judgment for costs, in his own name, in order that he may recover payment of his account as aforesaid by the auditor of court. This right cannot be defeated by a collusive settlement. In Scotland a law agent, whether employed to conduct a litigation or in other professional business, such as conveyancing, is entitled to retain his employer's title-deeds and papers until his just account is paid. This right has also been called a hypothec, but it is clearly a lien.

In France there is a distinction between privileges and hypotheces. All tacit hypotheces, according to the division above laid in view, are included under the former, which are subdivided into a general preference over all the moveables or personal property in the debtor's possession, and limited preferences over particular articles of property for particular obligations. This last named, in so far as it affects moveable property, is the class of rights which has been spoken of above as tacit hypothec, and it includes the landlord's security for his rent. It is also a class of privileges on les immeubles, consisting of tacit preference over immovable and landed property, and is the object of much useful legislation, such securities being, from the efforts to give virtual effect to the law for partition of Successions, without reducing them below the proper extent for agricultural operations, more common in France than perhaps in any other part of the world. See on the matter of the immediately preceding remarks, Code Civil, lib. iii. tit. 18.

ICE-HOUSE, a building constructed for the purpose of keeping ice through the summer, by excluding, as perfectly as possible, the influence of changes in the temperature or humidity of the external atmosphere. Such structures are not only useful for preserving ice which is to be applied to the cooling of liquors, or to the preparation of articles of confectionary, but also as affording the most effectual means known for keeping meat, fish, game, vegetables, and fruit sweet and fresh in hot weather. In Loudon's 'Encyclopedia of Cottage, Farm, and Villa Architecture,' where (p. 736-739) a detailed account is given of various modes of constructing ice-houses, it is observed that although these important conveniences are rarely to be found among the buildings of an English farm, they are becoming of more and more common in North America, and might be advantageously introduced in this country, especially upon such farms as are connected with inns. To a gentleman's country residence an ice-house is always an important, and, in some cases, almost an indispensable appointment.

One of the simplest modes of preserving ice, alluded to in the work above mentioned, consists in enveloping the ice in a great quantity of straw, above the surface of the ground, in such a position that moisture, which is even more injurious than heat, may drain off freely. For this purpose the ground should be raised in the form of a flattened cone, upon which should be laid a stratum of straw-covered bags, the agents to the thickness of a foot or more, and the ice is piled upon it in a compact conical mass, the larger the better. Over the ice is laid first a foot of thickness of straw, then baggo-wood to a further thickness of two feet, the interstices of which have the effect of keeping a stratum of confined air round about the pile of ice; and finally two or three feet of straw arranged as a mat. The best situation for such an ice-stack or mound is stated by Loudon to be under the shade of trees, or, where such shelter cannot be obtained, under a kind of shed roof, with an opening to the north only. Some writers, however, among whom may be mentioned Cobbold, who notices the subject in his 'Cottage Economy,' considers that, in consequence of their tendency to increase the humidity of the air, the vicinity of trees is objectionable. On the same principle some recommendation is made in North Americaners, in preference to a northern aspect, for the entrance to an ice-house, in order that the morning sun may dissipate the damp air from it.

An underground ice-house may, according to Loudon, be simply a large cellar, with hollow or double walls, floor, roof, and doors, and furnished with a trapped drain to allow the escape of such water as may be produced by a partial thaw, without admitting any air. Such ice-houses are usually formed in the shape of a hollow square, of which the advantage is, that the ice is kept more compactly together than any other form, because, in case of any thaw taking place, the remaining ice will naturally slip down, so as to fill in the hollow, and thus preserve its shape. Loudon does not conceive sufficient to compensate for the greatly increased expense of construction involved in the adoption of the conical form. A plain square room, he observes, with double side walls, a step apartment, a double arch over, and a double floor under, which can be built with the same ease as any common cellar, will, all other circumstances being alike favourable, keep the ice as long as any conical form whatsoever. In all cases it is well to interpose a layer of straw, reeds, or chaff, which is preferred to straw in Italy, where it is used for packing ice for travelling, between the walls and the ice; and by the use of faggots as well as straw any perfectly dry cellar in a suitable situation may be used as an ice-house. In some situations a sufficient degree of hollowness in the walls may be produced by the adoption of the plan of building with bricks or stones placed under Bellows, P. 250, or by some other contrivance. One mode of building hollow walls which may be thus applied, consists in the use of half-bricks, divided longitudinally, as stretchers, leaving a space of an inch or more. Such solid bricks or half-bricks are easily produced by nearly cutting the brick in half with a wire before burning, when, after paying duty only as a single brick, it may, when burnt, be easily broken in two. Hollow boxes for ice (houses under Bellows, P. 250), or by some similar contrivance. One mode of building hollow walls which may be thus applied, consists in the use of half-bricks, divided longitudinally, as stretchers, leaving a space of an inch or more. similar method is pursued in Portugal, where, when the snow has been collected in a deep gulf, some grass or green soda, covered with dung from the sheep-pens, is thrown over it; and soLB the snow is preserved that it may be taken up and transported to a considerable distance throughout the summer.

In connection with the subject of this article, Loudon describes a kind of pantry intended to serve some of the purposes of an ice-house, in which the evaporation of water, constantly trickling down the outside of a close conical chamber, fixed in the ground, is employed as a means of refrigeration; and also, in section 2596 of his 'First Additions to 'Ice-Box,' an ice-box which might almost be termed a portable ice-house. It consists of an inner and outer apartment, the latter being filled with burnt cork reduced to powder, this being found to possess higher non-conducting properties than the charcoal of wood. The lid is double, and is filled with the same substance; and it is made perfectly tight by means of projecting ledges, which, when shut, dip into a gutter filled with water. Ice may be preserved for several weeks in such a box, in which also bottles, dishes, &c. may be placed. Similar to this contrivance is the American ice-safe lately introduced into this country.

ICE-PLANT. [Mesembryanthemum. P. C.]

ICHNEUMON, a genus of insects belonging to the order Hymenoptera, and family Pididae, or Ichneumonidae, in the arrangement of Latreille. The genus, as defined by Linnaeus, included such pappophorous hymenoptera as are furnished with veined wings (the anterior pair present or in the female, often or sometimes) a pair of short or setaceous vibratile antennae composed of a great number of articulations, and an ovipositor of various length and complicated structure. The Linnaean genus now constitutes a group including a great many well-marked genera and an immense assemblage of species. All these are remarkable for the habits of their larvæ, which are parasitic in the bodies of other insects. These bodies the perfect ichneumons perforate by means of their ovipositors, and there lay their eggs. This destructive habit gave rise to the name by which they are known; a comparison being drawn between them and the Egyptian ichneumon (Vespa Ichneumon), the quadruped celebrated as the destroyer of serpents and crocodiles.

The history of these insects has attracted much attention among naturalists, and many elaborate memoirs have been written upon them. The purpose they serve in the economy of nature has been well described by Kirby and Spence: 'The great body of the ichneumon tribe is employed in keeping within their proper limits the infinite host of lepidopterous larvæ and destroying, however, many insects of other orders. Such is the activity and address of the Ichneumonidae that scarcely any concealment, except perhaps the waters, can secure their prey from them; and neither bulk, concealment, nor the power of tarrying upon the wing, has prevented them from effecting their purpose. They attack the ruthless spider in his toils; they discover the retreat of the little bee, that for safety bears into timber, and, though its enemy ichneumon cannot enter its cell, the long ovipositor she reaches the helpless grub, which its parent vainly thought secured from every foe, and deposits in it an egg which produces a larvæ that destroys it. In vain does the destructive Cecidomia of the wheat conceal its larvæ within the glumes that so closely cover the grain; three species of these minute benefactors of our race, sent in mercy by Heaven, know how to introduce their eggs into them, thus preventing the mischief they would otherwise occasion, and saving mankind from the horrors of famine. In vain also the Cymips, by its magic touch, produces the curious excrescences on various trees and plants, called galls, for the nutriment and defence of its progeny; the gall wasp is a great enchanter to its destined inmates, pierces its wall, however thick, and commits the destroying egg to its offspring. Even the clover weevil is not safe within the legumen of that plant; nor the wireworm in the earth from which it takes its nourishment. (Introduction to Entomology, vol. i. p. 267.) In the third volume of the Transactions of the Linnean Society, in a Memoir by Mr. Marsham, may be found an account of the operations of one of these insects, the Pimpla rufa, observed by him in Kew Gardens. The details of its proceedings there given are exceedingly interesting, and present a remarkable picture of the mode in which the larvæ of ichneumons are in some cases solitary, in others gregarious. The members of a company quit the bodies of their victims and spin a cocoon of silk before being transformed into the chrysalis state. Those of others remain and use the skin of the caterpillar as a covering. By a wonderful instinct, when the grub leaves the egg, instead of letting the caterpillar remain within whose body it has hatched, and thereby destroying its food, it confines itself to the fatty part until it has nearly attained its full size.'

ICHNOCARPUS (from ἱχνος, a 'footstep,' vestige, and καρπος, a 'fruit,' in reference to the slender follicles), a genus of plants belonging to the natural order Apocynaceae. It has a white or silver-colored and fragrant, long lancolate leaves tapering to both ends, axillary peduncles very long and racemosi. It is a native of Ceylon and Nepal. The flowers are small and purple; the leaves deep green above and pale beneath. According to Professor Boyle, it is sometimes used in India as a substitute for sarvaparilla, and it is also mentioned by Aelianus in his Renedia Quinennia as a medicinal plant.

I. schmutteringi has oblong lancolate leaves tapering to both ends, and axillary trichotomous spreading peduncles. It is a native of Nepal, and has large handsome flowers.

I. fastuolus is a gibbous shrub with turning stems, oval acute leaves, small flowers, and fruit, from Tibet, on the banks of the Indus. The corolla is white and sweet-scented. It is a native of Sierra Leone, and about the river Bascha, in woods and among bushes.

I. Lanzonii is a fuscous stem, ovate oblong leaves, lateral 3-flowered peduncles. It is a native of Zanzibar. All the species of Ichnocarpus grow well in a mixture of loam, peat, and sand, and cuttings strike readily in sand under a hand-light.

(Don. Gardener's Dict.; Lindley, Flora Medica.)

ICHTHYOLOGY, RECENT ADDITIONS TO. The researches of naturalists in all parts of the world have of late years greatly added to our knowledge of fishes, and revived the interest attached to this important branch of vertebrate Zoology.

The connection which the genius and labours of Agassiz have established between Ichthyology and Geology, little tended to promote research in this direction, and the results are beginning to hold no unimportant place in natural-history publications. Moreover, now that philosophic Zoology is fast gaining ground, and mastering the species-making and mere collecting, which had so long taken the name and usurped the place of the science, the study of a class of animals including the links between the vertebrata and invertebrata, is assuming a degree of importance to which it formerly could lay no claim. On the much-neglected subject of the classification and the distribution of fishes, some important researches have been recently made known, of which, as they will probably receive no great progress of Ichthyology, we shall here give a brief summary.

Classification of Fishes. — The natural arrangement of fishes has recently engaged the attention of two of the most eminent and philosophical naturalists of our time, W. S. MacClay and J. Muller. Mr. MacClay's views on this subject are made known in a letter to an eminent Indian naturalist, Mr. M'Cleld and were published in the Calcutta Journal of Natural History for July, 1841. Throughout they are influenced by the quinarian hypothesis, of which he is the distinguished author. He bases his classification on three generally admitted facts, which he holds to be incontestable. The first is the near approach of fishes to Benthonic Amphibia, which, with Swainson, he considers to be made by means of Lepidos and Moltha. 2nd. The near approach of fishes to the Cetaceous Mammalia, the viviparous sharks constituting the connecting link between the two. 3rd. The fact that it is their being the most imperfect of vertebrata, the most typical of fishes ought therefore to be the most imperfect of them, i.e. the furthest removed from the type of vertebrata, a position in which many naturalists still believe them to hold. He regards as examples of such fishes the Cyclostome. Bearing the above 'fundamental facts' in mind, he constitutes the following primary divisions:

Abdominal Branchiostegalia. branchiostegalia. Gills pectinated.

1. Plagiostomi. Cartilaginous fishes with fixed branchiae, leading to Mammalia.

3. Bony fishes with free branchiae, leading to Amphibia.
Normal group. Actinopterygii. Fish breathing with gills, not lungs.

4. Lophobranchii. Bony fishes breathing by tufts arranged in pairs along the branchial arches.

5. Cyclostomi. Cartilaginous fishes breathing by a bony or cartilaginous gill.

Mr. Melday has not yet presented an analysis of the families and genera included under the above five orders, with the exception of those of the third, Osteropterygii, a term by which he proposes to designate the osseous fishes having pectoral fins. The following table of his subdivisions of this important order will convey to the naturalist a clear idea of his system.

Osteropterygii.

Tribe 1. Balistidae. Maxillary bones soldered to the internal maxillaries, and both to the palatine arch; opercula and gills concealed beneath the skin. Includes the families Balistidae, Ostraciidae, Cephalaspiidae, Orthosomatidae, Diocotidae.

Tribe 4. Pleuronectidae. Ventral fins, when existing, inserted under the pectorals, and directly suspended to the bones of the shoulder. Anguidae, Echeneidae, Cyclopteridae, Pleuronectidae, Gobiidae.

Tribe 5. Abdominidae. Ventral suspensions behind the pectorals, and not attached to the bones of the shoulders. Siluridae, Cyprinidae, Esoxidae, Cuspidae, Salmonidae.

Geographical Distribution of Fishes.—This branch of ichthyology is beginning to attract the attention and research which the interest of the subject demands. Within the last five years the example of Yarrell has been followed in many countries, and valuable local monographs published, with excellent illustrations. In the north of Europe, besides the writings of Pison and Eckern, the fishes of Denmark are in progress of illustration by Henrik Kroeyer. Those of Belgium have been carefully examined by M. de Selys Longchamps. In that naturalist's Fauna Belgica fifty-three fresh water species have been enumerated, and the list is expected to be extended. Of the forty, forty-three live only in fresh water; six in fresh water, but go to the mouths of rivers in winter, and may be driven out by the rivers in spring or summer. Of the sea-fishes thirty pass up the Scheldt as far as Antwerp. The fresh-water fishes of central Europe are engaging the attention of Agassiz, and his work on them is in progress of publication. Freyer has published an account of those inhabiting Carniola, amounting to thirty-two species. Italian ichthyology has been admirably illustrated by Charles Bonaparte, the Prince of Canino. In Asia the fishes of the Caspian have been described by Eichwald in his Fauna Caspica-Caucasica, published in 1841. Those inhabiting the rivers of Syria have been enumerated by Heckel (1843) from the collections of Koch. Fifty-seven species inhabit the rivers of Orange and Euphrates, of which not fewer than forty-five are Cyprinidae. Indian ichthyology has received valuable contributions from Mr. Clelland, whose papers have been chiefly published in the Calcutta Journal. In Siebold's Fauna Japanica (1842) there are accounts and figures of Japanese fishes by Temminck and Schlegel. The most valuable contribution ever made to our knowledge of the ichthyology of Eastern Asia was communicated to the British Association at Cambridge in 1842, in the form of a report on the 'Ichthyology of China,' by Dr. Richardson. From his researches it appears that the fishes of that region are not only very numerous, but vary in manner very markedly from land to land, and on account of the extensive fisheries there carried on. His remarks on their distribution are highly interesting. It would appear that chains of islands or coasts having an east and west extension determine the extent of the range of species and groups of species. For example, to take the intertropical zone of the ocean, we find a vast number of fishes common to the Red Sea, the coasts of Madagascar, the Mauritius, the Indian Ocean, the south of China, the Philippines, the Malay Archipelago, the northern coast of Australia, and the whole extent of Polynesia including the Sandwich Islands. In regard to the generic forms of the fresh-water fishes, China agrees with the peninsula of India. Were the vast zone in question, embracing more than two-thirds of the circumference of the globe, to be subject to glaciation, we should find the remains of fishes similar everywhere throughout, the species which have a local distribution being few and unimportant.

This result of Dr. Richardson's researches is of the highest importance when brought to bear on geological considerations. Dr. Richardson has also been engaged in the special investigation of the ichthyology of Australia, and his many valuable memoirs on that subject may be consulted in the Transactions of the Zoological Society, and in the Annals of Natural History.

In Diefenbach's Travels in New Zealand (1843), the same indefatigable and philosophic zoologist has published, in conjunction with Mr. Gray, a list of the fishes of New Zealand. Ninety-two species are there enumerated. In Smith's Illustrations of the Zoology of South Africa, figures and descriptions are given of the fishes of the Cape of Good Hope. The researches of Professor P. Peters on the fishes of Madeira (Zeological Transactions and Proceedings).

The labours of Jenyns on the fishes collected during Captain Fitzroy's voyage have contributed much to our knowledge of the ichthyology of the southern extremity of South America, whilst that of Guiana has been illustrated by Sir Robert Schomburgk, in the Naturalist's Library. De Kay's Zoology of New York (1842) has made us acquainted in detail with the fishes of the United States. They amount, so far as known, to 440 species, distributed through 166 genera and 32 families. In the State of New York there are 126 Acanthopterygii, 15 Malacopterygii, 18 Pleurostomi, 3 species of sturgeon, and 27 cartilaginous fishes. It is to be regretted that the researches of Dr. Parran on the West Indian fishes are still unpublished, since they would go a long way towards enabling us to gain a connected view of the ichthyology of the new world.

As far as we can judge from the materials as yet collected, the distribution of fishes appears to be determined by the same laws which regulate that of other aquatic animals. Climate, composition of the element in which they live (whether salt, brackish, or fresh), and conformation of the sea or river bed, on which the depth of water depends, are the great regulating influences. The distribution of certain species of fishes is confined to certain areas, and no attempt has been made to conduct it in deep water, whilst others can only be maintained among shallows, shows the influence of depth; the fact pointed out by Dr. Richardson that the sea, by ranges of land or reefs, is divided for great distances, and that the climatal parallel, are peopled by the same species of fishes, is an instance of the action of the combined influences of climate and depth. The distinctness as to genera and species of the greater number of river and lake fishes from those inhabiting the sea depends on the second of the three great influences enumerated—that of the composition of the element in which they live. Great depths cut off the range of species even when climatal conditions are similar. The fishes of the coast of the United States are for the most part distinct from those on our own side of the Atlantic. Some fishes have very limited ranges in depth compared with others, and, generally speaking, it may be assumed that those having the greatest vertical range (i.e., range in depth) have also the widest horizontal extension, a fact depending on the capacity of such species for living under a greater variety of conditions. Barriers of land, as chains of mountains, determining the courses of rivers, are often the boundaries between two distinct species of fresh-water fish, and in like manner barriers of land may separate two very distinct marine genera. The distribution of marine vegetables, affecting the distribution of numerous marine invertebrata which feed on those vegetables, and in their turn serve to furnish food for fishes, will materially affect the distribution.
of many species of the latter. So also will the presence of currents, and even the agency of man, assist often unintentionally in the conveyance of ova from one country to another. Distant regions, presenting similar conditions, such as the Norwegian Arctic Sea, are inhabited by species closely related but not identical, and presenting a general aspect very similar, depending on characters of form and colour, &c. It is probable also that the fishes inhabiting the greater depths of the tropical seas resemble each other more closely than those of temperate climates, and that those of the latter in like manner approach Arctic forms.

A brief glance at the range and distribution of the principal genera of fishes will illustrate the positions.

The lowest and most anomalous of all the species of fishes, the Branchiostoma, is generally distributed through the seas of Europe. Only one species is known, yet we cannot but hope that the researches of the many active naturalists now occupied with the study of marine zoology will bring to light new forms connecting the Lancelet with other genera. The Myxinoe, or glutinous hag, almost exactly square in form and structure, is confined to the most northern and most southern seas, and is replaced in the higher parts of the southern hemisphere by the equally curious and nearly allied genus Hepsetusmiss.

The lampreys inhabit the fresh waters of Europe and America, but the same species is found in each. The Lepadid, Lepadis, the connecting link between fishes and reptiles, so curious in organization that it is still disputed whether it is a fish or a reptile, and a genus closely allied has just (1846) been discovered by Dr. Peters on the eastern coast of the same continent.

The rays and sharks are universally distributed, but many of the species are very local, and are apparently regulated in their range by climatic zones. The seas of Europe can boast of the greater number, though fortunately the most formidable of the species are not of a fished nature. The largest species, as the great Stichus maximus, the basking shark, are harmless, and have their saur-coiters inhabit the temperate zone. Size among fishes does not appear to bear any relation to latitude. Chimaera is northern and southern, extending from the Arctic to the Antarctic. The Sciaenidae inhabit the more southern and tropical, especially the curious forms of Cetra-

Among the most characteristic fishes of the fresh waters of tropical countries are the Siluridae, which abound in the regions of Central Asia, where almost all the species of the typical genus Silurus occur. A single offshoot finds its way to Europe. Pimelodus and Colluchthys are American genera of this family; the electrical Mullirajura, North African; Lorichthys Loricarii, Brazilian, and Pontophryne, an interesting and widely marked is the fresh-water family Cyprinidae. The true carps are characteristic of the old world; Catostoma and Alosa are American.

The genera Centriscus and Fistularia are, with the exception of a single Mediterranean species, tropical. The genera of Labridae have well-marked geographical limits, being grouped together in tropical seas, being replaced in temperate regions by Labrums and Cremniris. There are exceptions, however, of each. The frog-fishes Lophius and Chionorophis are chiefly represented in Africa and South America. A single species of Platyrrhina is a native of European seas. De Kay enumerates seven Lophini as inhabitants of the United States, and Richardson has described some Australian species. The Goby tribe probably reaches Europe; and some of the species of Gobius are remarkable for the depth at which they live. The Blennies are truly European, with very few exceptions. The Gunnela are mostly of northern seas. Some species of the Goby tribe inhabit fresh water, as the genus Tenuiceps, which is found in marshes in India. Comptopus lives in Lake Baikal, and one or two species of Gobius proper live in rivers.

The Magulidae are very generally extended. They have been said to be absent from North America, but this is incorrect, four species of Mugil inhabiting the United States.

The Centriscidae and Platyrrhina are essentially tropical, being all natives of the eastern regions of Asia. Their organization is peculiarly adapted to their climatic range. The Tetraodon are fishes of warm climates, and many species inhabit the coasts of the South Sea, both islands of, fresh water, of which the Gurnard is the type, has a very extensive distribution. The true gurnards are mostly European; Scorpaenas ranges from Europe to Australia. Platydontus is peculiarly Indian. Sphyraena is a genus of the old world, with one or two exceptions.

The Percomtidae, chief of the Actinopterygii, is partly composed of marine and partly of fresh-water genera. The genus Percus is characteristic of the northern temperate zone. Mesoprinus, Dicopen, Dicotreomus, and Scorpaena are cosmopolitan. Mullus and Paralipsa are European genera. Holocentrus, Myrceus, and Priacanthus, and Dusius are represented throughout the entire distribution. Myurus is an Indian fresh-water genus. Percopsis, Paimbus, Centruromus, and Por
da is an American genus of the perch family, Beryx, Trachichthys, Helotes, Pododes, and Chiromya are Australian
IGNICA, a genus of plants belonging to the natural order Burnerales, comprises 16 species, all having petals inserted under the disk, recurved, sepalis, valvate; 10 stamens shorter than the petals inserted with them; a cup-shaped disk with 10 crenatures at the margin; a sessile 5-celled ovary with numerous seeds, ovary style; a 6-angled stigma; a globose obtuse I-celled drupe with thick and fleshy dissepiments; reniform seeds without albumen. The species are shrubs or trees with uncinually prickly leaves, and thorns covered with thickened and punctured racemes which are terminal or axillary.

1. heterophylla has tornate or pinnate leaves, with stalked orate, acuminated, entire, simply-reined leaflets; the racemes shorter than the leaves. The plant is that known as 1. Araucanchini of Aublet. It is a tree 50 feet in height, growing in Guyana, on the banks of the river Couron, where it is called by the natives Araucanchini. When an incision is made in the bark of this tree, a yellow balsamic aromatic fluid exudes, which retains its fluidity a long time after exposure to the air. This fluid is used by the Gyanese as an application to wounds. A resin is found also in the seeds, and the natives of Guiana carry the nuts about with them on account of the scent they give out. These nuts they often send as presents to their friends. The Caribs also use the exudation for mixing with oil with which they anoint their bodies. It was called O CREBOL by Oviedo acuminated leaflets, with the racemes few-flowered, somewhat corymbose, and 6 times shorter than the petiole. It is a small tree, a native of the Guiana and of the Guiana of Guiana. Its root is called ACRÓ. The whole plant is sweet-scented, and like the last species yields a clear balsamic fluid when it is wounded. It is burned as a perfume, and used as a remedy in dysentery. The seeds are collected, with a white resin, into grey vases, and is used by the natives for burning as a perfume. The Carib name of this tree is ARAUCAEB.

There are several species of Icica, all of which yield the same transparent fluid, resembling turpentine in many of its properties.

1. Icicito, a native of Brazil, yields a resin, which is brought into the market under the name of gum elemi, but it is not the resin of this tree that is found in the wood of Guiana, where it is called Chipa. The fluid which exudes from it yields on evaporation a resin. 1. altisima grows in Guiana. There are two varieties of this tree, known by the name of white cedar and red cedar. The latter is a very durable wood, and is used for making household furniture, boats, canoes, etc.

IDENTITY. [SAMENES, P. C. S.]

IDIOT. [INNAT, P. C.]

IGNATIUS, Patriarch of Constantinople. The schism of the first three emperors began under Photius, who persecuted this prelate, and usurped his see [PROCTES, P. C.], gives importance to the life of Ignatius. He was born in 798, and was the son of the Emperor Michael Conzobolus and his mistress Alpina, who were the children of Emperor Nicephorus. On the revolt of Leo the Armenian, Michael surrendered to him the throne, which he had occupied for only a year and nine months, and abdicated the monastic life. His sons followed the example of their father, and the youngest, Nicetas, then aged fourteen, changed his name into that of Ignatius. The new emperor, in order not to disturb the possession of power, separated the several members of the family of Michael, and caused his two sons Eustathius and Nicetas to be made eunuchs.

During the reign of the three emperors Leo, Michael II., and Constantine the Maniakes, the Patriarch of Constantinople, and caused Methodius to be elected to be his place. Four years after, on the death of Methodius, the patriarchal dignity was bestowed upon Ignatius, who was consecrated as his successor, and was placed in his monastery, where he had acquired a high reputation for piety and talent, and to accept this perilous honour. He had not long enjoyed this see when the possession of it was troubled by his contest with Bardas, the brother of the empress, whom he had accused of his scandalous excesses. Bardas having obtained considerable influence over the mind of the young Emperor Michael, whose voice he flattered and encouraged, induced him to take the reins of government, and to compel his Patriarch to draw to a convent, and to accept the vows. Ignatius, when summoned to lend his authority to this unifilial act, did not consent himself with remonstrating against it, but gave them a stern refusal. Bardas then caused Ignatius to be banished to the isle of Terebinthos, and deprived of his see, which he had held for eleven years; every means were afterwards employed, but without effect, to induce him to resign. Photius, a eunuch and a person of delicate character, who was very much favoured the Iconoclasts, was by the will of the emperor, but without the consent of the church, appointed to the Patriarchate of Constantinople. The controversy of Photius with the Church of Rome, and its issue, are fully detailed in the article Photius, P. C.

In the year 866 Bardas was put to death; and Basil, the Macedonian, became possessed of the supreme power. One of the first acts of his reign was to recall Ignatius, who was triumphantly reinstated in his patriarchal dignity on the 3rd of November, 867. At his suggestion a Council was assembled at Constantinople, which ranks in the Roman Church as an ecumenical Council. In the proceedings of this Council, Photius and his partisans were excommunicated, and their opinions on the iconography were condemned.

From this time Ignatius was allowed to rule the Greek Church without opposition, and his episcopacy was adorned by many Christian virtues, and by a piety which long and severe persecution could not extinguish. He died on the 5th of October, 878, on which day the Greek and Roman Churches still celebrate his memory. He was buried in the Church of St. Sophia; but his remains were afterwards transferred to that of St. Michael, near the Isoporus. The details of his life are chiefly drawn from Nicetas, his biographer, who had known him personally. It has been published by Bader, Ingolstadt, 1604.

IGNIS FATUUS, a meteor resembling a flame, which floats in the atmosphere at a few feet above the surface of the ground. It is generally observed by night, either stationary or in motion, over marshes or burial grounds; but in the "Philosophical Transactions," for 1694, there is an account of some ricks of hay being burnt at Dolkely, in the preceding year, by a vapour like a weak blue flame which came from the sea: Derham (Phil. Trans. 1729) relates that he observed about a decayed thistle a flame in motion, which receded from him as he advanced towards it; and Beccaria states that he has seen similar flames emitted by a straw which lay on some stones near a river: this philosopher observes that such meteors are most usually witnessed during a fall of rain or snow; he adds that they often appear on country roads and that they have been seen on the banks of the Danube. Tschermak (Deutscher Merkur, Oct. 1763) mentions that he saw at Zellfelder a meteor which at first approached him and afterwards receded from him to a distance of 800 paces; he adds that it then disappeared, and at the end of half an hour it again became visible.

Occasionally such meteors have been observed to follow or advance towards a spectator; but in general they have not ceased to be observed, and it has happened that from their resemblance to the flame of a distant lamp, they have led the unwary traveller into dangerous swamps. Little confidence can be placed in the descriptions given of such phenomena, as few persons have been able to examine them with due attention; and commonly they have been observed under the influence of an ill-regulated imagination rather than a philosophical spirit. A plausible hypothesis which has been proposed in order to account for this phenomenon is that a phosphuretted or a carburetted hydrogen gas, produced by the decomposition of animal or vegetable substances, rises from the ground or from stagnant water, either in the form of a dense mist, or in the form of a cloud, or in great abundance and then becomes a train or a horizontal column of vapour of variable dimensions: such gas may take fire by electricity or spontaneous combustion, and is particularly free from moisture; and the flame communicating itself successively to other parts of a line or column, the latter being in a state of undulation from the agitations of the atmosphere, will give rise to the appearance...
at a motion from place to place. The brightness of the
meteor will change with the varying quantity or purity of
the gas; and its temporary disappearance may be caused by the
quantity being in some places too small to render the flame
visible. Spontaneous ignitions are well known to take
occurrence in a number of vegetable and animal substances
while undergoing decomposition, in consequence of the in-
flammable matter coming in contact with common air or with
oxygen.

II. FORD. There are two places of this name in Essex,
both in the hundred of Reacon. Great Illford is a village
included for civil purposes in the ward and former chapelry
of Barking, on the south bank of the river Roding, 1 mile and
a half from the famous church of Barking. It is one of the
principal towns of the hundred, and has a large
population. It contains many large and handsome
buildings, and is well supplied with water and
convenience for trade.

Little Illford is a parish separated from that of Barking
by the river Roding. The parish has an area of 750 acres,
and contains a population of 23,989. It is one of the
principal towns of the hundred, and has a large
population. It contains many large and handsome
buildings, and is well supplied with water and
convenience for trade.

ILLMEN, LAKE. [REBECA, P.C.]

I'MOLA, INNOCENZIO DA, a pupil of Francucci, and
a distinguished painter, of the early half of the sixteenth
century. His family name was Francucci; he was born
in the latter half of the fourteenth century, and took his
name, but he lived chiefly at Bologna. He painted from
1506 until 1549: Vasari says he died aged fifty-six, but this
is apparently an error, or he must have commenced to paint
when he was thirty or thirty-five years of age. However, the
statement that he worked with Franci, and, according to Vasari, he studied
also with Albertinelli at Florence. In 1517 he produced
what is now considered his masterpiece. It is a large picture,
now in the Academy at Bologna, but formerly over the great
altar of San Michele in Bosco, representing, in the lower
part, the Archangel Michael vanquishing Satan, Saints Peter
and Benedict at the sides, and above them the clouds
the Madonna and Child surrounded by angels; the whole
is treated much in the second manner of Raphael. Il has
been engraved by A. Marchi for the "Pinacoteca di Bologna." There
is also a very superior work by him in the cathedral
of Faenza. Da I'mola's style is termed by Lanzi "Raffigluig"
and it appears that several of his works have passed for
the works of Raphael, that is, for works of his second style. He
was also a good fresco painter.

(Vanvitelli, G. P. T. [R.]; Lanzi, Storia Pictoria,[
R.]; Giordani, Pinacoteca di Bologna.)

IMPEACHMENT. [PARLIAMENT, P.C., p. 279.]

IMPETRATORIA (so named from its supposed imperial
virtues) is a species of the Heliotrope, and one of the most
harmless of the order Umbelliferae. It is a native of
Europe and New England, in damp meadows and woods.
This species is the Masterwort of old English herbalists, and
the root is much used in medicine as an antidote against
poisons, a diuretic, and sudorific; and Lomelino affirms that
an infusion of it in wine has cured agues which have resisted
quinine. When chewed, it exerts a copious flow of saliva,
and acts as an agreeable stimulant to the gums. It is
recommended in cases of rheumatic toothache, and is cultivated
in many places for the London market.

I. angustifolia, the Narrow-leaved Masterwort, has
bitter

ILLEGAI CONTRACT. [PUBLIC POLICY, P.C. S.]

INK. [MASON, P.B.]

INCEST. During the Protectorate in the year 1650,
incest and adultery were made capital offences, but at the
Restoration this law was not confirmed. Incest in England is
now only punishable by the ecclesiastical courts, according
to the rules of the canon law. This law also determines what
kind of sexual connection is incest. Incest may be committed
by married persons or persons unmarrried. If adultery is
committed, it may also be incest, and if fornication is
committed, it may also be incest. The notion of incest is founded
upon the degree of consanguinity or affinity between the
parties who have had the sexual connection.

The term Incest is from the Roman term incestum, which
is the same as Non Cassum, n't pured, 'a its its general
sense signified any offence against positive morality, or
religion. Persons within certain degrees of consanguinity could
not contract a marriage; and if they did contract a marriage
or live together, they were no longer fit persons to live with one
woman, whether married or not, who were incapable of
contracting a lawful marriage by reason of consanguinity. If the
parties were capable of contracting such marriage, the con-
action would be Stuprum, which, in its limited sense, partly corresponds to fornication.

The Roman notion of Incestum was not confined to the case of blood relationship. The exclusion of the fruit of an illicit connexion could not contract a marriage, even after the adopted child was emancipated. The Romans do not appear to have had any direct legislation on this subject till the Codex Theodosianus. The rules of law that were in force were founded upon positive morality and usage. The Lex Julia which was enacted in the time of Augustus treated of incest only indirectly, and so far as it concerned the object of that law, which was the punishment of adultery.

In some cases of incest at Rome, there was capital punishment. (Dion Cassius, liv. c. 22; Tacitus, Annal., vi. 19.) The punishment was inflicted by Reins, Criminalrecht der Rämer, and with a reference to the numerous authorities.

INCH OF CANDLE. [Aucto, P. C.]

INCHBALD, MRS. ELIZABETH, who married name was Simpson, was the daughter of a Suffolk farmer residing near Bury St. Edmunds. She was born in 1753. Prone to romantic notions, and losing her father in youth, she ran away at the age of sixteen to seek her fortune, and endeavoured to procure an engagement as an actress in London. After several adventures, she obtained a place in a country theatre, and soon married Mr. Inchbald, a respectable actor, much older than herself. She longed to live for some years in mutual regard and comfort. Mr. and Mrs. Inchbald performed for four seasons in Edinburgh, and, after an engagement at York, went to France for a time. In 1779 Mr. Inchbald died at London, leaving behind his widow in the most destitute condition. She continued to play secondary parts at Covent-Garden. She continued on the stage till 1789, but always owed her favour with the public less to her merits as an actress than to the sweetness of her family likeness, and to the unassuming character which she was known to maintain in private life. She had begun to write dramatic pieces several years before her retirement from the stage: the first of these, a slight afterpiece, was acted and printed in 1784; and from that time till 1805 she wrote plays in rapid succession, producing nineteen in all, one of which, 'Lovers' Vows,' is an adaptation from Kotzebue. Her dramatic genius was not of a very high class, and several of her comedies had much success, and one or two of them still keep their place on the stage. They gained for her the means not only of supporting herself with honourable economy, but of making a handsome allowance to an invalid sister, and of saving a considerable sum. Her melo-dramatic comedy of 'Such Things Are' gained for her more than four hundred pounds: as much was produced by 'Wives as they Were and Married' in 1802, when on a certain opening night Miss Inchbald, most strongly characterised of her plays, she received seven hundred pounds. She edited, with biographical and critical remarks, 'The British Theatre,' a collection of acting plays, 25 in number, which was published in 1809; and a collection of 'Farcers,' 7 vols. Mrs. Inchbald's literary talents are best exhibited by her two novels, 'A Simple Story,' first published in 1791, and 'Nature and Art,' in 1796. Both became extremely popular, and deservedly so, and have been reprinted in our time in collections of standard novels. She died on the 1st of August, 1821, in a boarding-house at Kensington, leaving nearly 6000l. in legacies to her relatives and friends, to the Roman Catholic poor, to the Covent-Garden Theatrical Fund, and small sums to her laundress and hairdresser, who provided she should inquire of her executors concerning her decease. She had written an account of her recollections, which was published in 1800, and has been reprinted in 1809; and, in obedience to her will, it was destroyed after her death. But her journal, kept regularly for many years, was preserved; and from it and her letters were written Mr. Morley's famous biography of 1833.

INCLOSURE. The term inclosure is applied to the closing and partitioning of lands in England and Wales, which are comprehended under the general name of Commons or Consumable Land. The inclosure of the lands comprehended under this term enables us to form a better estimate of the state of agriculture in England and its capabilities of improvement. We thus learn also what was the state of the condition of the lands in England before inclosures were made.

It is necessary to define the terms Commons, and Consumable and Internized Lands. Commons or Consumable Lands are lands in a state of nature or waste, of which individuals have not the severely. Consumable Lands are those lands which during a part of the year are in severality, that is, occupied severally by individuals as their own, to the exclusion for the time of other persons. The amount of common land in England is not known, but it is conjectured that about 8,000,000 acres: the total area of England and Wales is supposed to be about 37,000,000 acres.

The amount of land in England and Wales which is not inclosed is not known. The nature of those consumable and internized lands may be collected from the following instances. 'There are many parishes in the kingdom that consist altogether of common and internized lands; there are parishes in which the right of the common is sufficient to give an average size of 3 roods and 27 perches, and there are 352 old inclosures containing 677 acres. In the parish of Chelsey in Berkshire, the total contents of which are 2381 acres, there are 2315 pieces of open land, which although not entirely cultivated, give an average size of one acre.' This open land generally consists of long strips, which are so narrow that it is impossible to plough them across. Yet much of this land is the best in the kingdom for natural fertility, and is the oldest cultivated land. There is a great variety in these consumable lands; but they may be divided into three classes, exclusive of woodlands. First, there are open arable and meadow lands which are held and occupied by individuals severally until the crop has been got in. After the crop has been removed, that is, during the autumn and winter, it becomes consumable to persons who have the right of consuming the crop right in it, to consume it in their cattle without any limit, or without stint, as it is termed. Thus there is a divided use in these open lands: individuals have the exclusive right to the enjoyment of one or more of these strips of open land, of the part of the year; whilst another part of the year all these individuals enjoy this open land in common. Second, there is open arable and meadow land that is held in severalty during one part of the year, like the first class; but after the crop is removed, it is held not only to parties who have several rights, but to other classes of individuals: these lands are generally called Lammans lands.

These consumable rights may belong to a particular class, as a body of freemen, or to all landholders. There is great variety in these two classes as to the several rights held in. There are many cases in which the several rights change yearly by year. There are in these open lands what is called a pane of land, in which there may be 40 or 60 different lots. It is reported to be a remnant of an old military custom, whereby the best part of the land was taken possession of by any lot that he thought fit; if his right was called in question, he had to fight for it, and the survivor took the first lot, and so they went on until the parish. It often happens that in many counties, after 1800, in most parishes, it is said by another landowner that this year one this year goes round the whole of the several lots in rotation; the owner of lot one this year has lot two the next, and so on. When these lands are arable lands, they do not change annually, but periodically, according to the rotation of the crops. There is then the old lot meadow, in which the owners draw lots for the choice. There are a great variety of circumstances under which the several ownership of these lands shifts from time to time; but after the severalty ownership has ceased, and after the crop has been removed, they all become consumable.'

This is one among many instances of the existence of the same name or nearly the same name of several similar names of nations that we call barbarous. Tacitus (Germania, c. 26) says of the ancient German mode of agriculture, 'The lands, in proportion to the number of cultivators, which are all daily in the same land, divide among themselves according to their rank (merit). The extensive plains offer facility for division. They change the cultivated fields yearly; and there is still a suavity of soil. That was the meaning of Tacitus, as it is not clear. The following passage in Caesar's account of the Gauls (vi. 22) is more distinct: 'They pay no attention to agriculture, nor has any man a fixed quantity of land and boundaries of property; but the magistrates sometimes scatter colonies to them, and divide among them, as they please, and in the next year they compel them to move to another spot.' Herodotus (ii. 168) says that each member of the military caste in Egypt had a certain portion of land.
assigned to him; but they enjoyed the lands in a rotation, and the same persons did not continue in the enjoyment of the same lands. Strabo (p. 515) mentions a custom amongst the Dalmatians of making a division of their lands every eight years.

‘The third class is that of grazing lands, where the rights of parties are settled and defined, the ordinary stinted pasture. The lands are subject to a great variety of peculiarity; for instance, in some of these lands the right of grazing sheep at all belongs to a man called a flock-master, and he has the power, during certain months of the year, of turning his sheep upon or off all the lands of the parish; or, according to particular circumstances, his right is limited and restricted to turning sheep upon a certain portion of it, with a view to giving parties an opportunity of putting in a wheat in that quarter. In the same style there is a flock-master who has a right of depasturing his sheep during a certain portion of the year over all the land of the parish, it is clear that no one can sow any wheat without having made a bargain with him for shutting up his own particular fields, or some proportion of them.’

‘There is a very large extent of wood-land in this kingdom that is communable, strange to say, where certain individuals have a right during the whole year to turn on stock, the owner of the wood having no means of preserving his property except by shutting out other commoners’ stock by custom for some two or three years after felling. There is that right, as also that of the wood-keeper, which is a very great inconvenience, viz. where parties have the right of cutting house-bute, and plough-bute, and fire-bute, and so on in woods belonging, quid wood, to another party. There is a great deal of land subject to the operation of this ancient custom. There are many varieties of these communable lands, but these are the most prominent and remarkable of them.’

Under such a system as this, it is obvious that these common fields must be put to good use. The intermixed lands cannot be treated according to the improved rules of good husbandry. It is stated that the simple re-deposition of intermixed lands, now held in parcels so inconvenient in form and size as to be incapable of good husbandry, would in many instances raise the free-simelar value of the lands from 15s. or 17s. an acre to 30s.

This is the opinion of witnesses examined before the parliament of 1844, on Commons’ Inclosures, that judicious inclosure would make a large portion of common lands much more productive. At present open arable lands are so intermixed that effectual drainage is nearly impossible. One witness says: ‘I had occasion to go over two small properties, about 150 acres each; one I found in 301 different pieces, and the other is in a little more than a hundred. I mention these as showing the lands are so intermixed that they are therefore farmed at much greater expense; and it is impossible to drain them on the present improved mode of drainage, inasmuch as other parties are occupying the furrow by which the drainage is conducted. I should case off the lands, and make fish-ponds there, where there are these open arable fields, the course is two crops and a fallow, and every third year the flocks run over the whole field. The same witness considers that a fourth of the open arable land is at present totally unproductive. In cases where common arable fields have been sub-divided and allotted, ‘the great improvement is, that in the first place every man has his allotment, and he deals with it as he pleases; he drains it, and crops it upon a proper course of cropping; he puts it in seed and keeps sheep upon it: he grows turnips and clover, or whatever he thinks proper.’

The same witness is of opinion that the average improvement in the inclosed and cultivated fields which have been inclosed is not less than 25 per cent. Indeed the evidence that was produced before the committee establishes to a degree beyond what otherwise would be credible, the immense inconvenience and loss which arise from the system of intermixed lands, and their being also subject to commonage.

As to Common Rights, that is, rights of pasture and so forth on commons or waste lands, they are described generally under the heads of ‘General or Public Rights.’ At present, however, the commoners are entitled to this right of common.

Violent disputes also frequently arise in consequence of the rights of parties to commonage not being well defined. It is the opinion of competent judges that very great advantage would arise upon dividing these parties so that they were not worth inclosure; and that it would be in many instances highly desirable to inclose portions of a common for the purpose of cultivation, and to allot such portions of it, whilst it remains common, to the parties that would be beneficial to the commoners; or that cannot be brought into practical operation; and besides this there are many commons in gross. (Commons, Rights of, P. C.)

Inclosures of land have now been going on for many years. It is estimated that in 1850 there were 32,000 inclosure acts that had passed; and prior to that time about 1600 or 1700. It seems doubtful from the evidence whether the 1600 or 1700 comprehended all inclosure acts passed before 1800. Those inclosure acts (with the exceptions which will presently be mentioned) are private acts, and the expense of obtaining them and the trouble attendant on the carrying their provisions into effect have often prevented the inclosure of commons.

In 1836 an act (5 & 7 Wm. IV. c. 116) was passed for facilitating the inclosure of open and arable fields in England and Wales. The preamble to the act is as follows:—‘Whereas there are in many parishes, townships, and places in England and Wales open and arable fields, and waste and uncultivated pasture lands, and lands of the several proprietors of the same are frequently very much intermixed and dispersed, and it would tend to the improved cultivation and occupation of those lands to subject them to the use of the advantage to the proprietors thereof, and persons interested therein, if they were enabled by a general law to divide and inclose the same,’ etc. Inclosures have been made under the provisions of this act, the power which it gives are limited, for the ‘act applies solely to lands held in several during some proportion of the year, with this exception, that slips and balks intervening between the cultivated lands may be inclosed.’ The lands which cannot be inclosed under the provisions of this act are ‘the uncultivated lands, the lands in a state of nature, intervening between these cultivated lands, beyond those that are fairly to be considered slips and balks.’ However, it was stated in evidence before the committee of the House of Commons in 1844, that a large extent of common and waste land has been illegally inclosed under the provisions of the act, and the persons who hold such lands have no legal title, and can only obtain one by lapse of time. The chief motive to this dealing with commons appears to have been, that they thus got the inclosure done cheaper than by application of the provisions of the act.

In 1814 a select committee of the House of Commons was appointed ‘to inquire into the expediency of facilitating the inclosure and improvement of commons and lands held in common; and the effect of the intro- duction of mixed lands, and into the best means of providing for the same, and to report their opinion to the House.’ The committee made their report in favour of a general inclosure act, after receiving a large amount of evidence from persons who are well acquainted with the subject, the evidence that has been given in this article are from the printed evidence that was taken before the select committee.

In pursuance of the recommendation of the committee, an act of parliament was passed in 1845 (8 & 9 Vict. c. 118), the object of which is thus stated in the preamble:—‘Whereas it is expedient to facilitate the inclosure and improvement of commons and other lands held in common; and other lands being subject to commonage, it is expedient to provide remedies for the defective or incomplete execution, and for the non-execution of powers created by general and local acts of inclosure, and to authorize the proprietors or occupiers of such lands to be entitled to the services of all the commoners in the common, the rotation of all the commoners in the common is not within the scope of this article to attempt to give any account of the provisions contained in the 160 sections of this act; but a few provisions will be noticed that are important.

The 11th section contains a comprehensive description of lands which may be inclosed under the act; but the New Forest and the Forest of Dean are entirely excepted. The 14th section provides that no lands situated which were
the courts of justice and police establishments, in the forms of judicial procedure and laws, due regard being had to the distinction of castes, difference of religion, and manners and opinions prevailing among different races, and in different parts of India. The ground work on which India is placed in the same system of laws as the native population, the influence of the opinion of the former in the administration of justice will prevent abuses to which the latter might be exposed without having the opportunity of urging their complaints in this country. Mr. T. B. Macaulay was the chief member of the first commission. The report of a penal code was presented to the Governor-General on the 15th of June, 1836. The groundwork of it is that it is not drawn from any system of law in force in India, though compared with and corrected by the practices of the country. The principles of the British law, the French code, and the code drawn up by Mr. Living- stone for the State of Louisiana, are the foundations of it. Most of the articles which it contains are accompanied with illustrations to facilitate the application of the law, and it is thus a statute-book for a collection of decided cases. This report was signed by Miers, Macaulay, J. M. Machener, G. W. Anderson, and F. Millet. The progress of the present commissioners in dealing with the general law of India has not been published. (Penal Code, Parliamentary Paper, 1838, No. 673.)

INDUCEMEN[. [MARKING, P. C.] INFAMITY (from the Roman Infamia) in English law is not easily definable. As it has no established definition of itself, so that conviction and judgment for such offences rendered a man infamous and incompetent to be a witness. But the endurance of the punishment, or reversal of the judgment, may destroy the effect of conviction, and so render a man not infamous. When a man convicted of felony has undergone the legal punishment for it, the effect shall be the same as a pardon under the Great Seal; and (§ 4) no misdeemeanour, except perjury or subornation of perjury, shall render a man an incompetent witness after he has undergone his punishment.

The 6 & 7 Vict. c. 85, enacted, that no man shall be excluded from giving evidence, though he may have been convicted of fraud in the purchase of a horse, or horse-dealer, taking and making any bribe, are for ever incapacitated from voting at the election of members of parliament. They are therefore infamous: they labour under infamy: and have lost part of their political rights.

The Roman term Infamia is the origin of our term infamy. Infamia followed in some cases upon condemnation for certain offences in a judicature public and in other cases it was a direct consequence of the act, as an accessory. Among the cases in which Infamia followed upon condemnation, were, insolvency, when a man's goods were taken possession of by his creditors in legal form and sold; the actio furii, and vi honorum raptorum; actio fiduciaria, pro socio, tutelae, &c. In all these cases a judicial sentence, or something analogous to it, was necessary, before Infamia could attach to a person. Among the cases in which Infamia was followed as an immediate consequence of acts which were notorious the following: the case of a woman caught in adultery, of a man being at the same time in a relation of a double marriage, of prostitution in the case of a woman, or when a man or woman is a living aid in prostitution. The consequence of Infamia was incapacity to obtain the honours of the state, and probably the loss of the suffrage also; and it was perpetual. The Infamia was still a citizen (sive priva), but he was disfranchised in his political rights. The infamous man was also under some disabilities as to his so-called private rights. He was limited by the Prator's edict in his capacity to postulate that is, to take the initiative measures for preserving or defending his rights in legal form, and of an attorney of another in such cases, to be a witness, and to contract marriage.

The rules of the Roman law as to Infamia are chiefly contained in the Digest, iii, tit. 1 and 2.

INFANT HEIR. [HEIN, P. C.]
INFANT TRUSTEE. [TRUSTEE, P. C.]
INFANT WITNESS. [Acet, C. G.]

INFECTION, in the law of Scotland, from the same origin as the English term feoffment, expresses the ceremony by which a person succeeding to another by descent, settlement, or conveyance, is invested in any heritable or real property. Down to the year 1845 this ceremony was as pure a feudal usage as it ever had been in the days when the almost universal inability to write suggested symbolical modes of charging the mind. Suppose in a common case—that a man purchases a piece of ground from one who holds it of a superior. According to the system of sub-infeudation preserved in Scotland, he may either be put in the seller's place and hold of the same superior, or he may hold a sub-feu under the seller. Whoever is to be the superior, the title deed contains an authority from him to invest the vassal. Until the late change, a number of persons had to proceed to the ground, consisting generally of the attorney who prepared the titles, and his clerks, who had the following parts to act. One was the bailiff of the superior, and a commission authorizing him to act in that capacity was read over. Another party acted as the procurator or representative of the vassal, in whose name the bailiff lifted some fragments of earth and stone from the soil and handed them to the procurator, as symbols by which, according to the authority given to him, he made over possession of the property to the new tenant. The symbols of this ceremony then placed a coin of the realm in the hands of another party, who must have been a notary public—this being the form in which a protest is taken in the hands of a notary in Scotland. Two other persons, scotsmen, and in the ceremony, with this authority on which it proceeded, was narrated in a deed called an instrument of sajine, in which the notary publicly attested the transaction. The preservation of this cumbersome ceremony down to a later age was owing to its connection with the admirable system of registration which has kept the commerce in real property in Scotland on so clear and secure a position.

The whole ceremony went for nothing unless the instrument narrating it were recorded in the Register of Sases within sixty days after the ceremony. The registration was and is the criterion of preference. If land should be sold or mortgaged to any number of different people, the person whose sais is first registered has the absolute title, and all questions as to the fairness of the transaction, are pecuniary questions to be settled apart from the title to the lands. The cumbersome ceremony mentioned above was rendered no longer necessary by the 8 and 9 Vict. c. 55, passed 21st of July, 1845, and called 'An Act to simplify the form and diminish the expense of obtaining infente in heritable property in Scotland.' It simply provides that 'it shall not be necessary to proceed to the ceremony of being given,' or to perform any act of infente thereon; but saisine shall be effectually given therein and infente obtained, by producing to a notarypublic the warrant of saisine and relative writs, as now in use to be produced. The act itself being infente is not to be kept for recording * * * an instrument of saisine, setting forth that saisine had been given in the said lands, and subscribed by the said notary-public and witnesses.' There has been little opportunity of observing the working of this act; but it is expected that it will materially reduce the expense of transferring interests in landed property in Scotland. A costly ceremony and a long deed, essential to the durability of every title of a new holder, are abolished by it. The act at the same time contains some methods of remedying mistakes and omissions which under the old law were fatal flaws.

In Scotland an infente is defined to be an information or procures any person in the King's courts for an offence against the law or a penal statute. Such a person is generally called a common informer, because he makes a bargain for it. Without any notice or pretence of public interest, he who makes the offender known does the public a service. But the business of a common informer is looked on with dislike, and he who follows it is generally passed over with the apologies for ignorance which is given by modern editors. The informers is generally such that they deserve all the odium they receive. They stand in a like situation to the common

hangman. This dislike of informers, simply as such, is one of the absurdities which are contributed to the real foundation of the dislike however among those who can form a just judgment of things is, not the act of information, but the devices, tricks, and meanesses to which a man must resort when refused, to know the facts which the informa-
tion must be founded. It is the same principle which often leads us to condemn a man for making certain statements in public, not because of the statements, but because of the means by which he may have obtained his knowledge. When a penalty is too heavy, or when the law that imposes it is generally disliked by the people for any reason, good or bad, the popular dislike finds a definite object in the informer w4, giving effect to the policy of law that made the penal law is overlooked, because the legislature is a number of per-
sons; the informer is one, and his agency is seen and felt.

In absolute governments there are spies and political in-
formers, who are the tools of a government which has no rule but its own pleasure. Some people have been dull enough to confound all informers in one class; not seeing that there is a difference between an informer who helps to give effect to the law, and an informer who helps a tyrannical govern-
ment to entrap and punish persons suspected of disaffection to the government or of designs against it.

INFUSORIA, FOSSIL. The geographical distribution of living infusoria seems to be affected by the temperature of reproduction, and the facility of diffusion through water and air, which belong to these microscopic creatures. Fre-
quent in all the varieties of water which have been exposed to the influences of air and sunlight, they are particularly fond of the extremes of terrestrial temperatures, not absent even from snow, ice-covered streams, or the ejections of volcanoes, they have been recognised in all the regions of the globe. Lakes, rivers, and seas, are alike the repositories of these strange inmates of the smaller worlds. In the extreme geological periods of Cainozoic and Mesozoic formations.

The source of the siliceous matter, which enters the organi-
zation of the infusorial races, is not difficult of discovery. Most of our fresh waters contain silica, though not in abun-
dance, derived, it is probable, from the decomposition of felspar and other mineral silicates. Silicate of soda and sili-
cate of potash, thus occasioned, may by intermediate vegeta-
tive processes yield the silica in a state suitable for being organically solidified. Experiments on this subject, which may be easily made, are quite satisfactory in showing that silica can be produced by infusorials (such as express silica, generated in a few days in a sandstone trough, supplied with water and decaying vegetation. The animalcula being dried on the field-glass of the microscope, their beautiful transparent sili-
ceous crusts in the species known as saccharina, from the canic foci, silica is dissolved abundantly, and it is necessary to keep this fact in view while considering the extensive fleshy beds in chalk, the thick Potterschierer beds of Bilin, and other analogous edges of silicified organic remains. These deposits of marine and fresh-water races, which run through all the larger animals and plants with such regularity as to be termed a law of nature, obtains also, but less absolutely, in the in-
musoria, on the less elevated races of the same kind, in many at the junction of rivers with the sea. By comparing the living oceanic and lacustrine races on a large scale, enough
of difference appears in their steneous shields to authorize conclusions more or less positive as to the marine or fresh-water origin of infusorial deposits, which contain identical or analogous forms belonging to earlier periods. Thus the rich deposits of Richmond in Virginia appear to have been formed beneath the sea; the famous deposits of Bohemia, Berlin, and Santa Flora contain admixtures of marine and fresh-water tribes; while those of Bare in the county of Down, and Gainsborough and Bridlington, contain a more considerable proportion of fresh-water species.

Infusoria of marine or estuary origin have been found in a fossil state very extensively in Europe, Asia, Africa, and America. Ehrenberg has described many species from Greece (Zante and Egina), Italy (Caltanissetta and Catanzaro), and Africa (Oera), which occur in calcareous marls, referred by Ehrenberg to the age of the true chalk deposits. These deposits are very extensive in Africa, occupying the whole coast of Oran and large tracts in Egypt and Arabia. Portions of this tract have, however, been described by M. Rozet as tertiary. In the undoubted white chalk of Denmark (Rügen), of France (Meudon), of England (Gravesend and Brighton), infusoria also occur, but less abundantly. North America has yielded a great variety of marine or partly marine infusoria, especially at Richmond and Petersburg in Virginia, at West Point, in Connecticut, Rhode Island, Massachusetts, and Maine. Brazil has also yielded similar deposits.

Infusoria partly of marine and partly of fresh-water origin have become familiar to us in the Polierschiefer (polishing slate) of Bilin and Planitz in Bohemia, and in the Haischwald near Cassel, the Bergmeili of Santa Flora in Tuscany, the white marl in the peat of Fransenbad near Egra in Bohemia, the peat deposits of Gainsborough in Lincolnshire, and at the base of the Mourne Mountains in Ireland. We find them to occur also in considerable plenty, but in limited distribution, in the lacustrine deposits of the East coast of Yorkshire. The Isle of France is added to these localities by Ehrenberg, and New Zealand by Mantell, all the occurrences belonging to supra-tertiary areas.

Infusorial remains are very unequally congregated. The siliceous marl (Kieselschiefer) of Fransenbad consists mainly of Navicula viridis (fig. 6) (now recent); that of the Isle of France, of Bacillaria vulgaris (fig. 7); that of San Flora, of Syndra capitata (fig. 9); while that of Bilin is composed of Gallonella distans (fig. 8) almost exclusively. (Ehrenberg.)

Infusoria are mentioned in the moya (volcanic mud) of Mexico, and in the edible clay of the Amazon River, by Ehrenberg; in the rock salt and the marl which accompany it at Carlsina in Spain, by Marcel de Serres; they are assumed by Ehrenberg to enter largely into the composition of flint, which indeed readily shows Xanthidium and Pyxidium. The bog-iron ore (Raseneisenstein) common near Berlin is composed chiefly of Gallonella ferruginea. A kind of semioil lying in nodules in the Polierschiefer of Bilin is composed of the same siliceous reliquiae (Gallonellae), as the true polishing slate, but they are cemented together and filled by infiltrated silicious paste. With the Gallonella Ehrenberg finds spicula of sponges. The precious porphyry opal of Kaschau, and the serpentine opal of Koesnitz in Silesia, has appeared to Ehrenberg of analogous composition. The following tabular view given by Ehrenberg of some of these facts will be useful:—

1. Bergmeili
2. Kieselschiefer
3. Polierschiefer
4. Sauschierer
5. Semioil of Polierschiefer
6. The above consist entirely or partly of the shells of Shield-infusoria.
7. Semioil of the Dolerite
8. Precious opal of the porphyry
9. Flint of the chalk
10. Gelberde (yellow earth)
11. Raseneisenstein
12. Certain kinds of Steinmark, investing the opal of Kaschau.

The above are probably of the same nature. As examples of undoubted marine infusorial fossils we give below figures of some of the forms most frequent in a white deposit from Richmond.

These are tertiary forms, and below is a specimen of a group referred to the recent genus Xanthidium, and frequent in the flint nodules which occur in chalk.

11. Xanthidium remorum.

Last of species of infusoria from the Kieselschiefer of Fransenbad.—Navicula viridis (plentiful), N. gibba, N. fulva, N. libris, Gomphonema paradoxum, Gomphonema clavatum (fresh water species now living near Berlin); N. viridula, N. atrium (now living in the sea, the second also lives in the Carlsbad water); Gallonella varians.

Species of infusoria in the peat bog of Fransenbad.—Eunotia granulata (plentiful), Navicula viridis (rare), Bacillaria vulgaris, Cocconeis uidentula, Gomphonema paradoxum.
Species which occur in the Kielgauhr of the Isle of France,—Bacillaria vulgaris? (plenteful); B. major, Navicula fulva? N. gibba, N. bifrons (living near Berlin).

In the Bergmehl of Santa Forn.—Synedra capitate (plenteful); this are S. ulna (living both in fresh water and the sea); N. navicula, N. capitate, N. viridis, N. gibba (fresh water species); N. viridula (living in Baltic); Eunotia granulata, Navicula folia (extinct); Cocconeis undulata (waste); Chaetoceros pseudonutum, G. clavatum, G. acuminatum (living near Bremen); Cocconeis cymbiforme (fresh water); Gaillonella italic; Specia of sponge or spongiophile.

In the Pelleneschiefer of Bilin.—Podosphasia nana (plenteful), Gaillonella distans, Navicula scalarum, Bacillaria vulgaris? (probably all marine).

In the Leaf Tripoli.—

Gaillonella distans (plenteful), Podosphasia nana, Bacillaria vulgaris? (probably marine).

At Bann, in the county of Down, Captain Portlock found under peat, Navicula, Bacillaria, Eunotia, with fragments of achnanthes and conocephale. (Microscopical Journal, 1841.)

At Gainesborough, Mr. Binney found under peat, abundance of Gaillonella. At Brillington, we have observed in white and brown marls, Eunotia serrata? Bacillaria vulgaris, Navicula inquinata, N. viridis, N. phegini, N. phegina, N. cintata, a new and beautiful Campillosidis (C. times), &c.

The North American localities have yielded to Bailey and Ehrenberg a large catalogue of infusoria. Ehrenberg enumerates—

Amphiphora—two species. Cocconeis—two species.
Eunotia—seven species. Fragillaria—three species.
Gaphne—four species. Himantidium—one species.
Navicula—eighteen species. Stanwellia—two species.
Tabellaria—three species.

With these are three forms of spongia and spicula, and two species of Thyridiales.

These are mostly derived from beds lying under peat.—The Richmond earth (of miocene date) yields—

Coscinodiscus radiatus and other species (fig. 3). M. Queckett has found several of these recent in the North Sea. Mr. Lee has discovered Coscinodiscus and Dictyochae in the barnacle and scallop.

Actinocyclus coenobitis and others (fig. 3).

Navicula, several species

Gaillonella

Dictyochae fulva (fig. 1).

In the chalky marls of Oran, Sicily, Greece, &c. occur many living forms, as—

Frustularia rhabdosoma—Grassevend.

Striatula—Grassevend.

Gaillonella auriculae—Bügeln.

Peridinium pyrophorum—Grassevend.

Xanthidium furcatum—Grassevend.

hirsutum—Grassevend.

Dr. Mantell has been unable to discover Frustularia in the chalk of Graevesnet, but Xanthidium occur in the chalk of Dover. (Ann. Nat. Hist., Aug. 1845.) Gaillonella auriculae has been regarded as an Oscillatoria; and it appears doubtful whether the so-called Xanthidium of the flint and chalk are really to be referred to as fresh-water genus.

From the preceding notices we may gather as general facts the occurrence of infusoria remains in the following strata:—

Recent Fluvialite and other sediments. Lacustrine deposits of the Elbe period. Deposits of the *Lehm* period.

Cainozoic period

Mesozoic period

Oolitic deposits.

The relative abundance of the Infusoria in these several deposits is so great that their absolute numbers are really the same as those in the recent oceans, and that the relative abundance of the Infusoria is the same as in the Recent oceans (paleontological). It is true that Ehrenberg, by assigning to the cretaceous era the calcareous marls of Oran, Sicily, and Greece, gives a parallel to the Recent oceans, and that the facts that in the favour of such reference of those marls are the Rotalia, Textilina, &c., which occur both in the true chalk and in such marls. But on the other hand, remembering the long scale of geological time through which these genera of Polythalamia extend, and taking into consideration the fact that some species which occur in the chalk of Europe are quoted by Ehrenberg from unquestionably miocene strata in America, we shall hesitate to admit those truly infusoria marls as truly coeval with the white chalk in which comparatively very few remains of the group occur, and these not of the same species as those which occur in the other deposits.

Another point on which the authority of Ehrenberg has not been received without hesitation, is the absolute specific identity of a large proportion of the fossil and recent infusoria.

The most curious discoveries of geology had prepared an easy admission for the opinion that many of the tertiary forms of infusoria were undistinguishable from living races; so is the fact in regard to all the invertebrate races; but with very few, and those always allowed, exceptions, the secondary strata had been found to contain only extinct forms of life, till Ehrenberg examined the minute Polythalamia and found many of them similar to living types, and confirmed this inference by independent researches among the infusoria.

Supposing these opinions of the Prussian microscopist to be confirmed by future inquirers, we shall find that they involve no inference of the relations of zoological forms to geological time, and that they have been established from examinations of the other classes of the animal kingdom. The systems of life in each successive system of strata are not separate and distinct creations, but successive terms of a creative series; each of these terms is compound, and (to speak exactly), its constituent quantitates (the several classes, orders, families, genera, or species) have their own coefficients and exponents; that is to say, have their own times of duration, their own periods of abundance, their own peculiar relations to earlier and later organisations.

A rule drawn from Fishes cannot be applied to Mollusca, a law based on Crustacea cannot be received for Microzoa, without previous examination; and Palaeontology is full of examples of the unequal periods of duration which belong to the different organizations, and the unequal degree of development, and unequal geographical diffusion, which characterise these organizations at the same epochs and during the same periods.

Admitting the authority of Ehrenberg's determination of species, we find another curious and unexpected result—the frequent, if not general, admixture of marine and fresh-water tribes—in the comparatively level regions of Europe. In the plains of North Germany, round the Bohemian and Harz mountains, in Tuscany, and Yorkshire, we find this admixture of supposed marine and supposed fresh-water races, in the supra-tertiary deposits. Is this to be explained by supposing those deposits to have happened while the relative level of land and sea was different from what it is at present, and the sea was near to the place of deposition, so that by some of the many natural modes of diffusion which are effective in this class of life, the organisms of the sea might be carried into lakes, as well as mixed in estuaries, and along the course of languid rivers? Probably so. The deposits of infusoria which now happen so abundantly at the mouth of the Elbe are mostly derived from the sea; and it is highly probable that the fresh-water species which we imagined to be truly marine live in juxtaposition with the species of fresh waters. There may probably be, in a class of beings associated with alluvial waters, a greater independence of species, and more time to distinguish the species which have little need of silica, and which require the extrication of lime from a state of solution in the waters which they inhabit. In confirmation of this view, we find the
spangle of the sea matched by the spangle of fresh water, each extracting alien from the liquid, but the caudacious Physiological Subjects, by the result of their observations, is almost unrepresented in our inland lakes and streams.

(Heubner, Die Infusionshistorien; Mem. of the Berlin Academy, and Translations in Taylor's Scientific Memoirs; Readings, in 1790, "Papago Indians," etc.)

INGEN-HOUSZ, JOHAN, a distinguished natural philosopher, was born in Belgium in 1738; for some years he practised medicine in that city, and employed his leisure in the performance of experiments in chemistry and electricity; but, at length, quitting his native country he came to London, where he was employed in the branches of science so actively engaged in by the notice of the English philosophers, and led in 1769 to his being elected a Fellow of the Royal Society. He had the good fortune to obtain an introduction to Sir John Pringle; and this celebrated physician, immediately appreciating his merits, warmly encouraged him in the prosecution of his researches, and honoured him with his esteem and friendship; he also frequently had corresponded with Franklin on the subject of electricity, which was, at that time, rapidly rising in importance.

The reputation of Ingen-housz as a physician must have been considerable, for the Empress Maria Theresa, who had lost two of her children by the small-pox, having directed her ambassador in London to consult Sir John Pringle respecting the choice of a physician whom she might invite to her court for the cure of her two remaining children, and in the person of the imperial family, Sir John, then president of the Royal Society, without hesitation recommended Dr. Ingen-housz: the latter, accepting the invitation, set out, in 1772, for Vienna, where he performed the operations with complete success. The example of the sovereign was followed by the nobility of Austria, and the children of the highest families of the country were inoculated by Ingen-housz or under his immediate direction. In testimony of her sense of his merit and attention, gave him the title of auspice councillor and imperial physician; and accompanied these honours with the grant of a pension, which he enjoyed during the rest of his life.

During his residence on the continent, Ingen-housz visited Italy, France, and various parts of Germany; and, at intervals, continued to prosecute his researches in electricity and magnetism, and on the air produced by plants. While at Vienna, the emperor Joseph II. honoured him with special notice, inviting him frequently to the palace, and occasionally visiting him at his own house. In order to witness the performance of his philosophical experiments. During a visit to Italy in 1773, Dr. Ingen-housz had an opportunity (at Leghorn) of making some experiments on the torpedo: he found that the electric fluid was absorbed by the body and that when he attempted to bend its body; these shocks were sometimes so strong that he was almost obliged to quit his hold, and he remarks that they resemble the discharge of a number of sable nettles.

After an absence of several years, Dr. Ingen-housz returned to England, where he continued to prosecute his experiments; and an account of an electrophorus, which he had invented, is described in the 'Philosophical Transactions' for 1778. About the same time he made the discovery that plants exposed to the light while growing, discharge oxygen gas from their leaves into the atmosphere; and an account of his researches relating to this subject was published in London in 1779 under the title of 'Experiments upon Vegetables, developing the power of purifying the Air in the Sunshine and of injuring it in the Shade,' etc. The work was translated into French by the author and published in Lauenburg in 1780.

In the 'Philosophical Transactions' for 1779, there is an account of an electrical machine which, about that time, Dr. Ingen-housz had constructed; this consisted of several pasteboard boxes of a large size, which, when covered with varnish were fixed upon a axis; between every two of them was a board covered on both sides with flannel and then with hare's skin; and the friction produced when the boxes were revolved caused the discharge to obtain from the machine sparks above a foot in length. This probably led to the invention of the plate electrical machine, which is generally ascribed to Ingen-housz, though it was composed of two cushions, forms a very elegant and, if made of considerable magnitude, a very powerful apparatus.

P. C. S. No. 33.

Dr. Ingen-housz published in English a work entitled 'New Experiments and Observations concerning various physical bodies.' He was elected a member of the Royal Society, and lived in Paris. He also published, in French, a work entitled 'Essai sur la Nourriture des Plantes,' which was translated into English and published in London in 1798.

(1) Ingen-housz, in Sept. 1790, married a country-house, near London, in the sixty-ninth year of his age.

(Biographie Universelle; Philosophical Transactions.)

INHIBITION, in the law of Scotland, is a writ by which a creditor may prohibit his debtor from alienating property either to favoured creditors or to other persons. Nominally it affects all property, but it is only in the case of heritable or real property that, from its standing on the register, it is efficacious. The effect of the act is generally to prohibit any act which must be founded on some obligatory written document, or estab-

lished by the decree of a court. It may be recalled if improperly awarded. It conveys no specific security to the person who holds it, but it gives him a right to impugn any act which the debtor does to his prejudice regarding his real estate. It does not affect the validity of a sale for a fair price, but it gives the inhibitor a right to the purchase so far as his debt extends. If the inhibition be followed by proceedings to attach the estate at the instance of the other creditors, the inhibitor has a preference over them if the debts have been incurred solely or chiefly to the injury of one of them.

The mixed rights thus occasioned are often productive of very intricate questions.

INJURY, INJURIES. As these words are vaguely used, it is as well to state the meaning of the word used by Blackstone, after treating of Rights, proceeds in his Third Book (c. 1) to consider the wrongs that are forbidden and repressed by the laws of England. He then divides Wrongs into two sorts or species:—Private wrongs and Public wrongs. To Private wrongs he also gives the name of Civil Injuries, as being 'the infringement or violation of the private or civil rights belonging to individuals considered as individuals.' Public wrongs are 'a breach of public rights and duties,' and are distinguished by the harther appellation of Crimes and Misdemeanours.

This is a confused statement. The true nature of Injury is however contained by implication in another expression in Blackstone --- 'the contemplation of what is Jus is necessarily prior to what may be termed Injury.'

The English law has in fact adopted many terms of the Roman law; and if Blackstone had always traced their meaning correctly, he would have written less confusedly. As Jus is law, so Injury is something that is not Jus, or is forbidden by Jus. An Injury then, in the English law, is some illegal act; but the word is commonly used to express an illegal act done to a man or his property, for which he may by legal process get compensation. The English legal maxim that a damages must be proportional to the compensation which is given for a damnum absconditum, contains in it the true meaning of injury or injury. The act must be an illegal act in order to entitle a man to compensation. If a man's acts damage the property of another, or even the body of the person himself, and the person who is damaged can get no compensation. For instance, a man may set up a grocer's shop next door to another shop, and get all his neighbour's custom, which is a grievous 'damnum,' but no 'injury.' It is true that the nature of the damage may in some cases help to determine whether it is a legal injury or not; but the true question always must be whether the act complained of is either an common law or by statute an unlawful act.

The Roman word Injurias, as already observed, signifies generally anything which is done contrary to law (quod non jure factum est, hoc est contra jus). In its narrow sense, Injurias was limited to unlawful acts that affected a man's person, not his property, at least not directly. It comprehended personal violence, such as beating a man, and using abusive words to him, and libelling a man. Injuries might also be inflicted by virtue of a thing to which another was a possessor of those who were in his power, as his children and slaves, or in his hand (manu), as his wife. The mode of proceeding was by the Actio Injuriarum. (Gombrich).

The nature of wrongs or Injuries in its limited sense is, therefore, it appears, different from that of Injury in English law, as properly understood. For Injuries in English law, as Civil Injuries, a man could sue in Blackstone's time, comprehended all the wrongs that are treated of in his Third Book, that is, all wrongs except Crimes and Misdemeanours. The Roman Injurias belongs both to the head of Law Criminal

VOL. II. — M
and Non-Criminal. In some cases damages were got in
the form of a fine, and in his person: in some cases he might be punished by a pecuniary penalty and in his
person also.

The common, the non-legal, use of the words In-
juries and Damages is a popular notion of Right and
Wrong generally. But people have often a clear per-
ception that a damage is done for which no compensation
can be got by legal means, though compensation is due ac-
cording to the popular principles in which the common notions of right and wrong are based. The popular judgment here is often right, and is a foundation on which good and efficient legislation can be securely based.

The inability of inquirers for the safe custody of the goods and chattels of their guests is one out of the numerous classes of cases that arise upon the law of bail-
ments, and is placed by Sir W. Jones, in his Treatise, under the second subdivision, Locatio Opera, of the general head Locatum. The law makes the inkeeper responsible for the safety of the goods of persons coming to his house, in the language of the ancient writ, causai hospitali; but he may be released from his liability either by inattention on the part of the guest to such reasonable rules as the inkeeper may think proper to lay down for the protection of the property of the guest himself, or by his making use of the house not as it is before said, causai hospitali. Thus, if an inkeeper requires his guest to put his goods under lock and key, and the guest leaves them in a passage, whereby they are lost or stolen; or the goods are stolen by the guest's own servant; or the guest uses his room in the inn as a show-room, into which a number of people are allowed to have access, and not as a lodging-room, the inkeeper is not responsible for the loss of the goods. The interest seems to require that the law should be made still more strict as against inkeepers, as the good faith and responsibility of the inkeeper form the only security of the traveller. The Roman law on this subject is contained in the Digest iv, tit. 2.

(Smith's Leading Cases, ' Calye's Case'; Treatise on the Law of Bailments, by Sir W. Jones.)

INSANITY. Insanitas, P. C. 8 J.

In inscriptions (Inscriptiones) that is, records of public or private occurrences, of laws, decrees, and the like, engraved on stone, metal, and other hard substances, exhi-
bit ed for public inspection. The custom of making inscrip-
tions was infinitely more general in the states of antiquity
than in any modern country, as we see from the innumerable inscribed monuments which still exist in Persia, Egypt, Greece, Italy, and other countries subject to or colonized by the Greeks and Romans. A great number of inscriptions, especially those recording great events, laws, or decrees of the government, which it was important for every citizen to know, supplied to some extent the want of the art of printing. While the absence of the laws of the state was sometimes, in the days of the Roman emperors, set up in public, this public exhibition was equivalent to their publication by means of the art of printing, for every Roman might go and read them, and, if he liked, take a copy of them away with him. Therefore it is not surprising that the art of printing, inscriptions set up in a public place were the most convenient means of giving publicity to that which it was necessary or useful for every citizen of the state to know. Inscriptions therefore are, next to the literature of the an-
tiquity, the most important sources from which we derive our knowledge of their public, religious, social, and private, and their study is indispensable to the inquirer who desires to become intimately acquainted with the history of antiquity.

For the history of the languages they are of paramount im-
portance, since in most cases they show us the different modes of writing in the different periods, and exhibit to us the lan-
guages in their gradual progress and development; though it is manifest that the antients did not bestow that care upon the accuracy of the language and orthography which we might expect, and in many cases they seem to have left those things to the inquirer who executed the inscription. After the over-
throw of the Roman empire in the west, inscriptions still con-
 tinued to be made very frequently; but as the ignorance of the languages became more and more confined to the priesthood, the custom of making certain things known by means of inscriptions gradually fell into disuse, until the art of printing did away with it almost entirely.

In order to render inscriptions as permanent as possible, the antients chose such materials as were least subject to de-
struction, viz. stone or metal. The stone most commonly
used was marble cut in slabs, but sometimes inscriptions were wrought upon a flat surface of the same stone. The most usual metal was brass or bronze, though we have instances also of lead, tin, and gold being used. If we believe the accounts of the antients, inscriptions were made even in the mythical ages (Hesiod, Theog. 84, 8; Hesiod, Works and Days, 11, 1), but such inscriptions, existing in later times, were probably forgeries, and we cannot suppose that inscriptions were made until the art of writing was very generally known.

We also have inscribed monuments of Persia (Arabische Characters, P. C.), the hier-
oglyphics of Egypt, and the now unintelligible inscriptions of Etruria, Lycia, and other countries, and confine ourselves to those which relate to Greece and Latin.

Greek Inscriptions.—The earliest Greek inscriptions which we may safely take to have been genuine, but all of which have perished, were the lists of the victors in the Olympic games (Paus. iii. 21, 1; v. 4, 6, &c.), the records of the musical contests at Spicon (Plutarch, De Mus., 3, 8), and the chronicle of the priesthoods of Hera (Junon) at Argos. The earliest among the extant inscriptions do not seem to have been made much before the year n.c. 500.

All inscriptions are composed either in prose or verse, but the former compose by far the greater number. The prose of the inscriptions is very much like that of prose writing in general, and is unlike that of official documents of our own time. All Greek inscriptions are written in capital letters, and without any punctuation or separation of the several words, which often renders the reading difficult. Some inscriptions are written in the characters phaenomenon, some in the characters bombycida. Some of the earliest inscriptions are written, like the Hebrew, from the right to the left; others varied their lines, the first being written from the left to the right, and the next from the right to the left. But besides these general distinctions, there occur a great variety, and some modifications of writing which are the result of mere fancy. Another important point which it is necessary to know before attempting to read Greek and Latin inscriptions is the difference in the use of names and words (sigla), which have been described and explained in several works, such as Nicolai, ' De Sigilis Vetricurn,' Lugdun. 1703, 4to; Maffi, 'De Graecorum Sigilis Lapidaria,' Verona, 1746; E. Corini, 'Notae Gramm.,' Florence, 1749, fol.; Placentinus, 'De Sigilis Vetricurn,' Rome, 1757, 4to.; but the best work on this subject is Franz, 'Elementa Epigraphiae Graecae,' Berlin, 1840, 4to., which is at the same time the most complete introduction to the study of Greek inscriptions.

Public or state documents were exhibited in Greece in cer-
tain places of great publicity, as the Aeropoli at Athens, and the agora at Corinth. The same was also the case with receiving marble or metal slabs with inscriptions. Market-
places and temples likewise served as repositories for inscrip-
tions. When it was intended that an inscription should be permanently engraved on stone, a certain form of the art of engraving was invented. The oldest languages of both (inscriptiones bilungiae), as in Greek and Assyrian (Herod. iv. 87), Greek and Palestinian (Gen- semia, Mommsen, Phoenic., i. p. 98, &c.), Greek and Latin, Greek and Lycian (Grotefend in the Transactions of the Royal Society, i. 2, p. 317, &c.), and Greek and Egyptian, as on the Rosetta stone in the British Museum, of which another copy has recently been discovered by Layard.

The necessity of making collections of the most important inscriptions, such as contained public decrees, or interesting epigrammatic poems (of which many have found their way into the Greek Anthology), was felt by the Greeks themselves. The earliest collection we know of is that of Philochorus, under the title of 'Eγγραφα μιας Αυταίρ; ' his example was followed by Polemon in a work Περί τῶν κατὰ Πόλεις Εγγράφων, and especially by Craterus in the important collection en-
titled Συναγωγή Θερμα'ων. Although public inscriptions were under the protection of the state, and although their violation was severely punished, we nevertheless know of books of inscriptions that were either destroyed or mutilated in certain cases. The state itself ordered the destruction of public documents, as when decrees were annulled or abolished. In times of war and in the destruction of cities, innumerable inscriptions were perished. Athens, as early as the time of the Persian wars, gives us an example of the destruction of public monuments, as pillars, and inscriptions with inscriptions, for the purpose of
building walls for the protection of the city. In the fourth century of our era religious fanaticism caused great destruction of monuments which were frequently used as building materials for all kinds of edifices; and if, in addition to all this, we consider the ravages of time and the accident of war, it is not surprising that the immense number of inscriptions that have been preserved down to our own time.

The first modern writer who conceived the idea of making a collection of all ancient inscriptions, or at least of the greater part of them, was, as far as we know, the learned Mr. Hamilton, who undertook, in a.d. 1430, a journey through Italy, Greece, and Asia Minor, and brought back a great number of inscriptions, which he collected in 3 vols. MS., which are still extant and in the library of Leiden. Mr. Hamilton's labours have often been used by subsequent collectors. After Cytinus a long time elapsed, during which the attention of the learned was chiefly directed towards Roman inscriptions. Scipio Maffe, and after him J. Caracci and T. M. Rapou, formed the plan of a complete collection of all inscriptions, but none of them were able to carry it into effect, and people were satisfied with books containing such inscriptions as their authors happened to meet with, or thought of particular interest. Works of this kind are:—Janus Gruter, 'Inscriptiones Antiquae totius Orbis Romani,' Heidelberg, 1602, 2 vols. fol.; 'Marmora Arunsiana' (also called 'Oxonensia,' containing twenty-three Latin inscriptions from Oxfordshire, and in each paper, London, 1829, 4to., by P. Duxford, 1876, by Maittaire, London, 1792, and by Chandler, Oxford, 1703; Oct. Palæografinia, 'Inscriptions Athleticae Graecae et Latinae,' Rotterdam, 1698; W. Fleetwood, 'Inscriptionum Antiquarum Syllogos,' London, 1691, 8vo.; R. Fabretri, 'Inscriptiones Antiquae,' Rome, 1899; A. van Dale, 'Dissertationes Antiquariae et Marmorae Rum Romaniae tum Graeciae illustrissimae Inscriptionum,' Amsterdam, 1702, 8vo.; A. F. Gori, 'Inscriptiones Graecae et Romanae quae extant in Etruriae Urbibus,' Florence, 1727, 3 vols. fol.; L. A. Muratori, 'Novum Theaurus Vaticanum,' Rome, 1736, a work in 4 vols. fol., of which eight fasciculi in fol. appeared; and F. G. Velcker published a smaller collection of metrical inscriptions, 'Sylloge Epigraphum Graecorum ex Marmore et Tarso,' published in 1743.

But in the meantime the Berlin Academy had formed the plan of publishing a complete collection of all the known Greek inscriptions, of which A. Boecke undertook the editorship. The work was called 'Inscriptiones Graecae et Latinae,' and in 1836, 1 vol. 8vo., containing 1862 inscriptions. Vol. I. appeared in 1836, and besides the most ancient inscriptions, it contains those of Attica, Megaris, Peloponnesus, Boeotia, Locris, Phocis, and Thessaly; the second volume, which appeared in 1843, contains the inscriptions of Aegina, Euboea, Illyricum, the islands of the Ionian Sea, of Macedonia, Thrace, Serbati, the islands of the Aegean, Rhodos, Crete, Cyprus, Caria, Lycia, Myasis, and Bithynia. This great work, in two huge folios, is now the most complete collection of Greek inscriptions. They are arranged, as appears from the above enumeration, according to the towns and localities in which they are found; and in each particular where it is feasible, as in those of Athens, Boecke has judiciously classified them into ten sections:—1. Acta senatus et populi, universitatis et collegiorum; 2. Tabulæ Magistratuum; 3. Tituli Militares; 4. Magistraturum Catalogus; 5. Aegonistica et Gymnastic; 6. Honores Imperatorum et aliorum ex dono Augustæ decreta imperatoria; 7. Tituli Honorari; 8. Donorum Tituli et Operum Publicorum; 9. Conspectus romani imperii; 10. Monumenta privata, maxima sepulchralia. It is partly owing to the influence which Boecke's 'Corpus Inscriptionum' exercised upon the scholars of our time, and partly to the fact that the work was for a long time the only one published, the first volume of Boecke's work a prodigious number of inscriptions have been brought to light by travellers, which were before unknown. Some of them have been incorporated in the second volume of the 'Corpus Inscriptionum,' but others were published too late for insertion, and will be published in a subsequent volume. The list of those inscriptions which have been incorporated in the work of Mr. Hamilton contains a large number of inscriptions from Asia Minor; and lastly Letronne, 'Recueil des Inscriptions Grecques et Latincs de l'Egypte,' voL. i., Paris, 1842, 4to.; and the Philological Journal of Germany, France, and England.

Latin Inscriptions.—These are not less numerous than those of Greece, and are found in great numbers at Rome, in Italy, and all the countries subject to Rome. They embraced the same variety of subjects as the inscriptions in Greece, and if only the principal ones had been preserved the early constitution of Rome would be comparatively clear, whereas now our knowledge of the most important events is confined to what we can only answer by conjectures. Some of the Roman writers have, it is true, made use of the most important inscriptions for the early history of Rome, but not by any means so much as is the case with the histories of Greece. The work of Cytinus does not appear to have been so much directed towards this source of information as that of the Greeks, for there is no instance in the labours of Cytinus, which are published by the Romans themselves, although some of them were of the very highest importance in a constitutional as well as legal point of view. At the time of the overthrow of the Western Empire thousands of inscriptions must have perished, especially those engraved on metal, as the material attracted the avarice of the barbarians. But a great number was still preserved in Rome and Italy, which attracted the attention of the learned even in the middle part of the last century, and the present time.

The oldest collection of inscriptions found at Rome, exists in the monastery of Einsiedeln; it is written on parchment, and probably belongs to the tenth or eleventh century. It was printed in Maihilion ('Vetustus Annum,' p. 365, &c.). At the time of the revival of letters, the attention of the learned was chiefly directed towards the authors of antiquity, but ever since the fifteenth century attention has also been bestowed upon inscriptions. The man who first formed the idea of a comprehensive collection was the above-mentioned Cytinus, who undertook his travels at the request and the expense of Pope Nicholas I. The first printed collection of Latin inscriptions is that of Diberti, who published those which were found at Augsburg and in its neighbourhood on seven folio leaves, under the title of 'Romanae Vestimentis Fragmentis' in Augusti Vindeliciorum et ejus Dioecesi,' Augsburg, 1545. Another collection, now extremely rare, was published by Laurentius Abstemius, at Fano in 1516, of which a second edition by P. Polyarchus appeared in the same year. The work published by the book-seller Mascani, at Rome, in 1520, in folio, under the title 'Epigraphum Antiqua Urbis Romae,' contains scarcely any other than sepulchral inscriptions.

After these collections of local inscriptions, B. Amentius and P. Apianius, supported by the liberal merchant Raimund von Fugger, published a general collection under the title of 'Inscriptiones Sacramentorvm Vestatvm,' Ingolstadt, 1584, fol. Soon after, the learned George Fabricius published a considerable collection of Latin inscriptions which he had made in his travels, and which had been communicated to him by his friends, in the second volume of his 'Roma,' Basle, 1590, reprinted in 1597, and at Helmstadir, 1600, fol. Martin Sacentius of Bruges, during a stay of six years in Italy, made a very careful collection of inscriptions, which however were not published till after his death by James Doua, and with an exact commentary by J. Gaffurius, 'Inscriptionum Romanorum veterum,' Paris, 1660, fol. Martin Serenus of Laurentius Schneider, 'Monumenta Italice,' has one volume which contains only inscriptions which he had collected during his visits in Italy; they are arranged according to the towns in which they were found, and the differences found between the earlier and later inscriptions, and he has some which are evidently not genuine. After that of Schrab followed that of Thon Reinicius, which was continued
above. A somewhat more complete and accurate collection of 4688 inscriptions was published by Fabretti under the title 'Inscriptionum Antiquarum, quae in Aedibus Paterni asservantur Expositio et Additamentum,' Rome, 1699, fol. (some copies up to a date of 1702, but this is only a bookseller's imposition).

But all the works here mentioned are eclipsed by the undertaking of Janus Gruterus, which was to contain all the inscriptions that had until then been made known. He took the work of Smedius as his foundation, and was actively assisted by Joseph Scaliger. The collection appeared under the title 'Inscriptiones Antiquitatum Romanorum,' Gruter, 1573, 8 vols. 4to., and Josephus Scaliger afterwards undertook to edit a still more complete and corrected edition, but he did not live to complete his task, which fell into the hands of P. Burmann, who, assisted by many learned scholars, published the new edition of Gruter, under the title 'Inscriptiones Antiquae totius Orbis Romanorum,' in absolutissimam Corpus redactae, aliqui suspecta J. Scaligeri et M. Velsleri, industria autem Jani Gruteri, nune notis Marquardi Godii emendatae, cura J. G. Graevii, Amsterdam, 1707, fol. Marquard Gude, who had travelled in Italy, likewise prepared a collection of inscriptions for publication, which however was edited after his death by F. Hessel, Ludovisi, 1731, fol. This collection however contains many forgeries made by the notorious Ligerius. A collection of 2000 inscriptions which had been gathered by Doni, was published by Gori, 'T. B. Donii Inscriptiones Antiquitatum Romanarum Libri IV,' in folio, 1731. Doni also published his 'Novus Thaurusarum Veterum Inscriptionum,' Milan, 1739, 4 vols. 4to., with a supplement by S. Donatus in 2 vols., Luca, 1755, 8vo. Among the collections of inscriptions that at a later time, with increased importance, with the exception of the selection from all the known inscriptions which was published by J. C. Orelli, under the title 'Inscriptiones Latinarum selectarum ad usum Simplicissimi Colleto ad illustrandas Romaniae Antiquitates ejusdem civitatis accommodatae, &c.; cum ineditis Hagenbuchi suisque Annotationibus,' Zurich, 1828, 2 vols. 8vo. This collection is extremely useful, but it is to be regretted that the editor has not published the inscriptions with the necessary accuracy and exactness which are required in works of this kind.

In modern times the number of Latin inscriptions found in the various parts of the world which once were subject to Rome, has been increased enormously, and will increase every year, as archæological societies are formed in all parts of Europe, with the express object of searching after, preserving, and publishing the Roman monuments existing in the particular districts in which those societies are formed. The number of Latin inscriptions now known amounts to about 60,000, and that of a new and complete collection has long been felt. The Danish scholar Olaus Kellermann, who lived in Italy for some time, formed the plan of publishing a collection of Latin inscriptions similar to the 'Corpus Inscriptionum Latinarum,' Brockh, but in 1837 presented the carrying out of his plan. O. Jahn honoured his memory by the publication of his 'Specimen Epigraphicum in Memorian Olai Kellermann,' Kiel, 1841, 8vo., and it is planned to publish a complete collection of all the known Latin inscriptions has recently been held out. On the 6th of July, 1843, Villemain, the French minister of public instruction, requested the Academy of Inscriptions in Paris to prepare such a collection, and a commission of French savans has been appointed to conduct and superintend the work. Several pamphlets have since appeared both in France and Germany, containing suggestions respecting the principles which should be followed in the arrangements of the inscriptions.

Among the works to be consulted by those who wish to acquire a facility in reading and understanding Latin inscriptions, the following are of particular importance: 'The Ephemerides of the Lapidaria,' Rome, 1770, and Venice, 1792; Morelli, 'De Stilo Inscriptionum Latinarum Libri Tres,' Rome, 1781, and in 1842, 4 vols. 8vo.; Kopp, 'Palaeographia,' London, 1839, 4 vols. 4to.; and Orelli's Introduction to his Collection.

Insecta. FOSSIL. Until within a few years the occurrence of insects in a fossil state could only be substantiated by geologists by the discovery of localities, situated (as at Aix in Provence) among lacustrine tertiary strata, or (as at Stonesfield in Oxfordshire and Solenhofen in Franconia) among marine oilite beds. But Mr. Prestwich has added traces of coleoptera from the coal formation of Coalbrookdale, and Mr. Strickland parts of neopterans from the cliffs of Warwickshire; Mr. Buckland obtains neopterans from the cliffs of Stonesfield, and Mr. Brodie portions of insects belonging to various natural orders from the cliffs of Somersetshire, in the Wiltshire and in the Vale of Wardour in Wiltz, and the Vale of Aylesbury. Still the number of fossil insects, whether we estimate individuals or species, is very small compared to the probable number of animals existing; a circumstance which has explicable by reference to the phenomena which are now taking place in nature; for of upwards of 12,000 British species of insects there is reason to believe that with a very minute proportion of those which exist in the wild state, and are preserved in lacustrine, estuarine, or marine deposits now in progress. Only one elytron of a small beetle was observed in a deposit of the elephantoid era in Yorkshire, and one species of sambelline plant, along with hundreds of shells which inhabited the lake.

No doubt vast numbers of insects, wandering by capric or drifted by winds, pass from the shore and fall in the sea: we learn from the first voyage of Cook, who sailed through myriads of insects, some on the wing and others in the water, even thirty leagues from land off the coast of South America; but few of these escape the watchful finny races, or ever reach the bottom of the sea.

In like manner we find land insects humped in profusion by winds on certain tracts of fresh water, and borne down the course of rivers. This fact is of great importance to those who make use of particular suppositions, such as evaporation or slow draining off of the water, may offer the nearest analogy to the facts actually observed in the greater number of insect deposits.

The collection of neopterans is therefore to be regarded as an exceptional case, and this makes the circumstances brought to light concerning them remarkable and difficult of interpretation. We find however from Mr. Brodie that the shells in a certain bed or mass of thin beds in the lakes; similarly they occur particular lakes in the colite, the Wealden deposits, and in the tertiary accumulations of Aix, Oeningen, and Auvergne. In the latter region the ancient inhabitants of Aix, Oeningen, the use of animal deposits in the formation of peculiar limestones ('Insidial Limestone'). In the following summary of the groups of fossil insects in Britain, the most recent stratifications come first. The catalogue commences with the elephantoid era. The authorities and localities are given for each case. (See Morris's Catalogue of Fossils; Brodie's Fossil Insects; Lyell, 'Geol. Pr.'; Phillips, 'Geol. Yorkshire'; Strickland, in 'May. of Nat. Hist.'; Buckland, 'Bridgewater Treatise' and 'Geol. Proceed."

1. Pteroptera fresh-water deposits ('Pleistocene').

Elytron of a Chrysomya. Bliedews, in Yorkshire. (Phillips.)

2. Remains of Copris lunaris. Mundenes, Norfolk. (Lyell.)

3. Donacia. H. Levis, in Yorkshire. (Lyell.)

4. Coleoptera. Southwood, Suffolk. (Alexander.)

5. No true aquatic beetle is mentioned among these. Donacia haunts aquatic plants. The others are strictly terrestrial. They may have been drifted into the lakes in which the Planorbis, &c., lived.

2. In the Cretaceous System, no insects yet found.

3. In the Wealden strata of the Vale of Wardour (found by Mr. Brodie and examined by Mr. Westwood).—

1. Land Coleoptera, of the families—Carabidae; Harpalidae; Staphylinidae; Buprestidae; Tenebrionidae; Elateridae; Curculionidae; Cantharidae; Helyphoridae. Aquatic Coleoptera of the families—Hydropilidae; Dytiscidae; (Colymbetidae)

Orthoptera, of the genera Achatia and Blatta.

Hemiptera and Homoptera, including land tribes, as Cimicidae, Coreidae, Heteroptera, &c.; aquatic species of Vella and Hydrometra.

Neopterans. In this water-haunting order occur Libellula and Eulisma, Cordylidae, Libellulidae, Termeutes and Leptoceridae.

Trichoptera. (Councilia, Tiphulina, &c.)

Diptera. Simulium; Platyrrhina; Tanytarsus; Chironomus; Culex; Tipulidae, &c. (Aquatic larva) Empidinae.

4. In the oölite strata, insects occur in a state of preservation probably little inferior in number of Stonesfield and several other localities in Gloucestershire and near Bath. Mr. Buckland has described several species in the Geological Proceedings and in his Bridgewater Treatise on Geology, and Mr. Brodie has added others. The remains are chiefly Elytra of Coleoptera.
and wings of Neuroptera. The following is abstracted from Mr. Brodie's list.

Coleoptera, of the families Prionidæ, Buprestidæ, Pimelicidæ? Chrysomelidæ? Coccinellidæ?

Buckland.

5. In the Upper Lisa at Dumbarton and Churchdown. (Brodie.)

In the Lower Lisa—are the bone-bed of Aust Cliff, Wainside Cliff, &c. on the Severs; Coombe Hill, Cruachan, Hasfield, Croomwood Hill, &c. in Gloucestershire. (Brodie.)

(Mr. Westwood has examined 300 specimens of insects from the Lisa beds.)

Colespeter's, of the families Buprestidæ? Elateridæ; Curculionidæ or Chrysomelidæ; Carabidæ; Telephoridæ; Melolonthidæ, &c.; a species of Gyrinus.

Orthoptera, including Gryllidæ and Blattidæ.

Hemiptera and Homoptera. Cicadæ? Cimicidæ?

Neuroptera. These are the best determined of the fossil groups, owing to the structures of the wings being clear and characteristic.

Libellula, Brodeiæ (Br.): in Dumbarton, Gloucester. (Brodie.)

Agrion, Buckmanni (Br.), in Dumbarton. (Brodie.)

Aeshna, lissina (Strickland).

Orthoptera, under Stenopina (Westwood).

Hemerothorax Higginsi (Br.).

Chauliodes.

Ephemeræ.

Diptera.

Araia? ignota (Brodie). (Brodie.)

Ephemera.

In the larger beds that the insects are most abundant. They occur in this part (between the ordinary lisa limestone and the bone bed) so extensively as to justify the application of the term "insect limestone," used by Mr. Brodie. As a whole the insect appears to contain larger proportions of aquatic tribes than the Wealden. There is no decided evidence amongst them of the prevalence of a warm climate at the time and in the place of their existence. They are usually of small size, not so entire as to forbid the supposition of having been drifted (the Neuroptera may have been less drifted than the Coleoptera; and if there were islands or high coasts adjacent, these might nourish, and in time of floods send down the small coleopterous insects to be imbedded with the fucoid, oysters, and mollusca of the coasts, and forms of life of the land and streams.)

6. In the ironstone nodules lying in the carboniferous deposits of Coalbrook Dale, Mr. Prestwick has discovered Coleoptera, Curculiidiæ Anactici (Buckl.), C. Prestvici (Buckl.); and Mr. Murchison, Sil. Syst., p. 105, mentions an insect to which the name of Corydalis Brongniartii is assigned. It is very possible that the laminated limestone deposits of Burdie House near Edinburgh and Ashford in Derbyshire may yield insect remains older than any yet met with, and seeing the frequent connexion or proximity of fossil insects to fossil fishes, it may be worth while to search the lower beds of the mountain limestone where the rich fish-beds occur in it, on the Avon, in Clyde Island, and in Forthmagan. The fish-beds of the magnesian limestone (mari slate) may also be indicated for further research. A very interesting addition to the fossil insects of Aix has been made known by M. Coquand. It is a beetle, and has been discovered by Brechelau, who has been able to recognize perfectly its generic and specific characters. It belongs to one of those genera the species of which are not numerous, and are at present confined to the islands of the Indian Archipelago, or the warmest countries of the Asiatic continent. It belongs to the genus Cylo—i.e. an extinct species—and is named C. sepulta. M. Boisdault has examined the other fossil insects of Aix, and differing both from Curtis and from the dissect of Natica, has added them to the extra-European genera, and extinct species.

INSECTS. GEOGRAPHICAL DISTRIBUTION OF.

The various kinds of insects, even when furnished, as the greater number of them are, with powerful organs for flight, are each and all distributed within certain bounds in the most stationary animals or plants. Independence, then, of its great interest as a part of philosophical zoology, the only of the range and specific centres of the forms of insect life becomes of great importance as an aid in the definition of tribes, genera, and species. As yet, however, entomologists have made comparatively little progress in this direction, and have rather occupied themselves in recording the distribution of specimens in cabinets than of species on the earth's surface.

Climate and the extension or form of land are the chief influences regulating the distribution of insect life. The constitution of the soil affects it also, but in a secondary manner, through its influence on the vegetation, on which many insects feed. The influence of the intersection of tracts of waters of mountain barriers, or other causes depending on antient geological events anterior to the origin of the existing fauna of the earth, tracts of land presenting exactly similar conditions of climate and soil are placed far apart, we then have, not a repetition of the same forms among their insect population, but a representation by similar forms. This we see also in the several of the zones of climate, belting mountains at different heights. Man's agency, and the transporting power of currents of wind modify the distribution of many species of insects. In the following brief glance at the distribution of the principal genera of insects, examples of all these influences will be found.

Coleoptera.—From the facility with which insects of this division may be preserved and transported from place to place, the geographical distribution of the species, more than any of the species of other orders. The Coccinellides are dispersed over most parts of the globe, the typical genus being cosmopolitan, whilst other groups are more limited. Among the Curculiidiæ are genera peculiar to Europe, Chlamisæ, Agonus, and Anuros, are common to both hemispheres. Harpalus and Bruchusæ are cosmopolitan. Cerambycæ occur in Africa and Chili. The Carabidæ of Western Asia agree remarkably with those of Europe. Erichson has remarked that Carabi are very constant to certain soils: the vertical distribution of the species is also very constant. The water-beetles allied to Dytiscus, itself universal in the old world; several of the species live in salt or brackish waters. Gyrinus ranges from Northern Europe to New Holland. The Brachyelytra have their chief centre in Europe. The typical genus Staphylinus appears however to be represented everywhere: many species occur in South America. A species of Aleochara is found in Van Diemen's Land. Elater and Destrugas, types of families, are both cosmopolitan; the species are often present in the northern hemisphere, and their distribution depends, in many cases, on that of certain plants on which the larvae prey. Among the fire-flies (Lampyridæ) the genus Lampyris, which is European, is represented in Asia by L. Caeliferus, in Australia, returning to the tropics by L. Bivittatus, and in the New World, by L. Auratus. The Malachi are found everywhere, except in South America. Plinus, a genus chiefly European, has a single representative in Australia. Of the Necrobiidiæ, the genera Cryptophagus, Cryptophasa, and Stenomyia, range from Britain to China, and from Brazil to Lapland. Hister, the type of a family, is also a cosmopolitan genus. Byrrhus belongs to the northern hemisphere, and has its chief centre in Europe. Among the pinnipedia, the genus Aphodius, though represented in most countries, is chiefly developed in temperate regions; whilst Ateuchus, on the other hand, is mainly tropical. Geotrupes is cosmopolitan. Copris ranges to New Zealand, where however it is confined to the north coast. Scarabæus is subtropical. Pelidnota is American. The beautiful Cetonia appear to be of universal distribution. The strange forms of Geolithus are of Northern America. In the south, the cockchafer family, with the species of the South American species in the south, Macroacta and Anoplognatha, confined to Australia; Hoplia, with one exception, European; Ambrosius is Mediterranean; Anisoplia and Serica natives of the tropic regions of the Old World. Of the Sienylida, Helys, is cosmopolitan, Celedinae European. Of the Anthicidae the numerous species of Anthicus are chiefly inhabitants of temperate regions. Geotrupidæ are very generally distributed.

Of the ten thousand species of weevils the great genera Curtephoræ, Cryptorhynchæ, Cylindrus, Othorhynchæ, and Oicles are all cosmopolitan. Platypnsa and Cylobus are South American; Brachyphora, South African and Mediterran- 

Digitized by Google
The distribution of the species of weevils depends in a great measure on that of the hosts. The most beautiful and vividly coloured forms of Longicorn beetles are mostly tropical. The presence of forests determines that of many of the genera. Of the seventy genera of Cerambicidae, forty-one are cosmopolitan. Others have defined centres, as *Clytus* in Europe, *Trachydera* in South America.

Of the Chrysomelidae, the typical genus Chrysomela is cosmopolitan. The presence of certain plants determines the distribution of the species. From this cause, species of limited distribution are sometimes multiplied far from their aboriginal habitats. The *Chrysolinae*, introduced from Europe into America, multiplied so at Baltimore in the years 1838 and 1839, that the elm trees of the district were eaten bare by their larves, and probably will they henceforth become a constant annoyance in the New World. *Leucaena* and *Donacia* are instances of cosmopolitan genera having distinct centres in temperate climates. *Casida*, on the other hand, has its centre in the tropics.

Of the *Trimeria*, *Coccinellidae* are found everywhere. *Eumorphus* is Indian and Polynesian.

Orthoptera.—Though by no means an extensive order either as to genus or species, the Orthoptera are of very great importance in the economic history of the regions. *Gryllus* and *Acrida*, the grasshoppers and crickets, are found in most countries. The *Locusta* are mostly exotic. The strange *Phasmus* are mostly tropical, as are also the greater number of the Orthoptera in the islands of the South Seas. *Dysbina* is more widely distributed. *Ommatius*, a genus of *Ascidia*, has its members in all parts of the world. A great many genera are peculiar to South America, and several to Africa, hot, woolly, and moist regions being particularly well supplied with species. *Blatta*, *Blattina*, and *Blattula*, are very general, and have been greatly diffused from their original centres by unintentional human agency. The earwig tribes, *Forficulae*, including more than fifty species, are, in great part, European, but range even to Van Diemen’s Land.

Ericson notices the curious fact respecting the Orthoptera of Van Diemen’s Land, that only one fourth of the species are capable of being winged and capable of flying.

Neuroptera.—The number of known species in this order is short of one thousand. The section of *Phlephenanes* is almost entirely European; the genus *Macronomus*, including species from Madagascar and Brazil, is an exception. The *Plaenophanes*, a great part of the genera of which division are now considered by many naturalists *Orthoptera*, have a much more varied distribution. Thus the *Myrmeloneuridae* are cosmopolitan, the *Perla* and *Nemoura* chiefly European, the *Pentatoma* characteristic of the temperate regions of both the old and new world, the *Termes* of the tropics. In the section of *Subhelicornia*, the *Ephemerae* are European; the *Ascalaphidae*, cosmopolitan; as also the true dragon-flies, *Libellulae*, of which near two hundred species are known. Other allied genera are more limited.

In looking among the sting-bearing species, the true bees are characteristic of the ancient continent, those now dispersed in America having been transported from Europe. The genera *Centris* and *Eucoilus* are exclusively American. *Nomia* is Asiatic. *Alloxylo* is south African. *Androctonus* and *Xylocopa*, and several other extensive genera, are cosmopolitan. A great many genera of wasps are peculiar to South America. The ants are most developed in Europe. *Bembix* is a tropical genus. The teretebrating *Hymenoptera* are both very numerous and widely distributed, especially the great genus *Ichneumon*. Certain genera forming the family *Oxytera* are exclusively European, as are also a great part of the numerous family of *Chalcidinae*. *Cynips* is European, and the greater number of *Tenthredinidae*.

The distribution of the Strepsiptera depends on that of the insects on which they are parasitic.

The distribution of the butterflies shall have been worked out, it will doubtless prove very interesting. At present our knowledge of this subject is imperfect. The *Papilionidae* are very numerous specifically, and far outstrip the *Coccinellidae*. Some of them possess great ranges. Thus certain species of *Pierca* are found over all Europe, and great part of Asia and Africa. Other forms are restricted to mountainous regions. Of the *Nymphalidae* the great number of species are tropical, and in this family there are some remarkable instances of extensive distribution of species. Thus *Vanessa Cardui* (a common British butterfly) is found in every part of the world, and *Vanessa Atalanta* ranges over Europe, Asia and Africa, and to North America. In the remaining tribes the typical genera are almost always cosmopolitan, whilst others have more limited areas.

The *Selysiana* and *Zyginae* are in great part European; the *Cardinalinae* mostly tropical.

Among the moths, the *Phalinae* are chiefly European, and the species are usually widely distributed. This appears to be the same with the other families of Nocturnal Lepidoptera, probably rather in consequence of one, or the other, of the known knowledge of exotic forms, than because it is really so, for we find types and species in distant regions wherever they have been introduced. *Cossinae*, introduced from Asiatic Russia, where the researches of Eversmann among these insects have brought many new forms to light.

Diptera.—One-half of the described species of two-winged flies (above those of the Coleoptera) are introduced from Europe. This disparity proportion arises from our comparative ignorance of the exotic forms. The small group of *Omnithomyzae*, parasites on quadrupeds and birds, has representatives of all its genera in Europe, the few remaining species being natives of eastern Asia, Western Africa, Australia, or Brazil. The flies forming the family of *Musciae* include a great number of genera, both European and exotic, the former being most prolific in species, some of which have wide ranges. *The Sphingidae* are in the same category. The genus *Chrysopea*, equally developed in Europe and America, and represented in a less degree in Africa and Asia, does not appear in Australia nor in the islands of the South Seas. *Dysbina* is more widely distributed. *Ommatius*, a genus of *Ascidia*, has its members in all parts of the world. A great many genera are peculiar to South America, and several to Africa, hot, woolly, and moist regions being particularly well supplied with species. The number of the numerous and varied forms in most parts of the world, is excluded from Australia and the Pacific, which region seems to be the least prolific in *Diptera*. *Culex* is very generally distributed.

Hemiptera.—Of the two great divisions of this order, the *Hemipterae* and the *Heteroptera*, the first is the smallest and also the most tropical. The distribution of the insects comprising these depends mainly on the fauna and vegetation of the countries they inhabit. Thus each species of *Coccus* aphids is with a range correspondent to that of the plant upon which it feeds; and of the *Corvidae* and *Leptopidea* with the presence of their favourite animal food. Among the most interesting of the families of *Hemipterae* are the *Cicadeae*, of which the genus *Tettigonia* includes 200 species, centred in America, but having members also in the Old World; the *Pulicidae*, or Dancing-flies, very generally distributed throughout warm climates; *Scutelleridae*, remarkable for brilliancy, and mostly equatorial; and *Cimex*, of which the only true species is the common bed-bug, a pest spread over all Europe. Of the Aquatic *Hemipterae* *Gerris* and *Nepa* are cosmopolitan; *Pelecusa* and the *Nectonectidae*, mostly European; *Galbulus* and *Monomyzae*, American; and *Holobates*, equatorial.

Thysanura.—The species of the order of this curious group of insects has been scarcely attended to. The species of *Lepisma* range from Europe to China. *Padura* and *Smyrthaea* are European; a single species of the last-named genus occurs in North America.

Anoplura.—These disagreeable parasites have lately been honoured by the attention of some excellent naturalists, especially Denny and Gwilt. Their distribution corresponds with that of the animals upon which they are found. The equally annoying order *Apothameptera* three-fourths of the known species are European. The common flea is a cosmopolitan, and the Chigo is confined to South America.

IN SOLVENCY. From August, 1843, to August, 1845, three acts have been passed relating to insolvent debtors; these are 5 & 6 Vic. c. 116; 7 & 8 Vic. c. 96; and 8 & 9 Vic. c. 127.

The acts of & 6 Vic. c. 116, which came into operation 1st November, 1842, enabled a person who was not a trader within the meaning of the bankrupt laws, or a trader who owed debts which amounted in the whole to less than 300L., to obtain for petitions protection from creditors. The commissioners of the Court of Bankruptcy in London or the Commissioners of the District Courts of Bankruptcy in the counties, from all process whatever (except under the judge’s order), either against his person or property until the hearing of the case. The principle was, that the insolvency’s property was vested in an official assignee appointed by the court. If, on the hearing of the petition, the commissioners were satisfied with the allegations which it contained, and that the debts were uncollectible, breach of trust, or by any proceedings for breach of the laws,
he was empowered to make a final order for the protection of the petitioner from all process, and to cause his estate and effects to be sold and disposed of to any assignee chosen by the creditors.

The act 7 & 8 Vict. c. 96, passed 9th August 1844, is entitled 'An act to amend the law of Insolvency, Bankruptcy, and Civil Procedure in Bankruptcy.' It may be remarked as an act upon judgment in an action for debt, who was not a trader, or whose debts, if a trader, were under 200l., may, without any process or issue, by petition to a bankruptcy court, be protected from arrest and from being detained in prison for any debt mentioned in his schedule; and if so detained, the commissioners of any bankruptcy court may order his discharge.

The property of the insolvent may be seized for the benefit of his creditors with the exception of the wearing apparel, bedding, and other necessaries of the petitioner (the insolvent under 7 & 8 Vict. c. 96) and his family, and the working tools and implements of the petitioner not exceeding in the whole the value of 20l. Under the 7 & 8 Vict. c. 96 (§ 39) if a petitioner for protection from process (pursuant to the provisions of that act) shall wrongfully and fraudulently omit in the schedule, which schedule he is required to make (§ 6 & 7 Vict. c. 116), any property whatever, or retain or exempt out of such schedule any wearing apparel, bedding, or other necessaries, in priority of any debt over 20l., he shall, in default of conviction, be liable to be imprisoned and kept to hard labour for any period not exceeding three years.

The 7 & 8 Vict. c. 96, made a great alteration as to debts under 20l., and also relieved many small debtors who were in debt and not in circumstances to pay; for it is expedient to limit the present power of arrest upon final process, be it enacted, that from and after the passing of this act, no person shall be taken or charged in execution upon any judgment obtained in any court of ducy's superior court, or in any county court, court of requests, or other inferior court, in any action for the recovery of any debt wherein the sum recovered shall not exceed the sum of 20l. exclusive of the costs recovered by such judgment. The 56th section provided that upon application to a judge of one of the superior courts of law at Westminster, or to the court in which such judgment was obtained, any judgment shall not be taken in execution against the property of the debtor, just as they might have had if he had never been taken in execution upon such judgment. The 56th section gave to the judge who should try such cause (§ 58), the power either of discharge or of imprisonment for the time to the court of the barister or attorney at law, power to imprison the defendant (debtor) for such times as are mentioned in § 58, if he should appear to have been guilty of fraud in contracting the debt, or had contrived it under the other circumstances mentioned in the 56th section.

The amount of debts in England and Wales under 20l., must always form a very considerable proportion of all the debts that are at any time due in the United Kingdom. Such debts comprehend a large part of the dealings of shopkeepers and petty traders; probably in a very large number of cases debts under 20l., for every one comprehends every debt that is due to a large body of petty traders. Those debts should do in many cases give credit to persons who have no means of payment, and with whose character and condition they are very imperfectly acquainted. Many persons always being willing to extend a debt, but never being able to pay if they can help it. Another class of debtors consists of those whose morality is not so well fixed as to make them good and willing to pay, which takes the jurisdicition of the courts of equity. To all of these classes of debtors, some influence of some feeling of honesty and some fear of the consequences of non-payment. A third class, which we hope may be the most numerous of all, is willing to pay, but often is deprived of the means of payment if they cannot command the credit which their character and earnings fairly entitle them to. [Creditor, P. C. S.]

The 57th and 58th sections of the 7 & 8 Vict. c. 96, deprived creditors of their hold upon their debtors for sums under 20l., and left to all persons who had claims upon persons under 20l., the right of prosecuting their debtors there. As to debts under 20l. existing before the act, and for which the debtor was not in execution, it left the creditor no remedy except against his property. And here let it be remarked that the amount of debts under 20l. is so small that the insolvency of creditors seems reducible within narrow limits, if we view it merely as it affects the interests of the community. The object in allowing a debtor to be set free from the punishment of being held as a debtor, but that he may be subjected to a considerable punishment for the purpose of discovering what his property is, that he has not parted with it to defraud his creditors, and that there was no fraud in the contracting the debt. For the simple fact of being indebted and unable to pay should not be punished. The contracting debtors under such circumstances as amount to fraud ought to be punished. The principle then which should guide a creditor should be, not to punish a man simply because he is indebted and cannot pay his debts, but to punish him for any fraud that is committed either in contracting the debt or in attempting to evade the payment of it. Now in the case of a debtor, fraud, both in contracting a debt and in attempting to evade payment, is known by experience to be a thing of frequent occurrence; and it is therefore just and reasonable that judgment creditors should have the power to secure the person of their debtor until he be held to have made a full and honest statement of his means of payment.

The effect of the last-mentioned act was of course to diminish the credit given by small dealers to all persons. The act 7 & 8 Vict. c. 96, relating to small debts, had also relieved many small debtors who were in debt and not in circumstances to pay, for it is expedient to limit the present power of arrest upon final process, be it enacted, That from and after the passing of this act, no person shall be taken or charged in execution upon any judgment obtained in any court of ducy's superior court, or in any county court, court of requests, or other inferior court, in any action for the recovery of any debt wherein the sum recovered shall not exceed the sum of 20l. exclusive of the costs recovered by such judgment.

The 56th section provided that upon application to a judge of one of the superior courts of law at Westminster, or to the court in which such judgment was obtained, any judgment shall not be taken in execution against the property of the debtor, just as they might have had if he had never been taken in execution upon such judgment. The 56th section gave to the judge who should try such cause (§ 58), the power either of discharge or of imprisonment for the time to the court of the barister or attorney at law, power to imprison the defendant (debtor) for such times as are mentioned in § 58, if he should appear to have been guilty of fraud in contracting the debt, or had contrived it under the other circumstances mentioned in the 56th section.

The amount of debts in England and Wales under 20l., must always form a very considerable proportion of all the debts that are at any time due in the United Kingdom. Such debts comprehend a large part of the dealings of shopkeepers and petty traders; probably in a very large number of cases debts under 20l., for every one comprehends every debt that is due to a large body of petty traders. Those debts should do in many cases give credit to persons who have no means of payment, and with whose character and condition they are very imperfectly acquainted. Many persons always being willing to extend a debt, but never being able to pay if they can help it. Another class of debtors consists of those whose morality is not so well fixed as to make them good and willing to pay, which takes the jurisdicition of the courts of equity. To all of these classes of debtors, some influence of some feeling of honesty and some fear of the consequences of non-payment. A third class, which we hope may be the most numerous of all, is willing to pay, but often is deprived of the means of payment if they cannot command the credit which their character and earnings fairly entitle them to. [Creditor, P. C. S.]
or by the creditor if he think fit, 'touching the manner and time of his contracting the debt, the means or prospect of payment he then had, the property or means of payment he still hath or may have, the disposal he may have made of any property since contracting the debt.' The commissioner is empowered to make an order on the debtor 'for the payment of his debt by instalment or otherwise; and if the debtor fails to attend or to make satisfactory answer, or shall appear to have committed any fraud in the commission of the debt, or if he have wilfully contracted it without reasonable prospect of being able to pay it, or to have concealed or made away with his property in order to defeat his creditors, the commissioner or any of them may make an order for the payment of the debt, or for the seizure of the whole or a sum not exceeding $20 in value, are exempted from seizure. The powers of all inferior courts under this act are assimilated; and a suit commenced in one small debt court cannot be removed to another, like suits in the same town. When a debt exceeds $20, the suit may be removed by certainiri to the superior courts. Any of her Majesty's secretaries of state are empowered to alter or enlarge the jurisdiction of all small debts and inferior courts. The act itself enlarges the jurisdiction of courts of requests, where sums not exceeding $20 could heretofore only be recovered, and now sums not exceeding $20 may be recovered in courts of request, as well as courts of record. All suits most be paid into court and not claimed for six years is to go into a fund for the payment of the necessary expenses of carrying on the business of the court.

3. 'The Securities, sect. 70, which came into operation 1st September, 1844, and is entitled 'An Act for facilitating Arrangements between Debtors and Creditors,' is of the nature of an insolvent act. Under this act a debtor who is not subject to the bankruptcy laws may apply by petition to a court of bankruptcy and obtain protection from arrest, provided his petition be signed by one-third in number and value of his creditors. The debtor's petition must set forth the cause of insolvency of those creditors, and a description of the property for the future payment or the compromise of his debts, and a statement of his assets and debts. Any one of the commissioners of bankruptcy may examine the petitioning debtor, or any creditor who may join in the petition, or any witness produced by the debtor, in private; and if he be satisfied with the statements made, he may convene a general meeting of all the petitioners' creditors, and appoint an official assignee, registrar, or a creditor to report the proceedings. If at the first meeting the major part of the creditors in number and value, or nine-tenths in value, or nine-tenths in number of those whose debts exceed $20, shall assent to the proposition of the debtor, the compromise is to be approved by three-fifths of the creditors present in number and value, or nine-tenths in value, or nine-tenths in number of those whose debts exceed $20, to agree to the arrangement made. If the arrangement made fails of being effectual and reducing the debts to less than $20, the creditors shall be divided among, the several creditors, provided such resolution shall be binding, provided one full third of the creditors in number and value be present. Under this arrangement the affairs of the debtor may be settled. When this has been effected, a meeting of the creditors is to be held before the commissioner, who is to give the debtor a certificate, which shall operate as a certificate under the statute relating to bankrupts.

The regulations of the 7 & 8 Vict. c. 96, as to debts under $20, caused universal dissatisfaction among creditors in England and Wales, as we have already observed. The evidence taken by the Committee of 1841 proved the necessity of amending this act. The history of this subject shows the unwise legislation and of its correction is useful. It shows how ill-considered measures may sometimes become law in the heat of the moment. Whether the mass of public business is so enormous that important statutes are sometimes enacted without due deliberation. It also shows that the force of opinion, when sustained by sound reasons and directed by men of judgment, is not strong enough to induce the legislature to amend their mistakes.

The law of debtor and creditor has been a difficulty in all countries. In England an insolvent debtor may, in certain cases, be protected from the operation of the law. If he cannot claim the benefit of the bankruptcy laws, he is subject to the law that relates to insolvent debtors. The question of arrest and imprisonment for debt has been chiefly discussed with reference to insolvent debtors, that is, the class of debtors whose debts have not been contracted in the operations of trade or commerce, or under such circumstances as to bring them within the bankruptcy laws.

Formerly there were two kinds of arrest in civil cases, that which took place before trial, and was called arrest on mesne process; and that which takes place after trial and judgment, and is called arrest on final process. In the arrest on mesne process it was only necessary for the plaintiff to make an affidavit that the defendant had made away with his property, or that he had committed any fraud in the commission of the debt, which was to be proved by the sheriff, who thereupon gave his officers a warrant for seizing the debts of the creditor. The statute 5 & 6 Vict. c. 110, § 85 enacted that no one person can be arrested for alleged debt before a judgment has been obtained against him, unless it can be shown to the satisfaction of a judge of one of the superior courts that the plaintiff has a cause of action against such person to the amount of $20 or upwards, and that there is probable cause to believe that the defendant is about to quit England. A defendant also be arrested upon mesne process when he has received an unfavourable judgment in the court for the relief of insolvent debtors (1 & 2 Vict. c. 110, § 85).

Arrest in execution is therefore now the only arrest that is of any practical importance: it means the arresting of a man after a court of justice has decided that he owes a debt. The ground of arresting the man is, that he does not pay the debt pursuant to the judgment; in other words, he disobeys the order of the court. "Every defendant is bound that he must pay a certain sum of money to the plaintiff." On the subject of maintaining the law of arrest in execution there has been difference of opinion. The best arguments in favour of arrest in execution have been advanced by the Supplementary Paper on Bankruptcy and Insolvency, by William John Law, Esq., Dissenting from the Report. Presented to both Houses of Parliament, 1841. Mr. Law did not sign the report of the other commissioners on the subject because he did not agree with them; and the Supplementary Paper contains the reasons of his dissent.

With respect to arrest in execution, Mr. Law's intimate acquaintance with knowledge on the subject has enabled him to answer fully all the arguments of those who attempt to show the insufficiency of this final arrest. He has proved beyond doubt the justice of this final arrest, or if the word justice be objected to, its usefulness to the community. A man is not now arrested till he has disobeyed the judgment of a court of justice. It is his business to show why he disobeyed the judgment; and in the mean time either his person must be secured, or the judgment of the court created as a mere idle form. It may be said, the plaintiff can proceed to take the debtor's property; but even visible property cannot always be got at; when the sheriff goes to seize it, "some of the creditors generally precede him to the market, the bills of sale, and frighten him out again; there is not one plaintiff in five hundred, great or small, who has courage enough to indemnify the officer, and defy the fraud. If there is no visible property, the debtor's right to whatever is his; what must be the difficulty of getting at the property of the debtor which is not visible? And what other mode can be suggested of compelling the defendant to give a true account of all his property than to imprison him until he does? 'A defendant has always been prone to place his property out of reach of an execution, but there has been this one restraint: he says to himself, "If I make my property safe, they will take me, and then I must bring it forward." When property only can be touched, the argument is changed; it becomes this: "If I make my property safe, my enemy can do nothing." So necessary is process against the person of the party against the property, and unanswerable is it to require of the creditor by record the establishment of any further case, in order to entitle him to an execution. The judgment is a question more of the creditor's right, and the property of the other party to establish his exemption from the task of satisfying it." The great argument of the Report from which Mr. Law dissenting has been that all executions suppose fraud. This argument is very absurd. The presumption ought to be against the debtor who does not obey the judgment of the court. He may be guilty of fraud or no. He may not have the means to pay the debt, or may have committed the bankruptcy fraud, or there may be no evidence in the order of the court. This argument against execution is founded on the presumption being in the debtor's favour, instead of being, as it is, against him. 'The practical justice and wisdom is in subjecting all (debtors) to searching inquiry,
for the purpose of ascertaining whether they are dishonest or not. I am quite sure that in that court (the Insolvency Court) it is always found necessary to be applied to every case as the means of disclosing its true character and merits.\(^1\)

1 Blamelessness must not be presumed: faultiness is to be presumed and not to be negated by the word fraud; the precise shade cannot be presumed; the character and degree are to be learned through a deliberate and forced inquiry. It is misrepresentation to say that fraud is presumed and that the power of the coercion which was once purely punishment is now necessary coercion to the investigation of a question in which presumption is and ought to be against the party coerced. The debtor in execution is the applicant for discharge and for his own case, but he is at liberty to institute proceedings towards this question instantly on his arrest; and not only is he at liberty to seek exemption from the consequences of the injury which he has done to the particular party who has pursued him, but he is allowed by law to use the same opportunity for acquiring a privilege against every person in the kingdom towards whom he stands in a similar predicament; on giving to the true owner a part of their property and obtaining by that means the consent of the person to surrender, he receives, if excuse is found for granting it, this great boon—a total freedom for the future of person and property; save that if ever he become in the full and fair sense of the words of ability to pay, there will reside in a competent tribunal the power to ascertain that ability and to exact that payment.

It is almost unnecessary to say that these results ought not to be enjoyed without that full disclosure of the history of his property which is found in the schedule of an insolvent debtor: that full opportunity for the creditors to challenge this history; and that fair, deliberate, and effective investigation of its truth which is made in that court.

These general arguments in favour of the justice of final execution are supported by Mr. Law with facts equally strong, which also prove the efficacy of such arrest. The mode in which he has examined the arguments in favour of abolishing arrest, which are derived from certain returns, is completely convincing. The efficacy of arrest must not be estimated by the extent of dividends made in the insolvent debtors' Court, or the proportion of unfavourable judgments;\(^2\) though it must be remembered that the dividends are not at all, as some people suppose. It is clearly shown by Mr. Law that arrest does make people pay, who do not pay till they are arrested; it is found that the examination to which insolvents are subjected expels the great amount of fraud; and it is also certain that the number of those who are induced to pay by the fear of arrest is considerable, just as the fear of other punishments prevents many persons from committing crimes, who have no other motive to desist from them. The fear of arrest is precisely that preponderating weight which is wanted to induce those whose honesty is wavering to incline to the right side.

The arguments of Mr. Law should be read by every man who wishes to form a sound judgment on the mode of insolvent debtors in England; and so much of his arguments as have been here given, may help to diffuse some just opinions on a subject in which a sympathy with debtors, to the total forfetment of creditors, has led many well-meaning people to adopt conclusions that tend to unsettle all the relations of society, and to confound honest men and rogues. Some valuable observations on the laws relating to imprisonment for debt by Mr. Commissioner Fane are printed in 'The Banker's Magazine,' No. xix., October 1845. He concludes 1st, That the remedy given to creditors by the seizure of goods under a fieris factis (Fieri Facias, P. C.) is a delusive remedy; and 2nd, That such remedy, instead of being beneficial to the creditor, whom it is intended and supposed to assist, actually prejudices him, by enabling the debtor more effectually to cheat him under the law of form; and, therefore, so far as relates to this branch of the subject, the power which each creditor now possesses of seizing his debtor’s goods under a fieris facias for his own exclusive benefit, is a mischievous power which ought to be abolished.

INSURANCE. MARINE. [MARINE INSURANCE, P.C.]

INTEGRATION. In the article INTEGRAL CALCULUS, P. C., the meaning of an integral was explained. The present article is the operation of integration, that is, of finding the primitive function which has a given function for its differential coefficient. Having given P a function of x required Q so that dQ/dx may be P. In the article QUADRATURES, METHOD OF, P. C., is given the mode to which we must have recourse, in order to find particular values of Q, when the general methods for determining it fail. In this article we confine ourselves to what is most useful in operation, as a summary for the advanced student, not an explanation for the learner. Properly speaking, the problem requires some addition to make it definite. Thus 2x has x for a primitive function, and also x²+4 C being any constant quantity whatever. In the present article, we shall neglect this constant altogether, reminding the reader that he must never omit it in any application. If he should refer to different books different functions given as the primitives of one and the same function, he will always find that those different primitives differ only by a constant quantity. Thus \((1-x)⁻¹\) and \(x(1-x)⁻²\) both occur as the primitive of \((1-x)⁻²\); but they only differ by a constant, namely 1.

In the common process of integration, the actual passage from the differential coefficient to the primitive is always an act of memory. The algebraical work which occurs is always used either to reduce a form in which memory will not serve into one in which it will, or else to reduce the given differential coefficient to two terms, one of which can be integrated by memory, and the other of which is more simple than the original quantity.

The functions in which the simple remembrance of the forms of the differential calculus is of use are as follows:

\[
\int dx = x, \int dx dx = \frac{x^{n+1}}{n+1}, \int \frac{dx}{\sqrt{x}} = 2x, \int \frac{dx}{x^2} = \log x, \int \frac{dx}{x^a} = \frac{x^{a-1}}{a-1}, \int x^n dx = \frac{x^{n+1}}{n+1}, \int \frac{x^n}{x^a} dx = \frac{x^{n-a}}{n-a}, \int \frac{dx}{\sqrt{1-x^2}} = \sin^{-1} x, \int \frac{dx}{\sqrt{1-x^2}} = \cos^{-1} x, \int \frac{dx}{1+x^2} = \tan^{-1} x.
\]

To these should be added the following, which may be obtained in various ways from the methods of this article, or from peculiar articles which are found in works on the subject.

\[
\int \frac{dx}{\sqrt{x^2-a^2}} = \sin^{-1} x, \int \frac{dx}{\sqrt{a^2-x^2}} = \log \left( x \pm \sqrt{a^2-x^2} \right), \int \frac{dx}{\sqrt{x^2+1}} = \log (x + \sqrt{x^2+1}), \int \frac{dx}{\sqrt{x^2-a^2}} = \log \left( x \pm \sqrt{x^2-a^2} \right), \int \frac{dx}{\sqrt{x^2+1}} = \log \left( x + \sqrt{x^2+1} \right), \int \frac{dx}{\sqrt{x^2-a^2}} = \log \left( x \pm \sqrt{x^2-a^2} \right), \int \frac{dx}{\sqrt{x^2+1}} = \log \left( x + \sqrt{x^2+1} \right).
\]

Among the peculiar articles of integration may be reckoned the following, which are perhaps nearly all that can be useful to a learner:

1. The reduction of such a form as \(xf dx\) to another form \(f'vdx\), in which \(v\) is a different variable. Thus \((x+a)x^n dx\) can be immediately reduced to \(x^n(a+x^n)(a+nx^2)\) or \(f'vdx\), where \(v\) means \(a^n-a^2\). The second form is immediately seen to be integrable. Cases of this kind are so various that the student must form the habit of looking for them, and recognizing them at sight, as the integration of \(x^n\) of a slight transformation is required, thus: \((1-x^n)x^n dx\) when reduced to \((x^n+1)x^{n+1} dx\) clearly shows the form \(-x^n dx\), where \(v\) is \(x^n-a\).

2. The reduction of algebraical to trigonometrical functions, and the converse. Thus \((x-a)^n x^n dx\), when reduced to \((x-a)^n x^{n+1} dx\) clearly shows the form \(-x^n dx\), where \(v\) is \(x^n-a\).

3. When rational powers appear in a denominator, they...
should be transferred to the numerator by changing \( x \) into \( 1/z \). By such a transformation, we change

\[
\frac{dx}{x^{m-1}} \to \frac{z^n \cdot 1}{\sqrt[2]{(a+bx+cz^2)}},
\]

4. When an irrational root of a polynomial appears in the numerator, it should generally be transferred to the denominator: thus, \( \sqrt{X} \ dx \) should be written \( X \ dx \). By such a transformation, we change

\[
\frac{\sqrt[2]{(a+bx+cz^2)} \ dx}{\sqrt[2]{(a+bx+cz^2)}},
\]

6. When, by the addition of more simple terms to the numerator, it can be made the differential of the predominant function of the denominator, such additions, with compensating subtractions, will frequently reduce the question of integration to a more simple one. Thus we alter

\[
\frac{ax}{\sqrt[2]{(a+bx+cz^2)}},
\]

7. The last mode of proceeding, it is best to form, in general terms, an equation of reduction, as it may be called, which furnishes the key to the reduction of each case to the one below it. Thus if \( f(x) \ dx \) be considered as a function of \( n \), and called \( V_n \) integration by parts gives

\[
V_{n+1} = -\frac{e^{-x^2}}{2n} + \cdots + \int dx^n,
\]

7. In the last mode of proceeding, it is best to form, in general terms, an equation of reduction, as it may be called, which furnishes the key to the reduction of each case to the one below it. Thus if \( f(x) \ dx \) be considered as a function of \( n \), and called \( V_n \) integration by parts gives

\[
V_{n+1} = -\frac{e^{-x^2}}{2n} + \cdots + \int dx^n,
\]

8. The use of the equation of reduction depends upon our being able at last to reduce the question to that of finding a visibly known integral. Thus, if in the preceding \( n \) be an integer, we must come to \( f(x) \ dx \), or \( f(x) \ dx \), which is known. But if \( n \) were a fraction, no reduction of the value of \( f(x) \ dx \) at a time would lead to an integrable form.

9. The integrable form at which we arrive by successive reductions is called the ultimate form. It frequently happens however that the reductions proceed by two or more steps at a time, in which case two or more ultimate forms result. For instance

\[
V_n = \frac{x^n \cdot \sqrt[2]{a+bx+cz^2}}{n},
\]

Accordingly, when \( n \) is even, we are brought at last to \( V_n \), and when \( n \) is odd, to \( V_n \), or to \( \sin^{-1}(x) \) and \( -\sqrt[2]{a+bx+cz^2} \).

10. In using equations of reduction, it will be found more convenient to work upwards from the ultimate form to the case required, than in the contrary way. Thus if we want

\[
V_1 = \int f(x) \ dx,
\]

We should proceed as follows:

\[
V_0 = a, \quad V_n = x^2 - a^2,
\]

11. There are several cases in which the following extension of the theorem known by the name of John Bernoulli may be used. Let \( \alpha, \beta, \gamma, \delta \) be the successive differential coefficients of \( u \) with respect to \( x \), and let \( v_1, v_2, v_3 \), &c. be the successive integrals of \( w \) with respect to \( x \): then

\[
\text{fwdw} = \mu_{1} \cdot v_1 \cdot w + \mu_{2} \cdot v_2 \cdot w + \cdots + \mu_{n} \cdot v_n \cdot w + \cdots + \mu_{n} \cdot v_n \cdot w + \text{fwdw}.
\]

This is particularly useful when \( u \) is a rational and integral function, and \( v \) is successively integrable with ease, as when \( u = e^{x} \), \( \sin ax \), or \( \cos ax \). The process can then be continued until the remainder vanishes.

12. In the case of \( \text{fwdw} \), where \( \alpha, \beta, \gamma \) are rational and integral functions, the integration is always possible as soon as all the roots of \( \alpha \) are found. The process in Fractions Decomposers or, P. C. S., must be applied. When this is done, and the function thereby reduced to the sum of terms of the form \( A(x - a)^{-n} \), the integration gives no trouble.

13. In the case of a pair of irrational roots, \( \alpha, \beta \), \( \lambda, \mu \), each occurring once, the sum of the terms which they produce can be reduced to the form

\[
\int (A + B \cdot x) \ dx \ \mid (x - a)^{-n} \]

the integral of which is

\[
\frac{B \cdot A - A \cdot B}{\lambda - \mu} \int \frac{1}{x - a} \ dx.
\]

14. When \( \text{fwdw} \) is a function of powers of any one case of \( ax+b \), it can, if irreducible, be reduced to a rational function by assuming \( ax+b = w \), when \( m \) is the least common multiple of all the denominators in the exponents. For \( dx \) becomes \( m \cdot dx/a \), and every power of \( ax+b \) becomes an integral power of \( m \).

15. The function \( x^n (ax+b)^{r} \cdot dx \) can be integrated when either \( m \) or \( n \) is a positive integer: when \( m \) is an integer, by simple expansion; when \( m \) is a fraction, but not \( n \), by making \( ax+b = w \), and substituting. But when both \( m \) and \( n \) are negative integers, let \( z = 1/y \), and after substitution, make \( a+b = w \), and substitute for \( y \).

16. The function \( \text{fwdw} \) can be easily integrated by decomposition of fractions, the denominator never having equal roots. The same may be said if we substitute \( x^2 + 2ax + a^2 \) for \( \alpha \).

17. In \( x^n (ax+b)^{r} \cdot dx \) we have an integrable function, whenever either of the following is a positive integer:

\[
\frac{r+1}{s} \text{ or } \frac{r+1}{s} + t.
\]

The substitutions which succeed in the two cases are

\[
a + bx = \frac{e^{-x^2}}{2n} + \cdots + \int dx^n,
\]

\[
\delta \text{ being the denominator of } t.
\]

18. The following transformation involves a large number of obvious cases, and is constantly occurring. If \( \text{fwdw} \), then \( \text{fwdw} = \text{fwdw} \), and does not put \( \text{fwdw} \) into \( \text{fwdw} + \alpha \). Thus in no list would \( \text{fwdw} \) be put down, after \( \text{fwdw} \) has been given.

19. The following integrals are worth giving separately as ultimate forms:

\[
\int \frac{dx}{x^n} = \frac{1}{a} \ \cos^{-1} \frac{a}{x},
\]

\[
\int \frac{dx}{\sqrt[2]{(a+bx+c)^2}} = \frac{1}{a} \ \log \left( \frac{a+x}{a+bx+c} \right),
\]

\[
\int \frac{dx}{\sqrt[2]{(a+bx+c)^2}} = \frac{1}{a} \ \log \left( \frac{a+bx+c}{a-x} \right),
\]

\[
\int \frac{dx}{\sqrt[2]{(a+bx+c)^2}} = \frac{1}{a} \ \log \left( \frac{a+bx+c}{a-x} \right),
\]

\[
\int \frac{dx}{\sqrt[2]{(a+bx+c)^2}} = \frac{1}{a} \ \log \left( \frac{a+bx+c}{a-x} \right),
\]

the integrals which come under one or another of three previously given forms, according as \( b - 4ac \) is positive, nothing, or negative.
\[ \int \frac{dx}{\sqrt{(a+bz-x)^2}} = \frac{1}{a} \sin^{-1} \left( \frac{2bz-a}{\sqrt{a^2+b^2}} \right) \]

\[ \int \frac{dx}{\sqrt{a^2+x^2}} = \frac{1}{a} \sin^{-1} \left( \frac{x}{a} \right) \]

Let \( X = (a+bz-x) \).

Then \( \int \frac{dx}{\sqrt{aX+bx^2}} = \frac{1}{a} \sin^{-1} \left( \frac{bx-a}{\sqrt{a^2+b^2}} \right) \).

\[ \int \frac{dx}{\sqrt{a+bz-x}} = 2 \int \frac{dx}{a+bz-x} = \frac{1}{a} \log \left| \frac{a+bz-x}{a} \right| \]

29. All that it remains to give are the equations of reduction for remarkable cases. Many other differentials can be integrated in a finite form: but it is impossible to give a list of all which are sometimes useful. The transformation of unknown to known forms is one of the most necessary studies of the young mathematician.

Let \( V_{m,n} = \frac{1}{\pi} \int_0^{\pi} f(x) \sin^m x \cos^n x \, dx \).

Then \( V_{m,n} = \frac{1}{(2\pi)^{m+n+1}} \int_0^{2\pi} f(x) \sin^m x \cos^n x \, dx \).

29. Instead of giving a large number of forms which are all derivable from (29.), it will be better to give an instance of the derivation in full. Let the case be \((a+bz-x)^2 \int dx \), and let the formula be required to reduce both \( m \) and \( n \) in numerical magnitude. Here, to transform the formula in (29.)

For \( m \) write \( -m \); retain \( n \).
For \( A \) write \( 2A \); for \( B, -1 \).
For \( a,c \) write \( 1,2 \).
For \( g_1 \) write \( -m+1-n \); for \( h, -m+1+n \).
For \( x \) write \( -1 \).

The first formula becomes \((P \text{ being } 2ax-x^2)\)

\[ (2a-m+n) \int (m-n)(n-m-2m-1) = \int \frac{dx}{\sin^m x \cos^n x} \]

from which, writing \( V_{m,n} \) for \((-m,n) \) or \( \int dx \), we have

\[ V_{m,n} = \frac{1}{(2\pi)^{m+n+1}} \int_0^{2\pi} f(x) \sin^m x \cos^n x \, dx \]

If it were required to reduce \( n \) in the preceding without altering \( m \), throw the formula \( \int \frac{dx}{\sin^m x \cos^n x} \), into the form \( \int \frac{dx}{\sin^{m-n} x \cos^n x} \) and use the first of the four formulae.

All the preceding formulae involving \( \tan^p \), are particularly in use when \( n \) is a fraction, positive or negative, with the denominator 2. Those in fact form the most usual cases. Formulae involving \( \sin^p \) or \( \cos^p \) are of little use, that they are better omitted in a work in which space is of importance.

31. The following equations of reduction are those which are most commonly used:

\[ \int \frac{dx}{\cos x} = \frac{\sin^{-1} x}{x} \]

\[ \int \frac{dx}{\sin x} = \frac{\cos^{-1} x}{x} \]

\[ \int \frac{dx}{\cos^n x} = \frac{1}{n-1} \frac{\cos^{n-1} x}{x} \]

\[ \int \frac{dx}{\sin^n x} = \frac{1}{n-1} \frac{\sin^{n-1} x}{x} \]

\[ \int \frac{dx}{\sin^m \cos^n x} = \frac{1}{m-1} \frac{\sin^{m-1} \cos^{n-1} x}{x} \]

\[ \int \frac{dx}{\sin^m \cos^p x} = \frac{1}{m-1} \frac{\sin^{m-1} \cos^{p-1} x}{x} \]

\[ \int \frac{dx}{\sin^m \cos^p \sin q x} = \frac{1}{m-1} \frac{\sin^{m-1} \cos^{p-1} x}{x} \]

\[ \int \frac{dx}{\sin^m \cos^p \cos q x} = \frac{1}{m-1} \frac{\sin^{m-1} \cos^{p-1} x}{x} \]

\[ \int \frac{dx}{\sin^m \cos^p \tan q x} = \frac{1}{m-1} \frac{\sin^{m-1} \cos^{p-1} x}{x} \]

\[ \int \frac{dx}{\sin^m \cos^p \cot q x} = \frac{1}{m-1} \frac{\sin^{m-1} \cos^{p-1} x}{x} \]
32. We have given the last steps in various forms, because in all the integrals of the form \( \int x^m (a-x)^n \, dx \) depend upon them. For \( x = a \sin \theta \), the last integral becomes 
\[ -a^{m+n+1} \sin^{n+1} \theta \cos^n \theta \, d\theta. \]
We have now given most of the forms which will be useful in an ordinary work of reference. Further forms and examples will be found in many works on the integral calculus, but the largest collection is in Miller Hirsch's "Integral Calculus," Berlin, 1910, etc., a work of which there is also an English edition.

We have omitted notice of a great many such forms as \( \int x^n a^n x^k \cos x^n \, dx \), etc. which are little used, except in particular cases. When \( \int x^n a^n x^k \cos x^n \, dx \) can be integrated, it follows that \( x^n a^n \cos x^n \, dx \), can also be integrated, since the second can be made into the sum or difference of two functions of the first form, by putting for \( \cos bx \) or \( \sin bx \) their exponential values.

The question of the possibility of integration in finite terms can often be settled by the following theorem:---Integration and differentiation, with respect to different variables, are convertible operations, thus 
\[ \frac{df(x,y)}{dx} = \frac{dy}{dx} \frac{df}{dy} \]
If therefore \( f(x) \) can be found, so also can \( f(x,y) \) by differentiation.

Functions involving the transcendental forms \( \sin phi x, \cos \), etc. can sometimes be reduced to more algebraical forms by integration by parts. Thus,
\[ \int (V \sin X \cdot x = \int V \sin X \cdot \int X' \cdot x dx = \int X' \cdot x dx \]
\[ \int V \log X \cdot x dx = \int V \log X \cdot \int x dx = \int x \cdot V \log X \cdot x dx \]
in which \( X' \) means \( dX: \, dx \).

INTEGRATION, DEFINITE. In the preceding article we have given some idea of the usual modes of integration. The results, which in the present article are given under the name of definite integrals, are mostly cases in which it is possible to find an integral when both limits are given [INTEGRAL CALCULUS, P. C. X.]; but not possible to find the integral in all cases. If we can integrate \( \phi \cdot x \cdot dx \) generally, that is, if we can find the function \( \phi \cdot x \), of which \( \phi \cdot dx \), is the differential coefficient, we can always express the integral, the limit of the summation in the article just referred to, as follows:---
\[ \int_{a}^{b} \phi \cdot x \cdot dx = \phi \cdot b - \phi \cdot a \]
but it frequently happens that \( \phi \cdot x \) is a function for which this cannot be done in a finite form, except for certain values of \( a \) and \( b \). And it happens almost as frequently that these practicable values are of particular importance.

But the view of definite integrals which best shows their utility is the consideration of them as fundamental modes of expression. The ordinary symbols of algebra, it is well known, are incompetent to express in finite terms by far the greater number of integrals. Consequently the integrals themselves become modes of expression, and frequently the only ones. When we find a language with which we have much in common, which has words which cannot be translated, and we adopt the words of that language into our own. Precisely the same thing is done in the case of definite integrals. Thus in FACTORIALES, P. C. S., we adopt the integral \( \int_{a}^{b} x \cdot e^{-x} \, dx \), as the fundamental mode of expression for a function till then inaccessible, which becomes 1.2.3...when \( n \) is an integer, and remains intelligible, though not very easily found, when \( n \) is a fraction.

Further to illustrate this, let us suppose that the integral calculus had made some progress before the conception of a logarithm had been formed: a thing which might easily have happened. It would then have been found that \( \int x^{-x} \, dx \) was wholly unattainable, a function which algebra could not express in finite terms. It would therefore itself have become a mode of expression, and it would soon have been proved that
\[ \int_{a}^{b} x^{-x} \, dx + \int_{a}^{b} x^{-x} \, dx = \int_{a}^{b} x^{-x} \, dx. \]

Here then would have been an obvious indication of the existence of a function proper to be made use of in performing multiplication by means of addition, etc.; and tables of the values of \( \int x^{-x} \, dx \) would have been formed by the method of quadratures [QUADRATURES, P. C.] or otherwise; which would, so it happens, have been a much easier task than that which fell on the first calculators of logarithms. For all this we are now enabled to perform by knowing logarithms and their properties; so that \( \int_{a}^{b} e^{-x} \, dx \) is seen to be \( x + C \), and \( \int_{a}^{b} x^{-x} \, dx \) to be \( \log x + C \), the logarithms throughout this article being Napieran. But we are not equally ready for \( \int_{a}^{b} \phi \cdot x \), or for \( \int_{a}^{b} \phi \cdot x \) (except when \( n \) is integer) or for \( \cos x \cdot dx \) and accordingly we are obliged to study the properties of these functions as fundamental modes of expression.

To give some idea of the use of this view, we exhibit a mode of solving the following partial differential equation, 
\[ \frac{dx}{dt} = \frac{a}{d \frac{du}{d \theta}} \]
the general solution of which cannot be expressed in finite terms. It will easily be seen that \( C \frac{dX}{dX} = \phi \cdot x \) is a solution for any value of \( C \) and \( \phi \), provided only that \( \mu = \cos \phi \), and also that the sum of any number of such terms is a solution. Hence we assume an indefinite number of such terms, giving to \( C \) the form \( \phi \cdot x \), and summing with them such values of \( \phi \) as will make the whole represent
\[ \int \phi \cdot x \cdot e^{-\phi \cdot x} \, dx, \]
and we then see that this integral is a solution or general value of \( u \), whatever the function \( \phi \) may be, and whatever may be the values of \( a \) and \( b \). By a reduction which is rendered easy by some of the results presently mentioned, this solution is thrown into the form
\[ u = \int \phi \cdot x \cdot e^{-\phi \cdot x} \, dx + \psi \cdot x \]
where \( \psi \) may be the symbol of any function. From this it is clear that the given differential equation has numberless solutions which ordinary symbols are incapable of expressing in finite terms. The treatise in the Library of Useful Knowledge on the Differential Calculus, Gregory's 'Examples of the Differential Calculus,' and that in the Mathematical and Physical Journal, contain various examples of this mode of expression applied to differential equations.

We now proceed to give a selection from the enormous number of definite integrals which has been given. They have been found by detached methods, so that we could not attempt to give anything more than the results. Our article is intended for reference to the forms which it is probable will be found in future elementary works, and which the mathematical reader may also wish to refer to. In order to avoid risk of broken or dropped letters, in an article in which the correct printing of the limits is of the utmost importance, we shall print what is usually denoted by \( \int \phi \cdot x \) in the following way, \( \int \phi \cdot x \) [a, b]. Any conditions as to the values of constants will be expressed before the integral.
It need hardly be said that the article *Factorials, P. C. S.*, must be considered as a part of the present one.

Among the integrals which clearly depend on, or are connected with, factorials, are the following:

\[ (m + 1 < n) \int \frac{x^{m-1} \, dx}{(1 + x^2)^n} = \frac{\Gamma(m + 1)}{\Gamma(n \cdot m)} \cdot \frac{1}{n} \left( \frac{\pi}{\sin \left( \frac{\pi}{n} \right)} \right) \]

\[ (m < n) \int \frac{x^{m-1} \, dx}{(1 + x^2)^n} = \frac{\Gamma(m + 1)}{\Gamma(n \cdot m - 1)} \cdot \frac{1}{n} \left( \frac{\pi}{\sin \left( \frac{\pi}{n} \right)} \right) \]

(from these come)

\[ \int \cos \varphi \, d\varphi \to [0, \infty] = 0 \quad \text{and} \quad \int \sin \varphi \, d\varphi \to [0, \infty] = 1 \]

from which it follows that the double integrals which have been much used, long before they were openly expressed, are:

\[ \sin \infty = 0 \quad \cos \infty = 0 \]

Some difference of opinion exists about these equations, which, in fact, involve a great deal of what has been done by mathematicians in the last twenty years.

When \( a \) and \( n \) are both positive

\[ \int \frac{\cos \varphi \cdot x^{n-1} \, d\varphi}{(1 + x^2)^n} = \frac{\Gamma(n + 1)}{\Gamma(n + m \cdot a)} \cdot \frac{1}{m} \left( \frac{\pi}{\sin \left( \frac{\pi}{n} \right)} \right) \]

\[ \int \frac{\sin \varphi \cdot x^{n-1} \, d\varphi}{(1 + x^2)^n} = \frac{\Gamma(n + 1)}{\Gamma(n + m \cdot a)} \cdot \frac{1}{m} \left( \frac{\pi}{\sin \left( \frac{\pi}{n} \right)} \right) \]

or

\[ \int \cos \varphi \cdot x^{n-1} \, d\varphi \to [0, \infty] = 1 \quad \text{and} \quad \int \sin \varphi \cdot x^{n-1} \, d\varphi \to [0, \infty] = 1 \]

This is a specimen of a sort of discontinuity which very frequently occurs, and from not attending to which mistakes have often arisen.

If we call \( \frac{1}{2} \) the hyperbolic cosine and sine of \( x \), and denote them by \( \cosh x \) and \( \sinh x \), we have the limits being \( 0 \) and \( \infty \), and a being less than \( \pi \),

\[ \int_{0}^{\infty} \sin \varphi \, d\varphi = \frac{\pi}{2} \quad \text{and} \quad \int_{0}^{\infty} \cos \varphi \, d\varphi = \frac{\pi}{2} \]

The integral \( n \int \frac{\varphi^{n-1} \, d\varphi}{(1 - \varphi^2)^n} \to [0, \infty] \) is the \( n \)th number of Bernoulli, meaning opposite to which \( 2a - 1 \) is written in the article cited. As a specimen of the reduction of definite integrals, the integrals

\[ \int_{0}^{\infty} \frac{\cosh \varphi \, d\varphi}{1 + \varphi^4} \quad \text{and} \quad \int_{0}^{\infty} \frac{\sinh \varphi \, d\varphi}{1 + \varphi^4} \to [0, \infty] \]

are severally equal to

\[ \frac{\sqrt{\pi}}{2} \int_{-\infty}^{\infty} \frac{dx}{1 + x^4} \quad \text{the first having} \quad -a, \text{the second} \quad +a. \]

Also

\[ \int_{-\infty}^{\infty} \frac{dt}{1 + \varphi^2 \to [0, \infty]} = \pi \text{, the} \int_{0}^{\infty} \frac{t \, dt}{1 + \varphi^2} \to [a, \infty]\]

The following is fundamentally important,

\[ \int_{0}^{\infty} \frac{\cos \varphi \, d\varphi}{1 + \varphi^2} \to [0, \infty] = \frac{\pi}{2} \int_{0}^{\infty} \frac{dt}{1 + \varphi^2} \]

* With respect to these equations, it must be observed that they are not to have their algebraical consequences; thus, since \( \sin \) is not 0, but \( \frac{\pi}{2} \). The truth seems to be, \( \pi \) as yet appears, that any function \( \varphi \), which becomes infinitely small in form, by the angle \( \varphi \) becoming infinite, is properly represented by \( \sin \varphi \to [0, \varphi] \).

For this reason, \( \sin \) and \( \cos \) are often used as such, but it is not considered correct to do so.
The integral \( \int \frac{dx}{x \log x} \) has been tabulated [Diff. Calc., L. U. K., p. 662] by Solder, and a great many integrals may be found from it. Solder proposes to call it the *Logarithm-integral* of \( a \), and to denote it by the abbreviation \( \text{li} \ a \). Adopting this notation, we have then, both in definite and indefinite forms,

\[
\int \frac{dx}{x \log x} = \text{li} \ a + \int_1^x \frac{dt}{t \log t} = \text{li} \ x + \int_1^x \frac{dt}{t} = \text{li} \ x.
\]

and so on.

Of miscellaneous integrals there is an immense number, of which we give a few instances:

\[
\begin{align*}
\left(1-x^m\right) \left(1-y^n\right) d \frac{x}{(1-x)} & = \text{log} \left(\frac{1+m}{1+y} \right) \Gamma\left(1+m+n\right) \gamma \left(1+m\right) \gamma\left(1+n\right) \\
\int_0^1 x \tan x dx & = \frac{\pi}{2} \sqrt{x} + 1 \\
\int_0^1 x \cot x dx & = \frac{\pi}{2} \sqrt{x} - 1
\end{align*}
\]

(a pos.) \( \int_0^\infty \sin bx \cdot x dx = \text{tan}^{-1} (b) \) 

\[
\text{if neither } a \text{ nor } b \text{ be negative}.
\]

\[
\int_0^\infty \frac{x \sin x dx}{x^2 + a^2} \log x = \frac{\pi}{2} \text{log} \left(1 + \frac{1}{a}\right)
\]

according as \( a \) is less or greater than unity.

Among the means of producing or using definite integrals which are comprehensive enough to deserve the name of methods, there are four which particularly deserve the attention of elementary writers.

The first is Laplace's mode of finding the approximate value of a definite integral in which large constant exponents occur. Let \( \phi x \) be a function of \( x \), such as \( x^{-a} \) or \( x^a \) \( (x-1)^{-a} \), &c., in which \( n, m, \&c. \) are considerable exponents. Let this function vanish when \( x = a \) and \( x = b \), and, continuing positive and finite throughout the interval, let it come to its maximum \( Y \) when \( x = X \). Let \( \varepsilon \) mean the value of the second differential coefficient of \( \log \phi x \) when \( x = X \), and assume \( \phi x = Y e^{\varepsilon x} \). Then

\[
\int \phi x dx = Y \sqrt{\frac{2}{\varepsilon}} e^{-\varepsilon t} dt
\]

provided that the limiting values of \( t \) on the second side are those which, in the equation \( \phi x = Y e^{\varepsilon x} \), belong to the limiting values of \( x \) taken on the first side. The best approximating cases are as follows. First, when \( a \) and \( b \) are the limiting values of \( x \), in which case \(-\infty \) and \(+\infty\) are those of \( t \), and the result is

\[
\int \phi x dx = \sqrt{2} \int e^{-\varepsilon x} dt
\]

Secondly, when the limiting values of \( x \) are \( X \pm \xi \), \( \xi \) being small.

In this case

\[
\int \phi x dx [X \pm \xi] = \sqrt{2} \int e^{-\varepsilon x} dt \left[0, \xi, \sqrt{\frac{2}{\varepsilon}} \right]
\]

This method is found, by itself, almost sufficient to meet the wants of the more complicated problems in the theory of probabilities.

Secondly, Fourier's theorem, as it is usually called, by which a discontinuous function can be expressed. This theorem is as follows,

\[
\phi x = \frac{1}{\pi} \int \cos w (x-v) \cdot \phi v dv dv,
\]

from \( v = -\infty \) to \( v = +\infty \), and from \( w = 0 \) to \( w = \infty \). Or thus: the equation

\[
\phi x = \frac{1}{\pi} \int_0^\infty \cos w (x-v) \cdot \phi v dv dv,
\]

is one which, for all values of \( x \), approaches without limit to truth, as \( k \) is diminished without limit positively. But if instead of the limits \( +\infty \) and \(+\infty\), for \( v \), we write \( a \) and \( b \), \( a \) being less than \( b \), then

\[
\phi x = \frac{1}{\pi} \int_a^b \cos w (x-v) \cdot \phi v dv dv
\]

is a discontinuous function, as follows: From \( x = -\infty \) to \( x = a \) exclusive, it is nothing: when \( x = a \), it is \( \phi a \); from \( x = a \) to \( x = b \) both exclusive, it is \( \phi x \); when \( x = b \), it is \( \phi b \); and from \( x = b \) to \( x = \infty \) it is nothing.

Thirdly, the following methods of expanding a function in series of sines and cosines has been extensively used by Lagrange, Poisson, and Fourier. We give it in the most general form after the manner of Poisson. Let

\[
\phi x = A_0 + A_1 \cos \frac{x}{3} \theta + A_2 \cos \frac{x}{4} \theta + \ldots
\]

then for every value of \( x \) from \( x = 0 \) to \( x = \infty \), both inclusive, this equation is true if

\[
A_0 = \frac{1}{\pi} \int \phi dx [0, \infty] \theta.
\]

Again, the equation

\[
\phi x = B_1 \sin \frac{x}{3} \theta + B_2 \sin \frac{x}{4} \theta + \ldots
\]

is true from \( x = 0 \) to \( x = \infty \), both exclusive, if

\[
B_1 = \frac{1}{\pi} \int \phi dx [0, \infty] \theta.
\]

Further, the equation

\[
\phi x = A_0 + A_1 \cos \frac{x}{3} \theta + A_2 \cos \frac{x}{4} \theta + \ldots + B_1 \sin \frac{x}{3} \theta + B_2 \sin \frac{x}{4} \theta + \ldots
\]

is true for all values of \( x \) from \( x = 0 \) to \( x = \infty \), both exclusive (becoming \( \phi x \) when \( x = \infty \)) if

\[
A_0 = \frac{1}{\pi} \int \phi dx [0, \infty] \theta \text{ and } B_1 = \frac{1}{\pi} \int \phi dx [0, \infty] \theta.
\]

But write \( 2l \) instead of \( \infty \), in the limits only, or write \( [0, 2l] \) instead of \( [0, \infty] \) and the equation becomes true for all values of \( x \) from \( 0 \) to \( 2l \), both inclusive.

Fourthly, we shall give two cases of the method deduced by Cauchy, as specimens: the complete method itself has some difficulties which are not yet overcome.

First, let \( \phi x \) be such a function of \( x \) that \( \phi (x+y) \sqrt{-1} \) vanishes when \( x = -\infty \) or \(+\infty\), whatever \( y \) may be, and when \( y \) equals \( \varepsilon \), whatever \( x \) may be. For every root of the form \( a+b\sqrt{-1} \) (\( a \) being either positive or negative, and \( b \) being positive, but both finite) which makes \( \phi x \) infinite, let \( (x-a-b\sqrt{-1}) \phi x \) be finite; calculate the value of this last product for each root. For every real root \( a \) of \( \phi x = \infty \) (\( x = 0 \) not being one) calculate half the value of \( (x-a) \phi x \). Let the sum of all these values and half values be \( P \). Then

\[
\int \phi dx [\infty,-\infty] = e^{iP}.
\]

Secondly, let \( \phi x \) be such a function that \( \phi (x+y) \sqrt{-1} \) vanishes when \( x = +\infty \) or \(-\infty \) independently of \( y \), and when \( y = +\infty \) or \(-\infty \) independently of \( x \). Take the imaginary roots only which make \( \phi x \) infinite, and let \( (x-a-b\sqrt{-1}) \phi x \) be always finite when \( x+a+b\sqrt{-1} \) is one of those roots, and \( x = a+b\sqrt{-1} \). Let the sum of all the values of the last product, for the cases in which \( b \) is positive, be \( P \); and for the cases in which \( b \) is negative let it be \( Q \). Then

\[
\int \phi dx [\infty,-\infty] = e^{i(P-Q)}.
\]

The subject of definite integrals is one in which the difficulties which have always appeared at the boundaries of mathematical knowledge are constantly met with. The consequence is, considerable differences of opinion about many points. On these the student who desires to use the higher parts of analysis must hope to form his opinion independently, when his reading and reflection are sufficient for the purpose. Most of these difficulties belong, in principle, to that va-
pauses the use of divergent series, which is the most important mathematical question now under discussion. If we were to find for the funeral expenses, as we well know, that a divergent series would one day take their undisputed place among well-understood objects of analysis, as negative quantities and their logarithms, imaginary quantities and their exponential decompositions, it would be a most interesting reflection, and discontinuous solutions of differential equations, &c., have successively done, each under a fire of objections which has well served the progress of science, by the defensive retorts of the 

It has required necessary it is fortunate for analysis that so many of those who find difficulties propose the entire rejection of the symbols or methods in which the dispute is conducted, or in some instance of it, that a distance of any rejection to efforts which they perhaps would not make, if they had only to meet the doubts of allies, instead of the attacks of opponents. That the symbolic expressions of which we are speaking, will never vanish out of remembrance, we may confidently predict: of all the points of difficulty of which we have spoken, it may be said, in the words of Horace

*Naturne expelles formam, tamen usque recurrit:

they will come, and will demand explanation until they get it. They will conquer by numbers, as Fontenelle said the symbol of infinity had done. And it is to be hoped and expected that, however the battle may be decided, the intelligence, the appearance of a successor, to excite new efforts, and be the stimulating cause of further progress. We should be sorry to think we had arrived at the *last impossibilities* of pure mathematics.

**INTERDICT, in the law of Scotland, supplies the place of an injunction from a court of equity in England. It is a prohibitory order, forbidding some act from being done, and it may be given on the application of any person who would be injured by the performance of the act. It may be issued by the Court of Session, or by the Sheriff's Court. Interdicts in the Court of Session are frequently obtained for preventing inferior courts, or courts of limited operation, such as the ecclesiastical courts, from exceeding their jurisdiction. To this end the form was frequently adopted in the late dispute in the ecclesiastical courts, which has been referred to above. (Allllus. Church, P.C. S.) Interdict is applied for by what is called a 'Note of Suspension and Interdict' presented to the Lord Ordinary on the Bill. In pressing matters, interim interdict is awarded before the parties are heard, but in the general case injunction is given to the other party, who gives in answers. If there are means by which the applicant's interests can be kept safe, as by the finding of security, or otherwise, the interim interdict will not be granted, but the 'vote' will be passed to try the question, and the matter will proceed as an ordinary litigation.

**INTERMENT. [INTERMENT, P.C.] Of late years the subvention of interments in England has increased, and a great amount of information has been collected. Though opinions are not unanimous, the evidence, the further it is examined, appears to prove that emigrants from crowded burial-places, or from overcrowded churches, frequently increase the health of the persons who live near them; and that these emigrants when sufficiently concentrated may produce speedy death. The general conclusion that all interventions in churches or in towns are essentially an injurious and dangerous tendency (Report on the Practice of Interment in Towns), is at least made a strong probability, and strong enough, coupled with other reasons, to justify the legislature in forbidding such interments, and placing all burying-grounds under such regulations as may prevent the effluvia from the dead from becoming detrimental to the health of the living. The Report to which reference has been made contains, in addition to the evidence on the injurious effects of overcrowded burial-places, much valuable information on the injury to health caused, particularly among the poor, by the delay in interments. The following remark will show the nature and extent of this evil: 'In a large proportion of cases in the metropolis and in some of the manufacturing districts, one room serves for one family of the labouring classes: it is the sitting-room, the bedroom, their dining-room, and bed-chamber. Among the poor in some parts of London the average time that a body is kept is about a week, which sometimes arises from inability to raise money; and it is quite possible that in the case of others there is only a single apartment, the dead and the living occupy it together.' The injurious consequences to health from the presence of a dead body sometimes in a state of rapid decomposition, in ill-ventilated apartments, can be inferred, particularly when death has been the consequence of malignant disease, cannot be disputed; and the effect on the living is demoralizing. The expense of funerals is another head which is examined in this report, where it is well remarked that 'the expense of interments, though it falls with the greatest severity on the poorest classes, acts as a most severe check on the energy of the class of so education and comfort. The cost of interment in London varies from 4l. for a labourer to 1000l. for a gentleman; for persons of the condition of a gentleman it is stated that 150l. would be a low average. But these charges do not include anything but the undertaker's bill. The account of the details of an expensive funeral, which is strictly the heraldic array of a baronial funeral, the two men who stand at the doors being supposed to be the two porters of the castle, are, &c., is ludicrous enough; but the disposition to laugh is checked by considering the pecuniary embarrassment which this absurd display often entails on the survivors. Many persons incur a heavy debt in the expenses of a funeral, and this is not unusual for poor people to liquidate such debt by instalments paid weekly, or at other short periods.

The subject of interment, like many others relating to the economy of society, is full of interest and significance. The general attention on the part of the state. It may be said, let every man bury his dead as he best can, and as he chooses. With respect to the rich, the expense is an absurd waste of money, and the expense of the middling classes, it is a heavy burden; but to the poor, interment of their dead is often almost an impossibility. To diminish these expenses, to secure the decency of interment amongst all classes, and particularly amongst the lower classes, is a matter of the highest interest. The living in the metropolis may be taken at 146 l. 9d. per head. But owing to circumstances, fully explained in the Report, even this lavish expenditure does not secure the proper and solemn discharge of the funeral ceremony, which, in crowded and busy districts, seems to be totally impracticable. It is fully shown that the expenses of funerals may be greatly reduced, and the due performance of the religious ceremonies may be secured by other arrangements. The establishment of cemeteries by Joint Stock Companies has done something by diminishing the amount of interments in crowded places, but the expenses of interment have perhaps not been at all diminished by them.

The Report concludes (p. 197) with a summary of the evils which require remedies; and there is not one of the evils which has not been touched on, the existence of opinion as to the degree in which the evils exist; but none as to the existence itself. The remedies that are suggested for these evils appear to have been well considered, though, when an evil is ascertained to exist, we may always agree as to the best remedy. One of the proposed remedies, which involves many important considerations, and would probably meet with some opposition, is 'that r tions.'
clements of a suitable description ought to be provided and maintained (as to the material arrangements) under the direction of officers duly qualified for the care of the public health.' Another is, 'that for the abatement of oppressive charges for funeral materials, decorations, and services, provided (in conformity with the best established practice abroad) by the officers having charge of the national cemeteries, for the supply of the requisite materials and services, to all classes, but especially the poor, the means of respectable interment, at reduced and moderate prices, suitable to the state of the deceased and the condition of the survivors.' The numerous matters contained in the Report can, for brevity's sake, be consulted by all who take an interest in the well-being of society, as a most valuable contribution to the statistics of civilized life.

(A Supplementary Report on the Results of a Special Inquiry as to the Practice of Intemperance in Towns, made at the request of her Majesty's principal Secretary of State for the Home Department, by Edwin Chadwick, Esq. Barrister-at-Law. London, 1843.)

INTERNATIONAL LAW. This term was originally applied by Bentham to what was previously called the 'law of nations,' and it has been generally received as more apt designation than that which it superseded. When the term 'law of nations' was first used, that of 'law of peace and war' was sometimes employed as a synonyme, and as indicative of the boundaries of the subject. It was thus in the proper sense restricted to the disputes which governments might have with each other, and did not in general apply to questions between subjects of different states, arising out of the position of the states with regard to each other, or out of the differences in the internal laws of the separate states. But under the pressure of the strong necessity of having a distinct indication of the whole of these subjects, intimately connected with each other as they will be found to be, can be comprehended and examined, and thus several arbitrary distinctions and exclusions avoided, show how these subjects are interwoven, the following instances may be taken:—A port is put in a state of blockade; a vessel of war of a neutral power breaks the blockade: this is distinctly a question between nations, to be provided for by the law of peace and war; in as far as there are any contumelious rules on the subject, and the parties will submit to them. But suppose a merchant vessel belonging to a subject of a neutral power attempts an infringement of the blockade, and is seized—here there is no question between nations in the first place. The matter is adjudicated on in the country which has made the seizure, as absolutely and unconditionally as if it were a question of internal smuggling, and it will depend on the extent to which just rules guide the judicature of that country, and not on any question settled between contending powers, whether any respect will be paid to the party's claim. The parties may plead in their own favour, on the ground of the comity of nations, or otherwise. But there is a third class of cases most intimately linked with these latter, but which are completely independent of any treaties, declarations, or other acts by neutral powers; that of throwing the war into each other. They arise entirely out of the internal laws of the respective nations of the world, in as far as they differ from each other.

The 'conflict of laws' is a term very generally applied to this branch of international law, and the circumstances in which it comes into operation are when the judicial settlement of the question takes place in one country, but some of the circumstances of which cognizance had to be taken have occurred in some other country where the law applicable to the matter is different. One of the most common illustrations of this subject is,—a judicial inquiry in England whether a marriage has taken place in Scotland according to the law of that country; or an inquiry in Scotland whether a marriage has taken place according to the law of England; in either of which cases there will generally be the further and nicer question, Which country's law ought to prevail as the criterion?

Thus the three leading departments of international law are—

1. The principles that should regulate the conduct of states to each other.
2. The principles that should regulate the rights and obligations of private parties, arising out of the conduct of states to each other.
3. The principles that should regulate the rights and obligations of private parties, then they are affected by the separate internal codes of distinct nations.

The first of these has been the principal subject of the well-known works of Grotius, Puffendorff, Vattel, and other publicists, who have derived from general principles of morality and justice a series of minute abstract rules for the conduct of nations towards each other, and subsidiary for the conduct of their subjects in relation to international questions. It has been usual to call this department the 'Law of Nature,' though it is not sufficiently established to be classed as so, while it is true that although it has not the support of the authority of any legislature, it is founded on the universal principles of natural justice.

It is clear that thus in its large features, as a rule for the conduct of independent communities towards each other, the Law of Nations wants one essential feature of that which is properly a national law, it is not of itself capable of enrolment as a rule binding on the world, which is rarely infringed. But in the more important questions, regarding what is a justifiable ground for declaring war? what territory a nation is entitled to the sovereignty of? what is a legitimate way of enforcing compliance to guarantees? and the like, the rules of the publicists are on principle, as the practice of nations has been far from regular, and has been, as every reader of history knows, influenced by the relative strength of the parties, the ancient authority of international law, and the like. The latter writers on this subject have from this circumstance directed their attention more to the means by which any system of international law can be enforced, than to minute and abstract statements of what may be theoretically just, but has little chance of being enforced. They have found several circumstances which have an influence in the preservation of international justice, though of course there are no absolute sanctions which can give it the uniformity and consistency of internal laws.

The combinations for the preservation of what is called the Balance of Power [Balance of Powers, P. C.] are among the most useful restrictions of ambition. All periods of history furnish illustrations of this principle. Hume found that the Peloponnesian war was carried on for the preservation of the balance of power against Athens. He added a noted illustration of combination to prevent universal conquest on the part of the French. The safety of small states from being absorbed by their larger neighbours, is in the preservation of the balance of power also to be desired. Thus the jealousy of rulers is one barrier to national injustice. Another is public opinion: sometimes of that nation whose rulers would be prepared to commit injustice—sometimes of another nation with a very limited extent that the public feeling of a despotic government can check the grasping spirit of its rulers; but the public feeling of the constitutional and democratic states is the great check on the injustice that might be perpetrated by a nation when it becomes so powerful as Great Britain.

The seizure of the Danish fleet by the English has been a subject of warm censure in this country. Necessity—even the plea that Napoleon would have used the fleet to invade our own shores—has not been accepted in palliation of the act; and the manner in which it has been canvassed is very likely to prevent any British government from adopting the precedent. The seizure was taken in violation of the law, and injustice condemned by the public feeling of countries other than those by which it was perpetrated; and it may be questioned whether the states which accomplished the partition may not have been influenced by it. Good fame in the conduct of nations is like respectability in private circles, a source of power through external support; and the conduct of Russia towards Poland has frequently diverted from the former country, by its policy of free nations. It need scarcely be observed that the press, whether fugitive or permanent, is the most powerful organ of this public opinion, and that the views entertained there, as well by patriots, jurists, and moment, in the preservation of international justice. Among the principal subjects of dispute in this department of international law are—the sovereignty of territory and the proper boundaries of states, as in the question at present under debate re-
garding the Oregon territory in North America; questions as to discovery and first occupancy of barbarous countries; questions as to exploration; the frequent occurrence of disputes between the nations; and, here there is a well-known distinction between the broad ocean and the narrow seas that lie in parochial territories; questions regarding the right of navigation in rivers which form boundaries; the right of first occupation of lands or states on opposite banks; questions as to the right of fishing, hunting, &c.; and questions as to the right of trade with particularizing persons. A very frequent cause of international disputes has been frequently had recourse to late in a submission to the arbitration of a neutral power. Pride and the spirit of not yielding to intimations of submission by any method whatever, have been the great reasons of a nation's renunciation of another's claim, than the desire to keep what is demanded. In such a case the national pride is not injured when that which is yielded to is the award of a neutral party, not the demand of an opponent. It has been suggested by Bentham and Mill that the civilized states of the world should establish themselves a congress, which should adjudicate on all disputes between its members, the members being excluded from voting in their own disputes.

The Second department into which we have considered international law divided—the rights and obligations of individuals as affected by the conduct of states towards each other. It is not necessary to go into the various theoretical matters; but it has, perhaps, received so much practical illustration as it did in the British courts, particularly in the Prize Admiralty Court, during the late wars. In a country like ours, where the existence of commerce and the interests of a powerful merchant navy are so indissolubly connected, the bench should give effect to the national policy of the government, whatever that may be. But in England it was the rule that foreigners as well as nations were entitled to the same judicial redress from the courts that could be given to subjects of the same country. If the proceedings of the government were at variance with the rights of parties according to the law of peace and war, individuals might have redress. Thus, when Great Britain, in opposition to the Berlin decrees, tried to establish a paper blockade, that is to say, by force of orders in council to declare places to be under blockade, whether there were a force present to support the blockade, as a matter of public law, was submitted to the courts. The notion of a complete blockade, it is included that the besieging force can apply its power to every point in the blockaded state. If it cannot, it is no blockade of that quarter where its power cannot be brought to bear.'

It has frequently been observed, that as to all departments of the law of nations, uncivilized countries are at the mercy of the civilized: that not having any means of reciprocating the action of international laws, from their having no systematic judicatures of their own, they have not even the fruitful tenor of generally received opinions as to what the conduct of independent nations towards each other ought to be, for their proceeding, in their relations as a state, has been often the act of the child of civilization, which can eloquently appeal to the law of nations, is feebly protected against the injustice of a strong nation, still less effectually are a barbarous community, who never heard of the obiter dicta of the court, and who are unknown to the acknowledged principles, protected by it; and, in regard to them, the humanity and conscience of the powerful nations coming in contact with them are their protection, rather than any rules of international law. Thus when, as in the instances of a colonial government or otherwise, such a nation as the British has to deal with the inhabitants of a barbarous country, it cannot be said that these inhabitants have the law of nations to appeal to if they are unjustly treated, and there is no sanction for their being well and humanly used but the morality and conscience of the British nation and its government. It is also the case that nations had in former times disregarded all feelings of common humanity in their intercourse with inferior races, the history of colonization, and especially that relating to the continent of America, is a horrid record. In later days higher notions have been entertained of the responsibility of superior power, and the civilized man has in some measure ceased to make his first advances to the notice of the barbarian in the character of a murderer and a pillager. Britain and the United States have shown an example of giving rights to other nations, as to be the protector of barbarous races from the oppression of others, in her efforts for the abolition of the slave trade and the preservation of aboriginal nations. These efforts, when extended to all the aboriginal races of nations, have introduced some necessary exceptions to the rules of international law applicable to the rights of persons. This has consisted in the necessity of treating those who are injured by the slave trade, viz. the slaves carried off, as if they were subjects of this country subjected to injury, while the slave traders who have been indicted the trial was a general case as if they were subjects of this country doing the injury. The effect of this state of matters, as an exceptional principle in international law, sometimes occurs difficult in the case of the English, who have on some occasions had been captured and taken possession of. The crew rose, and putting the captors to death, recaptured the vessel. They were tried and condemned to death for murder in an English court; and the vessel was, in the same manner, treated, as if it had not the plea, that, as the capture had taken place under our laws, not their laws, they were entitled to regain possession. But by a notification which the British government held it right, in fact, to treat the ship as a prison, and the captured seamen as persons in a British prison. On the question however coming before all the judges, the conviction was declared invalid, the principal ground of the reversal being, that the vessel not having slaves on board was not legally liable to seizure. In those cases where it is necessary to diverge from the general principle of international law, for the protection of the weak, it is the mission of enlightened and enlightened motives of proceeding is a guarantee for its being beneficially exercised.

The rights of individuals have sometimes been so much affected by the conduct of nations towards each other, that the same questions in the same cases occur in courts of searching American merchant vessels for British seamen. On the subject of the present dissatisfaction of the question as to this right of search, see Redding in his Maritime International Law (4, c. 43-44). 'Unfortunates,' says Redding, 'right of search of right was left undecided either way by the hastily concluded treaty of Ghent in 1814, which terminated the war between the parent state and what were originally her colonies. And as the divergence in the personal appearance, language, habits, and manners of the inhabitants of the two countries was not likely, for generations, to be such as to facilitate the discrimination of the subjects, questions of this nature must be regretted the question was not subsequently settled by the negotiations of 1818 upon the equitable footing of regular authentic lists or registers of British and American seamen being made up and kept, and of the nationality of the seamen being thereby determined.'

The Third division of international law is that which most properly comes under the head of 'Conflict of Laws,' viz. the principles that should regulate the rights and obligations of private parties when they are affected by the separate internal codes of distinct nations. This has some points in common with the preceding department of the subject. It involves the principles of international law, and, not as questions of existence, but questions with its states; and the adjustment of each question depends on the view taken by the law of the country to which the individual or his property is amenable. But it must be remembered that the circumstances in which disputes may arise are not in the conduct of one nation towards another, but in differences between the internal laws of the countries, which internal laws dissolve, not because the one nation has a dispute with the other, but in the general case because its legislators have taken its internal situation solely into consideration, and have overlooked the existence of other nations. There can be no part of the world where this species of international law can be so well illustrated as in the United States—a collection of communities, each having an internal system of administration, but each acting on principles of harmony and alliance with the other states. It is thus natural that America should have produced the best work on the subject, in Professor Story's 'Commentaries on the Conflict of Laws Foreign and Domestic, in regard to Contracts, Rights, and Remedies,' and especially regarding the Marriages, Divorces, Wills, Successions, and Judgments, of which two editions are now known and esteemed in this country. The leading rule of international law in this department is this, that each civil law system has its own peculiar tendency to give private right of action, not in favor of a wrong to the other nation, unless its own laws or the general principles of justice are thereby invaded. We have the broadest and most distinct illustrations of this rule in the case of private crime against persons property. In conformity with
this principle, treaties were lately made with France and the United States of America, for enforcing which, in this country, two acts of parliament were passed (6 & 7 Vict. c. 75 and c. 76), by which a secretary of state, on the requisition of the ambassador or other representative of France or the United States, was warranted to sign an embassy to a person accused of a crime, a magistrate being enjoined to put it in force on his being satisfied that the charge is of such a nature as would authorize him to commit a person charged with perpetrating it in his own jurisdiction. [Cf. excerpts from TREATIES, P. C. S.] But it has been a rule in many countries, and particularly in our own, that no aid is to be given for the enforcement of the political laws of foreign states. As in other branches of international law, our embedded principles on the subject of slavery have here been the cause of perplexing difficulties. With slave-holding countries slavery comes to be a question of property, but with us it can only be a question of government; and we cannot view any rules regarding property in slaves as laws relating to private rights, an infringement of which, when held to be criminal in the slave-holding country, must be so also here. Accordingly, in the celebrated case of the Creole, in November, 1841, when certain American slaves escaped and found protection in a British settlement, it was found that we could not send them back to their owners who had with slave-traders stolen their own persons from the custody of their proprietors.

As on the one hand the criminal law is that to which this department of international law most broadly and distinctly applies, so on the other hand the property is that to which it has generally the least reference. The reasons of this distinction are very obvious: his own personal conduct is that object of the law which a man most completely controls, and the question from one country to another, his connection with landed property is the relation in which a tribunal out of the country in which the property is, can have the least chance of adjudicating. Between these extremes there are many cases of comparative positions in each other, and regarding contracts as to moveable or personal property. It came thus to be a general principle, that rights connected with landed property must always be settled by the laws of the land in which it lies, whereas questions regarding other property might be subjected to other criteria of jurisdiction. Perhaps historical circumstances in the early history of the European nations favoured this division. The various tribes which occupied the territory of the Roman empire appear to have carried with them their own peculiar laws and customs. Savigny quotes a letter from Bishop Agobardus, in which he says it often happens that five men, each under a different law, may be found walking or sitting together—a state of society at this day exemplified in some oriental nations. Among all these distinct tribes the feudal system arose as the general law of feudal territorial law. But a series of circumstances which need not be here narrated, the civil or Roman law became the ruling principle as to persons in their relation to each other when that relation was not of a feudal character. It contains many clauses regarding landed property in the common law of England has perhaps had the least affinity with the other European codes. But it has fortunately happened that those departments of the law with which international questions are chiefly concerned,—the consularial and the admiralty law, have been considered as the legitimate offspring of the civil law, and have adopted in a great measure its principles as they have been in practice throughout Europe. The mercantile law in general of England has accommodated itself to the custom of merchants; and this custom has in a great measure arisen out of the adaptation to modern commerce of the principles of the civil law. The portion of the commercial code of England which is least in harmony with that of other countries is perhaps the bankruptcy law, which, being statutory, has not so pliantly adapted itself to the exigencies of foreign commerce as the consularodial portions of the commercial code of England have done. Thus, under the bankruptcy or bankruptcy statute of Scotland, which was supposed to give the trustee or assignee full power for obtaining possession of the bankrupt's property in all parts of the world, it was found that he had no power to apply this to the bankruptcy in England—the right of the trustee being that of an assignee merely, and a right to a debt being a chose in action, and therefore not within the scope of the discovery law of England. See Jeffrey v. M'Taggart, 6 M. & S. (K. B.), 120. The law of bankruptcy appears to be one of the most difficult of adjustment to international principles. There are clauses in the bankruptcy and insolvency acts of England by which, through registration of the vesting order, the assignee became invested with all real or landed property in any of the British dominions where a conveyance of such property requires to be recorded. (See 1 & 2 Wm. IV. c. 56, § 27, and 1 & 2 Vict. c. 110, § 46.) It could not have been the intention of the framers of these laws to vest a person to whom a bankruptcy has been decreed in the strict interpretation of the English provision that no such preliminary was necessary, and that the registration of the vesting order was sufficient. (Katurey v. White, 8th March, 1842, 4 D., 890.) The laws of England, therefore, are not in this part of the world the most important and interesting. The consuetudinary or unstatutory law of England has perhaps fewer principles in common with that of Scotland than the latter has with the law of any other country in Europe; and this divergence has been the cause of many difficult questions. In these the law of marriage and that of succession have been particularly fertile. In the former the difference between the institutions of the two countries, when subjected to the principles of international law, has been productive of very remarkable effects. In England there are certain acts which must be contracted, by the law of marriage, or lawful marriage. In Scotland the consent of parties to hold each other as man and wife, when sufficiently attested, is, according to the doctrines of the civilians, sufficient. But in England it is a marriage when it is a public, or legal, or declared in the place where it is contracted valid in England; the consequence is, that the law principle of marriage by single attested consent would have probably fallen into desuetude and oblivion in England, if in the law of Scotland it included all marriage, who thus evade the restrictions of their own law. On the subject of succession, a series of decisions in both countries has settled two very important principles—that in the case of landed property, full power of sale, or disposal, must be given to the owner of the place where the property is; while in moveable or personal property it follows the lex domicilii, or law of the domicile in which death occurred leaving it intact.

INTERROGATORIES. [EQUITY, P. C.] INVENTION. [PATENT, P. C. ; COPYRIGHT, P. C. S.] INVENTION AND DISCOVERY. The rights of individuals, as to the honour due to the origin of new views, processes, or methods, are matters of constant discussion in the history of letters and science. It is strange that the subject should never have been generally treated: and in default of better, we may be content to put materials for consideration, which may perhaps help the young reader of the history of science (from which our examples will mostly be drawn) in forming his opinion of the controversy. Invention and discovery are, for our present purpose, synonymous terms. As commonly used, the first signifies the formation of something which would not necessarily have existed before; the second signifies something which has come out that which always did exist, and would have existed whether the discovery had been made or not. We all perfectly see the error in the assertion, set down for correction in the English exercise-books, that 'Galileo discovered the telescope, and Harvey invented the circulation of the blood' and also the propriety of the assignment of words made by Mr. Macaulay, when he says that the terms in which Machiavelli is usually described would seem to import that he was 'the discoverer of ambition and revenge, the original inventor of perjury.' We can imagine the possibility of a telescope having never been framed, or a false oath having never been sworn; but long as they exist, and his blood circulate, feelings of ambition and revenge will spring up in his mind. The words have some analogy with those of problem and theorem in geometry: and particularly in this, that invention can be said to be the discovery of the existence of a new principle, and discovery the discovery of the art of writing. In this manner it may be asserted by some [BACON, ROGER, P. C.] that Roger Bacon discovered the telescope. There must be then some case in which the discovery is lawful, and some law that every discovery leads to invention. But yet there is some cases in which the preceding definitions fail to describe the actual use of words: for example, bichromate of potash was never found in nature, never discovered: its ele-
ments were compounded in the laboratory by its inventor. But this is only to call attention to the fact that there is
nothing but a discovery: we should recommend them to draw
the distinction, as useful to the memory in relation to the
history of their science.

The words discovery and invention are tempting
resemblance, often just, and often fallacious, to those of
theory and practice. But in fact each of the things must be
subdivided into theoretical and practical. The effect of the
non-spherical form of the earth upon the moon's motion was
discovered theoretically: the variation and the ejection were
discovered practically. As to inventions, we call Davy's
safety lamp a theoretical invention: for the question given
was how to overcome a certain inconvenience: generally, it was
not even assumed that a lamp was to be constructed. But
the common story of the boy who saved his labour by tying
a string from the valve he was employed to open and shut
to a part of the machinery which moved in such a manner as
to do it for him, is, if true, a record of a practical invention.

Still there is truth in this, that practical men, properly so
called [Theory and Practice, P. C.], have invented
to a stranger than the things they have discovered; and that theoretical men
have discovered more often than they have invented.

It is no wonder that the early history of discovery should be
coveted and uncertain: the history of documents, which oper-
ates on all our first knowledge of antiquity, is a sufficient ex-
planation. Nor is it surprising that first writers should be
persons of unsettled claims; that in the case of Euclid, for
example, we do not know a single document, no discover-
cies began as where they ended. But it does seem
strange that in matters of our own day, or that immediately
preceding, it should be a question to whom a right of dis-
covering, or even the right to distinguish them, should go.
A look, to the date of the publication of which there is every
possible attestation.

There is one most important preliminary consideration,
which will in the minds of some few be the first time it will
be noticed, and examine the face of the whole question.
When the period arrives at which a discovery becomes possible,
there are many courses which lead to it, and many ships
sail in the same direction; but the one which be-

further. When a new island is discovered in or near a fre-
quent track, as soon as a ship of some one country casts
anchor in a port and takes possession, it may be no
words found in some logs that something like land had been
suggested before, in others that land birds had been seen,
and in others that the colour of the water was noted, in others that
an alteration of the current was observed, and so on, all near
the same point, and any one of which might have led to the dis-
coveries of the hint had been followed. It is the same in matters
of science, to an extent which will not be easily credited by those
who live in the midst of the great centres, and it enhances the merit of
most original researches. It is much to the credit of Newton that Huygens
had gone so far as to determine the conditions of circular motion, that
Grimaldi had been the first to explain the properties of light, and that
Cavaleri had all but discovered the method of fluxions. The character of accidental good fortune disappears when we see
that the progress of knowledge seems to bring new results within the possible reach of many, but within the actual
reach of only one. Is there then nothing accidental in dis-
coveries and inventions? We answer that there is something,
but that the accidents which might produce discovery are
happening to all, and frequently; while the accidents which do
produce it happen to those only who are ready to take advantage
of them. But this it may be said is reasoning in a circle; for if
we had asked how we distinguish the person who is ready to take
advantage of the accidents, from those who have only the dis-
coveries to point to. We reply, that it generally happens that
the persons who can thus fix a causality, are also those who give
evidence of successful research in cases when fortune seems
without special favor. It was by a mere accident that Mr. Baily
[Flamstead, P. C.; Baily, P. C. S.] bought a house oppo-
site to the possession of a large bundle of Flamsteed's letters,
and nothing more than the fact of their existence came to his
ears. Many perhaps had seen them, and either taken it for
granted that the contents were all in print, or been unable to
judge of their value. But the life of Flamstead is not the only
one that has had this history: there was no accident about the editorship of the old
catalogues. It is said to have been by a casual effec-
t of a mist at a window that Malus discovered the polarisation of
reflected light; but then Malus was a profound optical in-
vestigator. It is our conviction that no accidents are
valuable except those which have the probability of right
times; and that there are usually other means of showing this
besides the success of the accidents themselves.

Before we can examine the title to a discovery, it must first be
settled what the discovery is, and the principal point at issue is,
what is the steam-engine. Heron of Alexandria certainly
produced rotatory motion by steam, and, with sufficient funds,
could have ground all the corn in Egypt by his method. If
we assign the merit to the person who contrived such an
economy of fuel as to place the use of steam on something like
its present footing as a commodity, it is then a question
whether any except Watt has the claim. M. Arago remarks
on this subject, that a watchmaker would be struck dumb by
the question, who invented a watch? The thing as it now
exists is not the invention of any one person. As long as
there is any national feeling in the discussion, one or another
definition will be proposed, constructed to suit the advocacy
of one or another claim. We have not here to decide the
cases which we cite; it is enough that they illustrate our

point. It may happen that in a complicated instrument or method,
the perfection of which involves a variety of documents, each
some one distinguishing characteristic the introduction of
which marks the main epoch of the invention. In the case of
the watch, for instance, if we ask for the distinctive definition
of the watchmaker, it will be seen that it is the clock, or the
measuring time, which would include the clock, or an application of wheel-work for that purpose, which would in-
clude the clock; but it is the use of a spring for the regula-
tion of the mechanism should be the question. It is to a
look, to the date of the publication of which there is every
possible attestation.
It is not always, to be sure, that this goes such a length as procuring for Dalton's atomic theory the character of being a reproduction of the notions adopted by Epicurus from his predecessors; if it did there would be the least harm; there are many connections between which misgivings are put in the way and it is easily brought between them. The nomenclature of science is perplexed by phrases of no precision—as that Newton discovered the motion of the heavenly bodies by means of gravitation—that he first advanced the true theory of astronomy, which he did in one sense, and Copernicus in another; whence the provinces of the two are frequently found to overlap; it must also be remembered that a little earlier than this opinion, the result of choice between several, one or other of which must have been taken, is confounded with the same opinion advanced and supported by reasons. Thus Philolaus and Arastarchus asserted the motion of the earth, and Copernicus is said to have only revived their opinion. The difference between the two cases lies in this, that the antient philosophers merely asserted their belief, the modern one made his hypothesis the means of accounting for all the known motions of the heavens, diurnal, annual, and precessional.

The specification, to borrow a term, having been agreed upon, the next question is, what constitutes a claim to discovery? The answer is, priority of publication. To this, as it has often happened, two persons should discover the same thing about the same time, the one who first publishes is universally recognized as the discoverer. Of course, if a fraud can be found to be satisfactorily shown, the first publisher shall recover his matter from another, he would not be allowed the advantage of his wrong: but the onus of proving the fraud lies entirely upon the asserter of it, and, until the evidence and the practice of the law, determine whether there be a reason for the rule. The reasons for this rule are not altogether those which exist for the rule in law. The objects of the latter are the protection of private rights and public peace; or rather the assignment of private rights in such a manner, as best, in the long run, to promote the welfare of the community, and particularly its peace, without any great shock to the natural feelings of equity. It is not difficult to conceive a case in which men would have a small personal advantage, yet be not disposed to natural justice, or what is so called, for the sake of a rule which would prevent them from lying to prevent the assertion of it. But if the object of the scientific historian is truth for its own sake; he has nothing to do with conventions made for the sake of peace.

This rule, that first publication gives the right, until the contrary is proved, is adopted for the sake of its own probability, as a starting point. Select, at hazard, the name of a result, and of its first announcee; no doubt will exist in the mind of any one, used to the history of science, that it is at least fifty to one that the discovery is the first public. But it is the fact that the discovery was made at an earlier period, and that if that fact can be established, the history of the human mind must not be falsified by adherence to a rule. If, for example, it could be shown that Archimedes must have had a geometrical and a differential calculus, which deference to the notions of his time prevented him from publishing, it would never do to let the formal claims of Leibnitz and Newton prevent the allowance of that of Archimedes: for then would result the suppression of the actual fact, which, if true, would be of great consequence, namely, that the Greek mathematicians were powerful enough to lead their best minds to the discoveries of modern times. We insist upon this because we have observed a considerable tendency in writers of history to establish a rule on legal grounds of peace and convenience. There is also a confusion between two distinct things: the claim to the discovery is different from the claim to the publication: the former demands true facts, the latter just appreciation of his merit. By a perversion of the human mind, Newton and Leibnitz would lose fame to-morrow, more or less—that is, more with some and less with others—as if a small number of Archimedes's papers were to turn up, showing that he possessed a formal differential calculus. We are apt to assign praise to mere priority, independently of originality, and to withdraw it on failure of priority. But the priority of publication is not the same fact. If the priority of the idea lies in this, that the earlier an invention or discovery is made the sooner the methods and instruments, and the fewer the hinds to which it is due. For example, D'Alembert reverts to the priority of Tartaglia (Tartaglia, P. C., p. 126) in, or shortly before, 1754. He has all the merit due to the discovery, as n. 1754. But could it be proved now that Taylor's works, &c. were recent forgeries, so that D'Alembert should stand as the original inventor, it would be impossible to put him in Taylor's place: the differential calculus was in two very different states in 1716 and in 1754.

There is also an injurious tendency to stand by the fixed rule as a thing of good consequences, in the way of punishment or stimulus. The first who discovers the item, but right to substitute, in history, the thing which is not for the thing which is, there are advantages arising from the adoption of the right discovery. Tartaglia [Tartaglia, P. C.] suppressed his method for cubic equations from a selfish motive: Cardan, to whom he had communicated it under promise of secrecy, published it, with a sufficient acknowledgment; and in the same breath, whatever may be the case, little to regret here: Tartaglia was willing, simply that he might be able to puzzle his contemporaries, to retard the progress of algebra; it is not certain that he ever would have published his discoveries. The public has rewarded the individual to whom they were indebted for knowledge by exalting his name to the rule he announced. If it were understood that the name attached to any scientific result was always that of the first publisher, saving all the rights of history over the truth of the discovery, this and similar acts of nomenclature might be a satisfactory use of the norma loquenti. It has sometimes happened that individuals have deposited sealed packets with the request that no one should open them until after their death, and before any one else arriving at results which they wished to avoid making public until they had followed them out to their remote conclusions. This practice is one which would not prevent the contents of the packet, if it came independently by the same results, and published them before the packet was opened.

The next question is, what constitutes a sufficient publication. A printed book, pamphlet, magazine, or paper, in which any one who likes may buy, is a record of the court of history from the day of its appearance: but any other mode of communication, which is of its own nature not addressed to the public at all; and it may be doubted whether it can be available. A communication to a scientific body, for example, is only so much better than a letter to a friend, as it is more public and more easily proved; but unless it be published in the transactions of that body, in which case it runs with a book from the date of publication, it will require subsequent establishment. There is, however, always a difficulty with regard to such communications, when the transactions of the academy in question do not appear till some time after the reading of the memoir. It is impossible to know what an author has added as the paper went through the press. He is the best judge of the press. In some cases it is always necessary to assume the date of publication, unless some proof can be given that the memoir as published is, in the matter under dispute, the same as that which was originally intended. It is impossible to imagine that Archimedes or Ptolemy would communicate his work before it was printed. It is too little doubt that, in course of time, bodies which publish transactions will find it necessary to require that authors shall either print their communications as presented, or date such additions as they feed, desirous of making.

The most remarkable question of publication of which everyone was that relative to the invention of fuses, &c. [Fuxionis, P.C.; Commercium Epistolicum, P.C.] There never was a case in which it was more necessary to consider the rights of history, and not to judge by any fixed rule. Newton, unquestionably the first to discover the principle of fuses, &c., was not the first to publish. An anagram, or transposed sentence, cannot be looked upon in any other than as a sealed packet. Leibnitz has accordingly the full merit of an inventor, and the priority of publication is no reason why he could have published it, if he had chosen.

It frequently happens, as before observed, that independent discoveries take place about the same time; then is no doubt that such is the fact. When the publications take place very nearly at the same time, particularly when they are in different countries, it is easy enough to admit the real independence of each. If the same notices of the Royal Society and the Comptes Rendus of the French Institute within a few weeks of each other, the presumption is strong in favour of neither writer having had a communication, directly or indirectly, from the other: and
this presumption must be rebutted by any one who desires to prove the contrary. But this becomes impossible without it. Archimedes was the greatest of the Greek philosophers; but Sicily was the birthplace of the great mathematician. The question, therefore, becomes a question of degree only, so far as it is derived from time only, is weakened. In such a case, the internal evidence of the writings themselves must be carefully looked at. There is probably a clear difference between the discovery made by the different investigators arrive at, and even in which they state, the same conclusions; those who would do a dishonest thing might know this as well as others, and might endeavour to conceal the false origin of their discovery. To detect the falseness of such a fraud is not always easy to prove its baseness is next to impossible. It mostly happens that really independent investigators carry their results to different lengths; one will go further in one part of their research than another. As may be supposed, the most disputed cases are national ones; including in that term the schisms of different classes in the same country, as the scientific feuds of universities, of literary societies, &c. And between people of different countries and governments, the question arises in two distinct ways, not only as to the definition of the discovery itself, and the priority of publication, but as to the country to which the discovery is to be said to belong. And here there seems to us to be a necessity for a distinction which is rarely made, and no wonder; national pride is the mortal enemy of discriminative argument. All people like to believe that their race is gifted by nature in proportion to its talents; and that their public policy is calculated to draw it out. For proof of this they appeal to their great writers and thinkers, among whom they include all whom they have drawn into their country, and all whom they have driven out. Not a man of the eminent men who have been induced to settle in a country not their own, may be a credit to the institutions, but can be none to the race, of their adopted country. Those who are honour to the race but not to the institutions of the land from which they are exiled. Take the cases for instance of Lagrange and De Moivre. Lagrange, who, of many offers made to him when he left Prussia, pre-}

INVESTITURE.

INVOLUTION AND EVOLUTION. In our article under this head, we gave an account, with instances, of the method of solving equations, which is commonly known by the name of the method of AGF. W. G. H., in his Bath. We believe we may usefully give here a consideration extension: first, because the method [Computation, P. C.] is one of the best examples of a constant; secondly, because its meaning nor its theory is very generally understood, and the latter is very instructive. We suppose the reader of this article familiar with the one which preceded it. The process of 

\[(ax+by)z+c=dx-4] \]

Horner's method of doing this, takes the figures from left to right, or takes those of largest value first; and exhibits a plan of performing the operation, which combines the result of each figure with the joint result of all that come before. Thus in finding the value of the preceding when \(x = 123-456\), the value is first found when \(x = 100\); then, by the help of the preceding, \(x = 120\); then, when \(x = 123-4\); and so on. By this means we are enabled to proceed, when the value of the succeeding figures depends upon the one which preceded. The procedure in this case is as follows: a great many figures (about 116) being repeated twice over, in a manner wholly unnecessary in computation, in order to facilitate the explanation.
We first put down the coefficients as usual, not changing the signs, and give them which is only a convenience, and does not alter any figure). The value of \( x \) being 121-23, we begin with 100, which, having two ciphers, we mark off by commas from the several coefficients 0, 2, 4, 6 places. We then proceed by Horner’s process with the figure 1 (not 100), taking care to make commas fall under commas, or to use the commas as if they were decimal points (which they are in fact, though not upright-points). As soon as we have done the figure 1, we note all that comes before the lines \( A \), we learn as follows. Let

\[
\frac{\partial^2}{\partial x^2} = 3 \times 141 \cdot 0 + \text{000} \cdot x - 1427 \cdot 499
\]

then, \( x\), being 100, \( \phi, \phi, \alpha, \beta, \gamma \) and \( \delta \beta \) are severally 8987633-801, 289371-809, 2896-829, and 9. We then write down the results again, after the lines \( A \) (which is not necessary in calculation), merely to show the new disposition of the commas. We are now to proceed with 20 (from the first in 121-23), which, having one cipher, we mark off 1, 2, 3 places in the several columns. Immediately before the lines \( B \) we learn that when \( x = 120, \phi, \phi, \alpha, \beta, \gamma \) and \( \delta \beta \) are severally 15505348-181, 352634-469, and 3269-836. We then write down these results without any commas, and proceed with the second in 121, from which we find that when \( x = 121 \), the functions are 18986535-209, 396456-458, and 3269-836. We then begin to provide for the decimal point, by annexing one, two, and three ciphers to the working columns, and taking the second 2 in 121 to work with, and applying Horner’s process, we find, when \( x = 121-2 \), that \( \frac{\partial^2}{\partial x^2}, \phi, \phi, \alpha, \beta, \gamma \) and \( \delta \beta \) are severally (remembering that all the annexed commas are so many additional decimal places) 15987573-212790, 352634-51690, and 3269-2550. Finally, we annex the ciphers again, and with the 3 we find that \( x = 121-23 \) gives 15987573-760554100, 396049-8904400, and 32900-06800.

Let us now compare the trouble of this process with that of any other method of doing the same. If we throw out all the figures which we have written twice over merely for explanation, and also the last two and one lines in the second and third columns, which are only wanted to go on further with, we have written down about 280 figures. The ordinary verification costs about 340 figures. It is true that every step is both a multiplication and an addition in one; but this can be done and ought to be done in the use of this method, and hence done in the ordinary method. And we have not only the advantage of a purely mechanical method, in which the first arrangement causes the succeeding steps to require nothing except a look at the successive figures of the value, but the still greater advantage of being able, at the end of the process, to make any small alteration of value with ease. If, for instance, having discovered that 121-297 would do better than 121-23, we wish to geographical accuracy, we have but to rub out the last 3-process, and proceed with 9 and 7. In the ordinary mode, we must either repeat the whole process again, or correct approximately by substituting 121-000, which will require us to calculate \( \frac{\partial^2}{\partial x^2} \) and perhaps \( \phi, \phi \).

We will now exhibit a common multiplication, and the formation of a square: not, of course, that we attach any particular value to these simple cases, but that we may show the uniformity of the process. Required 14796 \times 32316, or the value of 14796 \times 0 when \( x = 32316 \). We repeat the lines as before, which is more than is necessary, and makes this process look very long.

\[
14796 \times 0 \times 0 \times 32316\]

Then follow the square of 279-46, or the value of \( x^2 + 0x + 0 \), when \( x = 279-46 \).

\[
1 \times 0 \times 0 \times 0 \times 0 \times 32316
\]

The process here described is one which, we venture to say positively, has neither been put in its right place, nor received its due reward. It is the natural extension of the common process of multiplication, and its inversion is as naturally and necessarily the proper mode of solving equations, as that of multiplication is the same for the simple equation \( ax = b \), or common division. The invention of it must rank, not with the analyst or the algebraist, commonly so called, but with the discoverer of the process of multiplication and division, and the extraction of the square root.

The application of this method to the solution of \( \frac{\partial^2}{\partial x^2} = 0 \) consists in finding the first figure by trial, and making use of the Newtonian approximation to find successive figures; namely, that if \( a \) be nearly a value of \( x \), \( a - \phi \) is more nearly so. This method becomes difficult when two roots are nearly equal; but the difficulty lies in what may be called Newton’s part of the complete method, not in Horner’s part. When the difficulty of algebra shall be conquered, the process of arithmetic may easily be amended in the trial part: but to suppose that a capital improvement in the manner of conducting computations is little worth, because it is not accompanied by a victory over difficulties of quite another kind, is as unreasonable as to quarrel with a calculating-machine because it is not an inventing-machine. This much can be said, that, with a little more trial, Horner’s method may be applied to the case of nearly equal roots; and that, as it is, it is more efficacious in discovering them than any other method.
To what is said in *Evolution and Evolution*, P. C., we may add the following remarks. 1. When the last term is positive, and 2. In the ordinary process be made negative, it is better, instead of changing the sign of the last coefficient only, to change the sign of all but the last. Thus in solving $a^n - 12a^{n-1} + 1 = 0$, the roots of the column should be $-1$, 0, 1, and 1. 2. Also that at any period of the process the divisor and dividend columns should become negative, the signs of all should be immediately inverted.

2. In the construction, it will be advisable to make the figure which comes next after the separating line correct, to continue it, in fact, till the next construction, and to use it to carry from. This has not been done in our main article (P. C.), but it is done in the instance of *Computation*, P. C. S. In that instance, the following figures, seen one over the other in the last column but one, as follows 3, 5, 7 — 6, 9, 1, — 2, 3, 2, are figures cut off by the construction, but made up from the second column to carry from the fourth.

3. If, at the beginning of the process, all the heads of the columns be multiplied by 9, the root will not be altered, and, until the construction begins, the verification by casting out nines is rendered easy, since every result in every column is divisible by 9.

We shall now show how the process works in some equations which have equal, and nearly equal, roots.

Let $x^2 - 62x + 9 = 0$, which has two roots, each equal to $\sqrt{5}$.  
-1 0 6 0 9 (1:7320)
-1 5 5 40000
-2 3 8000 1210000
-3 0 5697 5041
-4 39427 740000
-47 707 401563
-54 112409 49329
-61 115449 25190
-680 117507 1290
-683 118974
-686 11971
-689 11885

The existence of equal roots, or of nearly equal roots, might be here suspected from the slow increase of the divisor column; but the method could not verify the fact of their being two absolutely equal roots. The column preceding the divisor column being large and negative, requires us to make trial of figures above, not below, those which the divisor column seems to indicate. But nearly equal roots may sometimes be detected, as in the following instance. Let $x^3 - 10x^2 + 14x - 30 = 0$, of which it is known that one root lies between 1 and 2. The ordinary process gives

$$-7 -90 -760 -2400$$

This root may be carried on without difficulty. But at the end of the second process, when the dividend is reduced to 8000, the divisor only 8400, and the preceding column as much as $-1904$, it may be worth while to try another figure. This state of things gives a suspicion that there is another root in the immediate vicinity of the one in hand. If the three last columns be $a$, $b$, and $c$, and if we find that $pa-bc$ is nearly $c-p$, which is the trial test of $p$ being a new figure of the root, we are sure that $(p+1)$ $a+b$ will not be near $c+p+1$; and moreover $p(a+bc)+c$ has not two positive roots. But if the three last columns be $-a$, $b$, and $c$, it may very easily happen that $b+pa$ may be nearly $c-p$, and $b+pa+bc$ nearly $c-q$; for $(b-pa-c)$ has two positive roots. Perfect certainty, in the absence of an easy algebraical criterion, may be only attainable by trying every figure. In the instance before us, finding 1-41 succeed, with a presumption of a larger root, we try 1-45, beginning with

$$-7 -1940 -9400 -8000$$

This figure will not do, for a permanent difference of sign is established between the dividend and divisor columns. We then try 2, as follows:

$$-7 -1940 -4492 -984$$
$$-1954 4492 984$$
$$-1944 556$$
$$-1948$$

There is now a difference of sign between the two last columns, but, looking at the second column, we see that agreement may be restored by the next figure. The figure 8 will do it, as follows:

$$-7 -1980 -55000 -984000$$
$$-19866 -103408 -157636$$
$$-19923 -262864 -399619$$
$$-19989 -522999$$

But now 22920000 is contained more than 10 times in 399619000, which shows that 7 is not high enough. If we try 9, we have

$$-7 -1980 -55600 -984000$$
$$-19866 -135947 -214323$$

and a permanent difference of sign is established between the two last columns, whence 9 is too high. Proceed then with

$$x^9 199880 262864000 157636000$$

and we find $14325714257...$ for a root. The reader may watch the operation in the following equation:

$$2430^4 - 86467^4 + 102834^2 - 4070^2$$

the roots of which are $1-1111... 1-222...$ and $1-238...$

Whatever common figures two roots of $p^2 = 0$ may have begun with, there must be a root of $p^2 = 0$ which begins with these figures. And whatever common figures three roots may begin with, there must be two roots of $p^2 = 0$, and one root of $p^2 = 0$ which begin with those figures: and so on. If there were a difficult equation having three roots nearly equal, no method of detecting them would be easier, of all those known at present, than solving contemporaneously the three equations $p^2 = 0$, $p^2 = 0$, $p^2 = 0$, not making any step in one till all had been brought up; that is, one step of each first, then the second of each, and so on.

It may happen that a finite root is established, and yet that the process must be continued to obtain another root beginning with the same figures. For example,

$$x^3 - 46x^2 + 75x - 38 = 0$$

It will be seen in the following process that 2 is a root, with a presumption, from the appearance of the divisor column and the one before it, that there is another root beginning with 2. And by trial 2-1111... is found to succeed.

$$9 - 46 75 38 2-1111$$
$$-9 - 1221$$
$$89 8700 22$$
$$98 9779 19$$
$$1070 10867 1$$
$$1079 10977$$
$$1088 11087$$
$$1097$$

We shall now proceed to a more account of the history of this problem, and of the controversies which have existed, and to some extent still exist. For a fuller account of it up to the time of Mr. Horner, see an article in the 'Companion to the Almanac' for 1839. Before the time of Vieta, evolution consisted in the rules for the performance of division, and extraction of the square and cube roots, in forms probably derived from the East. To him [Visca, P. C., p. 315] we owe the first publication of a numerical method of finding the successive figures of the root of an algebraical equation by means of the value of the function equated to zero in the equation. This method of Vieta is in fact that which Horner's process now makes so easily practicable. If $f(x)$ be the equation, and $a$ a part of the root, it uses $f(a)$, and $f(a+1) - f(a)$ as a divisor. The process is so cumbersome, that Vieta does not attempt to apply it to equations having more than two figures in the root.

This method attracted but little attention on the continent:
but in England, where everything relating to numerical calculation has been always diligently studied, it was much noticed, and received extensions of power. In the posthumous work (1631) of Harriot (Harriot, P. C.) examples of it are given where the method had been given for reducing the labour of the ordinary extraction of the cubic root: we may mention one, which is ingenious and effective, and almost exactly a particular case of Horner's method, given by Mr. A. Ingram, in his edition of Malusio's Arithmetic, 1715, p. 560. And Mr. Horner himself refers to an edition of Melrose's Arithmetic, by Mr. Ingram (the same, we suppose) as containing such a method.

Mr. Horner's paper was read to the Royal Society on the 1st of July, 1819, and was published in the current volume of the Transactions, on the 1st of December. These dates are of importance: the publication of the above paper was the signal for more than one person to make a nibbling claim to the invention. Mr. Horner was unfortunate in two points. First, he had not sufficient knowledge of analytical algebra to be aware that his method contained the process of Vieta, and that his real claim consisted in the discovery of the beautiful process by which the labour is immensely reduced, and completely systematized. Secondly, he appears to desire to be the analyst rather than the arithmetician, and will not show anything except to those who can take all. It is true, beyond a doubt, that his method is adapted to every sort of equation, and that it is as great a help to the person who desires to solve \( x - ax = 0 \), or \( ax = x \), as to the other who wants nothing but a common algebraic equation. So far, then, it is more than Vieta's method simplified, it is the same as the method that the inventor had proceeded from simple algebra to the more complicated cases, his merit would have been more rapidly appreciated. He did not well see that his mode of solution applies as well to the integer part of the root as to the fractional; nor did he fully comprehend how much of his own discovery consisted in the general mode of calculating the value of \( x \), as given at the beginning of this article. But that we may not do him injustice, and still more that we may enable those of our readers who have not access to the original paper to see how completely he had got hold even of the most convenient analytical process, we give the solution of the famous Newtonian instance \( x^2 - 2x = 5 \). After reducing the root by 2, the heads of his columns are 1, 6, 10, and 1 (the first column, which is always vacant, he does not set down.) He then annexes either dots or cipher, and proceeds exactly as follows:

As soon as Mr. Horner's paper had been published six months appeared "A New Method of Solving Equations," by Theophilus Hildred, London, 1819, (preface dated June 1,) 4to. The method is taken from Harriot; and a supplement is added, which gives Horner's method. Both are claimed as independent inventions, and Horner's name is not mentioned. Mr. Hildred asserts that, after having had a method for forty years, he was led to that in the supplement by a mistake he committed in solving an equation sent him by one of his subscribers. We have given, in the article of the 'Companion to the Almanac,' already cited, our reasons for coming

---

* We cannot but believe that Mr. Holdred did see Mr. Horner's paper. Had he mentioned what the name of the book was, or what the book was made, &c. &c. distinctly declaring when and where he first saw Horner's paper, he might have possibly established a claim to a second inventor.
the process of diminishing the last root by one, as on the right.

Accordingly Budan has both (A) and (C) to do, where Horner has only (B). To diminish a root by 3, Budan has three processes, and so on. To diminish a root by 10, 20, &c., he divides the roots by 1, 2, 3, 4, &c., and then multiplies the resulting roots by 10; and similarly for 100, &c. It is obviously possible, by a large amount of calculation, to retain the root of an equation in this manner; but Budan is not only obliged to call in other methods, and even thus to spend very great labour, but he ends by presenting the root in the form of a sum of common fractions, each of which must be reduced to a decimal. Thus for $x^2 - 2x = 5$, he gets

$$x = 2 + \frac{1}{1 + \frac{1}{275 + \frac{1}{165922}}} = 2.004551481364$$

Budan's method is not then even of the same species as Horner's. In an appendix added to the edition of 1822, two years after Horner's paper, there is the method extended to the process for diminishing the root by $n$ (Horner's process), but no use is made of it, and singularly enough the only example given is one in which $n = 1$.

Mr. Horner ('Leybourne's Repository', page 38, of part ii., vol. v.) denies ever having seen Budan's work until 1818, after his method was finished. This, one point of view, counts for nothing; for every discoverer has a right to have it supposed that those who come after him have used his works: that is to say, he would have a right to the credit therefore arising, even though it could be shown that subsequent discoveries were made without his aid. If a partial or unfinished method turn out to have a value of quite a new character when made complete, it is impossible to deny to its author the credit of having been further than his contemporaries on the road towards the complete method; consequently Budan must have, in one sense, the merit of having prepared the particular case of which Horner afterwards made use. But, as it happens, a contemporary of Mr. Horner, in trying to insinuate that he had taken his method from Budan, has furnished independent evidence to the contrary. Mr. Nicholson, in a note to the preface (page ix.) of his essay 'On Involution and Evolution' states: 'I am informed by Mr. Dickson that about twelve months ago he (Horner) purchased at his shop, in St. Martin's-le-Grand, an 'Essay on the Numerical Solution of Equations' by Budan; at the time he mentioned that he was engaged expressly on this subject.' This called forth the preceding statement from Mr. Horner, who, had he had any unfair intention, and had he really been indebted to Budan, would have been careful not to reveal the date of Mr. Nicholson's preface in which he must have bought Budan only just time enough to insert the note about him in his paper before he sent it to the Royal Society. Instead of this, he answers in the most straightforward manner, that he bought Budan about July, 1818, nearly two years before Mr. Nicholson wrote; but avers that his method was then finished. And this we entirely believe; and also that it would have been impossible for him, fully engaged as he was in teaching a school, to have produced his method, so as to send it to the Royal Society in the spring of 1819, if he had only seen the first hint in the summer of 1818. But had he seen Budan's work, and had he then conceived the hint with which he improved, his merit would not have been the less: Lagrange, the greatest writer on equations then existing, had seen it; Legendre had seen it; and both had closely examined it, and reported to the Institute upon it. The members of the Institute had seen it. Lagrange, too, knew of Vieta's Exegesis. But no one,

---

* The preface is dated May 17, 1819, and the publication took place early in July. Mr. Horner’s paper having been publicly read at the Royal Society on the first of that month.

P. C. S., No. 99.
except the Bath schoolmaster, ever brought forward Budan's method, or of a method, either from Budan, or independently, to the improvement of Vieta. Fourier had seen Budan's book, and had invented a method of his own of solving equations; or rather had given his own mode of conducting the same approximation; but this method is far below that of Horner.

We have written so much on the discovery of this method, because unfair attempts were made by claimants who had no title to any discoveries of the author, who was certainly a genius, of his rights over his own discovery. We refer to M. M. Hildred and Nicholson: though we do not believe the second was knowingly unfair. Mr. Atkinson, when he first saw the "memorandum" of the Oxford society (as some called it), saw and said that it was a capital improvement. We have written also because it can hardly yet be said that mathematicians are alive to the value of this grand completion of the system of arithmetic. The continental writers show no knowledge of it; the Oxford and Cambridge elementary works do not yet recognize its existence. The fact is, that mathematicians dislike calculation, and are apt to form hasty opinions on numerical methods before they have given them sufficient trial. The first elementary writer who brought Horner's method into instruction was Mr. (now Professor) Young, in his 'First Lessons of Algebra,' published in 1804.

In 1891, eleven years after this method was published, appeared Fourier's posthumous work on equations, containing an extended use of Newton's method. It amounts to employing \(g(x)\), \(g'(x)\), \(g''(x)\), &c., to calculate \(g \left( a + h \right)\), \(g \left( a + 2h \right)\), \(g \left( a + 3h \right)\), &c., and calculates \(g \left( a - h \right)\); and a previous calculation of \(g \left( a + h \right)\) gives assistance to that of \(g \left( a - h \right)\).

The equation \(x^2 - 2x - 5\), which Wallis happened to take as his instance of Newton's method, has always been the example on which numerical solvers have shown their power. No one can be said to have carried a method beyond those which preceded, unless he has solved this equation to more places than they have done. Fourier went to thirty-two decimal places, which we do not know that any one had done before. Some students of University College, London, and of King's College, London, and the eldest son of William Inwood, was born May 22, 1794. He was brought up by his father to his own professions. He was several years in Greece, and examined with great care the architectural remains of Athens and elsewhere, and made plans and drawings of them. He assisted his father in most of his architectural pursuits, especially in designing and constructing St. Pancras Church, and had not suffered so much as he did for many years of ill health, would have come to great eminence as an architect. His death is supposed to have occurred March 20, 1843, about which time a ship in which he had sailed for Spain was wrecked, and all on board perished.

Henry Inwood published in 1827 'The Erection at Athens, Fragments of Athenian Architecture,' &c., illustrated with Thirty-nine Plates.' The work, which consists of 163 pages exclusive of the plates (engraved by Nicholson), is printed on elephant paper of very large size, and was published by subscription. He had also commenced a work entitled 'On the Resources of Design in the Architecture of Greece,' which was never completed, and was about to publish 'The Architecture of the Architects of those Countries from Nature,' 4to. London, 1834, with explanatory engravings. Two parts were published, one to ill health, and the work was never completed. He collected many fossils and remains of antient art, most of which are now in the British Museum.

CHARLES FREDERICK INWOOD, second son of William Inwood, born November 28, 1796, besides assisting his father in his works, was the architect of the church of All Souls at Great Marlow, in Buckinghamshire, which was completed in 1835. He also built the St. Pancras National School, in Southampton Street, Euston Square, a large plain brick building of little architectural pretension. He died in May, 1840, aged forty-two. St. Pancras Church, New Road, London, which was the joint work of William Inwood and his son Henry, is in its kind and in its peculiar beauty unique among the churches of the metropolis. The building was commenced July 1, 1819, and completed May 7, 1822; and cost 76,760l. The exterior of the body of the church is, with certain necessary deviations, an imitation of the Ionic temple called the Erechtheum on the Acropolis at Athens (Eræctereion, P. C.), which tower is the acropolis, and the lower part of the Tower of the Winds, also at Athens, which is properly the Horologium, or water-clock, of Andronicus Cyzicetus. The measurements and drawings of these towers were those of Henry and Charles Inwood, as the peripatus of its south entrance requires attention to his request when he says, speaking of the antagonistic claims which had started up—"All I ask of them [mathematicians] in recompense for the facilities consigned to their use is a non-figured method, in toto near in mind that I alone am the author of it." And we have no right, whatever, and are willing to stake our credit upon it, that the inferences of the higher mathematicians in matters of computation is overcome, and when the mode of solving equations has attained the same schoolboys as the name of Horner will be one of the household words of pure arithmetic, and himself looked upon as one of the greatest of its modern benefactors. Justice requires that his name should remain attached to the process, as he so man of the mathematical science, as the name of Henry.
buildings which project from each side of the east end, forming the entrances to the catacombs of the church, are adaptations from the south porch of the Pandrosion. The caryatid figures, of which there were six, four in front and one at each side, were in the place of columns, and supported the principal cornice of the north portico of the building. There is one of the original caryatid figures in the Elgin Room of the British Museum. The sarcophagus beneath each caryatid was its purpose for which the projecting buildings had been constructed. The two Ionic half columns engaged in the walls on both sides of the west end are additions made to form an apparent basis for the caryatids. The entrance near the rear of the church connects with the front of the doors. Grecian temples had no windows; large temples had a central portion of the roof open to the sky; small temples generally received light only from the door, which was wide and lofty. The octagonal tower, with its two ranges of eight columns each, in its form and general effect, combines well with the building and portico, and is in itself an object of peculiar beauty. In the interior the galleries are supported by very elegant slender columns. The ceiling is flat, and formed into a number of ornamented panels. The general effect of the interior is good, though rather deficient in light, especially below the galleries, from the height of the north porch.

The Westminster Hospital, near the west end of Westminster Abbey, was built by William Inwood in conjunction with his son Charles. It was begun in 1822, completed in 1826, and opened in 1827. The material is grey Sullivick brick, with stone facings. It is quite plain except the front and the truncated angles which connect the front with the two ends. The front extends across the road, the height of the building is one story plus a attic, which projects slightly and is a story higher than the two wings. The entrance is by a flight of stairs beneath a large stone porch constructed in three divisions with flat pointed arches. The ground floor and the first floor are the same, with four windows on each side. Above the porch is an oriel window which extends to the height of the two upper stories; and at each of the truncated angles is an oriel window similar to the one over the porch. The flat windows are deeply indented, and are divided into four equal compartments by a mullion and transom, but the two upper compartments are distinguished from the two lower by trefoil tracery at the tops, and each window is surmounted by a weather-moulding. There are in all 200 windows. The brick harmonizes well with the stone portico and dressings, and the general appearance of the front is very handsome. Perhaps the battlemented parapet may be objected to as inappropriate to the purposes of the building, and as less handsome than a parapet of open work would have been, similar, for instance, to that of Westminster Abbey in the north transept, etc. But the parapet occupies the place of the old basement. The interior arrangements and ventilation are excellent. There are 19 wards and about 250 beds.

The dome, which was built, the Regent Square Chapel, opened in 1826; the Camden Town Chapel, opened in 1824; and Somers Chapel, in Seymour Street, opened in 1826, all of which are chapels of ease to St. Pancras Church. He also built numerous other structures, mansions, villas, barns, warehouses, &c.

(Written Communication; Companion to the Almanac; Knight's London; Elgin Marbles, in Library of Entertaining Knowledge.)

IOWA, a territory of the United States of North America, is bounded on the west by the Missouri river and the White Rock river; on the east, by the Mississippi and Des Moines rivers; on the south, from sources of the Mississippi to the Lake of the Woods; on the north, by the parallel of 49° N. lat., which separates it from the British possessions; on the south, by the parallel of 40° 30' N. lat., which separates it from the State of Missouri. The area has been estimated at 200,000 square miles, which is nearly four times the area of England, exclusive of Wales.

Of the northern part of the territory a very large portion is occupied by a vast extent of high ground, called the Coteau des Prairies, which commences about 48° N. lat., and terminates about 43° N. lat., extending in width more than fifty miles, and in length more than two hundred miles, of which, it is said to rise more than 1000 feet above the surrounding country, has generally a rounded surface, with few irregularities, and is for the most part destitute of trees. East of the Coteau des Prairies is an extensive valley, in which the Red River runs northward to Lake Winnipesaukee, and the St. Peter's River south-east and then north-east to the Mississippi. West of Coteau des Prairies is a broad valley of prairie land traversed by the James River, and this valley is separated from the Missouri by a high range of ground similar to the Coteau des Prairies. The area of these two north-valleys has been estimated to be more than 1000 feet above the level of the sea. The rest of the country between the Missouri and the Mississippi contains no mountains nor even hills of large size, but consists of rounded slopes with broad valleys in which rivers flow, the upland tracts being connected with the valleys by gentle slopes. Belts of forest are found near the rivers, and large prairies amid the woods and prairies of the territory. The Coteau des Prairies and the Missouri, but the rest of the country either consists of prairies or is covered with brushwood. The south-east part of the territory, which is only part of which the settlers are numerous, and where the lands have been sold by the federal government, is generally undulating, interspersed with timber-lands and prairies, and abounding in springs and streams. This tract, which is very fertile, extends from the Des Moines River south to the Turkey River north, and westward from the Mississippi fifty or sixty miles to the Indian boundary.

In Iowa there are numerous rivers, which rising in the elevated grounds on the north-eastern part of the territory, respectively eastward into the Mississippi, westward and southward into the Missouri, and northward into the British possessions. Those which flow into the Missouri are comparatively small, the Des Moines River, the Big Stone, the Maquoketa, and the Turkey River. The Des Moines River flows in a south-westerly direction, upwards of 400 miles, and falls into the Missouri where that river flows to the east some distance below Grand Detour. Of the rivers which fall into the Mississippi, one of the largest is the Big Stone Lake, which has its source in the Blue Earth, and one of the largest is the Cedar River, the Wabashipenee River, the Great Macquodie River, the Turkey River, and the Upper Iowa, are also rivers of large size. Of the rivers which flow northward the Red River is the largest; it rises in the same valley as the St. Peter's River, in Lake Travers, which is near the Big-Stone Lake, and has a course of from 300 to 400 miles northward before it enters the British possessions, through which it flows to Lake Winnipesaukee. In the most northern and north-eastern part of the territory, though the elevation above the sea is not much less than 1000 feet, the country is much lower, and the lakes are larger and the islets more numerous, the lakes. There is a lead-mine district in the south-eastern part of the territory, and considerable quantities of the metal are obtained. There are no towns yet of sufficient size to require description; the largest are Burlington, Bloomingg, Iowa city, Davenport, and Fort Madison. There is a newspaper published at Burlington. Iowa, the capital, is in 41° 28' N. lat. and 93° 49' W. long. from Washington.

Iowa was constituted a territory by an Act of Congress, dated June, 1838, and the government commenced July 4, 1838. It was then divided into sixteen counties, and the population, according to the census, was 22,859; in 1840 the population was 43,112; in 1844, it had become 81,929, a rapidity of increase probably exceeding that of any other state or territory in the Union. The legislative power is vested in a governor, a council of 13 members elected for two years, and a house of representatives consisting of 26 members elected annually. The governor's salary is 2,000 dollars a year, and he is a secretary who receives 1,200 dollars a year. The members have three dollars a day, and three dollars for every twenty miles of travelling. There are three judges, who are appointed for four years, and who each receive 1,500 dollars a year. The territory is divided into three judicial districts, in each of which the judges perform circuit duties; the supreme court, composed of all the judges, meets annually in July at Iowa City. Congress voted 50,000 dollars for the building, and 20,000 dollars at the seat of government, for which Burlington was first chosen, but it has been since fixed at Iowa City, where the legislative assembly meets annually on the 1st of December. Congress voted also 5000 dollars towards the purchase of a
terrestrial library. The territory sends one member to the House of Representatives.

On the 5th of April, 1844, the people of Iowa passed a vote, by a majority of 2,400, for forming the Territory into a State, which they were entitled to do when the population reached 12,000. A convention met in Council Bluffs, formed a state constitution, afterwards submitted it to Congress, and claimed to be admitted into the Union as a State. A law was passed by Congress for that purpose, March 5, 1845, which fixed the boundaries of the State thus:—From a point on the Des Moines River to a parallel of latitude passing through the mouth of the Munkato, or Blue-Earth River; thence west along this parallel of latitude to where it is intersected by a meridian running in a north and south direction, 82° W. from Washington; thence due east along the northern boundary-line of the State of Missouri; thence east along that boundary to where it intersects the Des Moines River. The Blue-Earth River falls into the St. Peter's River near the point where the St. Peter's changes its course from south-west to north-east. The boundaries fixed by Congress not only very greatly reduced the size of the Territory, as was expected, but differed so materially from the boundaries proposed by the convention, that the people of Iowa refused to be formed into a State on the conditions laid down in the Act of Congress, and Iowa therefore remains still a Territory.

The quantity of public lands sold in Iowa from 1838 to 1844 (but including only the two first quarters of the latter year) was 1,402,624 acres, which produced to the public treasury of St. 1,920,420 dollars, which is rather more than a dollar and a quarter per acre. There are still a great many squatters.

The inhabitants of the Territory of Florida had applied for admission to the Union as a State, in January, 1830, but the application was not granted till March 3, 1845, when it was constituted a State by the same Act which would have admitted Iowa. Florida made no objection to the terms of admission, and is therefore now one of the United States of North America. A sketch of the new constitution of Florida and other particulars is given under UNITED STATES OF NORTH AMERICA, P. C. S.

I. versicolor, Blue Flag, has sword-shaped striated leaves sheathing at the base, a stem two or three feet high, round on each side, the other, and the six flowers. This plant is a native of swamps and wet meadows in the United States. The rootstock has a nauseous acrid taste. It acts as a cathartic, and its action is attended with great depression of the nervous system and prostration of strength. It also acts upon the kidneys, and is useful in cases where diuretics are indicated.

I. pseudacorus, Yellow Flag, has sword-shaped leaves; the stem round; perianth divided into its inner segments narrow and shorter than the stigmas. It is a native of wet places in Great Britain, France, Germany, and most countries of Europe. The rootstock is acrid and possesses an emetic and cathartic action. The roots when roasted are said to form a good substitute for coffee.

I. Florentina, Florentine Iris, has broad and somewhat falcate leaves shorter than the stem, the petals two inches long, broad at the base and rather pointed towards the base. The dried rootstock is known in the shops under the name of orris-root. The plant is a native of the southern parts of Europe and the islands of the Mediterranean. The rhizomes have a slightly acid and subacid taste, and is employed as a demulcent. It enters into the composition of Ruspini's tincture and tooth-powder, and other medicaments. It was a time used as an ingredient and admixed into the British Pharmacopoeia. The fresh rootstock acts as a purgative, and was also employed as an expectorant in disease of the chest. When dried and turned into small balls it is used for issue-pegs. According to Sub- thorp, this plant is found in Greece, and is also an emetic. It is the Iphe of Hippocrates (Morg. Mal., 2, 673) and the Ipsi ( Dioscorides (Hist. Plant., 7, 12). I. jactilis, Stinking Flag, has sword-shaped leaves, the stem round and distinctly heart-shaped, its inner segments about as long as the stigmas. This plant is a native of Great Britain and other parts of Europe. It has a peculiar smell, which some have compared to roast beef, which is used to wash others in the same manner. Aloe is the Lapis of Theophrastus (Hist. Plant., 9, 8) and the Esopus of Dioscorides (4, 12). I. rubra is the sword-leaved species, the segments of the perianth usually furnished with a purplish or red border, and never with a hollow in the middle of the auricle. The leaves are always green in the field. All these species are cultivated in gardens on account of handsome showy flowers.

IRISH MOSS. [Cladonia, P. C. S.]

IRON BOATS AND SHIPS. [Ship-Building, P. C. P., p. 305.]

IRRADIATION denotes, properly, the emission of rays from a luminous body, the rays being made use to signify an apparent enlargement of the disc of a celestial body; this being caused either by a deviation of the rays of light from a rectilinear direction, or by some illusion arising from the action of light on the eye.

When rays of light from points at the surface of an object fall on the retina, there may be produced on the latter an agitation extending within short distances about the points to which they are directed; the plexuses are made use to convey by the humours of the eye: hence there may arise a perception of a fringe or border about a luminous body, and consequently an apparent enlargement of such body. Thus the image of a star, when seen by the eye, appears to be a disc of sensible magnitude, instead of a mere point; which, on account of its remoteness, would be the case if the rays of each pencil produced no effect beyond their mathematical point of convergence; the disc of the sun or of the moon is conceived to be, in like manner, apparently enlarged; and thus, also, the part of the moon which, when the latter is nearly new, is enlightened by the sun, appears to be a portion of a sphere of greater diameter, than it really is, which is more faintly enlightened by the rays reflected from the earth.

A species of irradiation is caused by the blending together, upon the retina, of the circles of light produced by the pencils which fall on the point, and which are thus converted into a round spot; the humours of the eye not permitting that convergence to take place exactly on the membrane.

ENLARGEMENT OF OBJECTS, P. C. S.

Before the invention of telescopes, the apparent magnitudes of celestial bodies were very erroneously estimated; thus, Tycho Brahe made the diameter of Venus twelve times, and Kepler made it seven times as great as it is now known to be. Telescopes do not entirely remove the cause of such error, but, by diminishing the apparent brightness of the bodies, the error in the estimation of their apparent magnitudes is proportionally diminished. De Sèjour, Lecell, and other astronomers, on the contrary, have calculated the diameters of the sun and moon in eclipses of the former, and have, in order to produce an agreement between them, found it necessary to diminish the apparent magnitudes of the sun and moon by 4° 13' each; on the other hand, it is supposed, of the effects of irradiation.

It is a consequence of irradiation, that objects which are in reality of such apparent magnitudes as are according to their colour or to the quantity of light which falls upon them. Sir William Herschel remarked (Phil. Trans., 1783) that when a bright circle was viewed together with a dark one, the light brightened the dark circle, and appeared smaller than the other; and, in order to correct the erroneous estimate of the magnitudes of the objects seen through telescopes when they are seen against a bright ground, it appears
that the antenates made the thickness of the columns to increase proportionally to the distance between them. The reason assigned for this practice by Vitruvius (De Architectura, lib. 3, cap. 2) is that the columns with wide intervals, being more exposed to the wind, are less subject on that account to be more slender: it must be observed, however, that the perceptions of magnitude depend partly on those of distance; and a contrary effect frequently takes place with objects viewed against the sky when conceived to be more remote than they really are.

ISATIS. (Weal. P. C.)

ISCHYODUS, a genus of fossil fishes included in Chimeran Asiatische.

ISNARDIA, a genus of plants named by Linnaeus in memory of M. Antoine Dante Isnard, member of the Academy of Sciences. It belongs to the natural order Oenogaraphe, and has 4-9-10 calyx, 4 petals, 8 stamens, and a filiform style, with a clavate or cruciform stigma. There is one British species of this genus. I. palastris has a procumbent rooting glabrous stem, opposite ovate acute leaves, terminating in a petiole about 5 cm. long, with minute, sessile, yellow fruits, and a white, 8 mm. petal.

It is found in pools and marshes in Europe, Siberia, and Persia, and in Sussex in England.

I. alternifolia has an erect branched stem, alternate leaves, rather scabrous on the margins, and hoary beneath. It is a native of Virginia and Carolina, in marshy places, and has oval yellow petals. The root is used as an emetic, and is called "Dronkheem." None of the species of this genus possess qualities which entitle them to cultivation except in botanic gardens. They may, however, be reared in a hot-bed, and then planted in an open bed or borders. (Don, Gardener's Dictionary; Babington, British Flora.)

ISOCROMATIC LINES are those coloured rings which appear when a pencil of polarized light is transmitted along the axis of a crystal, as mica or nitre, and is received in the eye after passing through a plate of tourmaline. If a plate of nitre having its surfaces perpendicular to the axis of the nature, is placed between two plates of tourmaline having their axes at right angles to one another, and a lens of short focus be placed so as to transmit the light of the sky through the plates to the eye of the observer, that focus falling a little below the surface of the nitre, the rays of light will be polarized by passing through the first plate of tourmaline, and there will be seen a series of oval rings, each of which is formed from a figure which may be considered as resembling lemniscates. By the nature of the lemniscate, the rectangle contained by two lines drawn from the poles to any point in the curve is constant. The explanation of the circumstance that the tint of any one is represented by the equivalent of such rectangle for that curve: when the light is viewed through plates of nitre of different thicknesses, the tint varies.

The curves are conceived to exist on the surface of a sphere of which a point in the crystal is the centre; and when the optical axes of the crystal are at a considerable distance from one another it is possible, projecting on one plane, the tint in each curve will depend on the product of the sines of the angles subtended by two lines drawn from the poles to a point in its periphery, and also upon the length of the path described by a ray of light passing through them.

ISOCRINITES, a genus of Crinoidea (Goldfuss).

ISOSTES (from I so, equal, and I stes, year), a cryptogamic genus of plants, belonging to the natural order Lycopodiaceae. The capsule of a plant does not open, and the fructification is enclosed within the swollen base of the leaves; it has spores of two kinds, which are attached to filiform receptacles. The organs of fructification in this plant are small cases, which are situated in the angles formed by the union of the leaves and the contracted stem; those seated in the axil of the outer or inferior leaves are divided into three cavities, containing about fifty spherical bodies (granales); the cases in the axil of the inner or superior leaves are divided by numerous transverse partitions into many cavities, all of which are filled with an impalpably fine powder, in the early stages of its development, and gradually becoming black.

The species of Isostes grow at the bottoms of ponds and lakes, and are said to afford excellent food for fish. They are called Quillworts from the rush or quill-like appearance of the leaves.

I. lacustris, Quillwort, has subulate roundish-quadrangular leaves with four longitudinal jointed tubes. The rhizome of this plant is a blunt tuber; the leaves are slender, broad and flat at the base, but elsewhere cylindrical and quadrangular. It is found in Great Britain, at the bottom of lakes and pools. I. Lycopodioides, a plant of the same family, resembles this species, with, however, a much more expanded stem and leaves. The identity of the plant, and other species of the genus, is only imperfectly understood. It is on this account referred to Marigilliaceae by some authors, and made to form an independent order. Others follow the author of Lycopodiaceae, and other plants, 'I follow De Candolle and Brongniart, in referring it here. Delile has published an account of the germination of Isostes lacustris, from which it appears that its spores sprout upwards and downwards, forming an intermediate solid body, which ultimately becomes the stem or cormus, but it is not stated whether the points from which the ascending and descending axes take their rise are uniform; as no analogy in structure is discoverable between these spores and seeds, it is probable that they are not. Delile points out the great affinity that exists between Isostes and Lycopodium, particularly in the relative position of the flowers of the two kinds of reproductive matter. 'In Lycopodium,' he says, 'the vegetative shoots occupy the upper ends of the shoots and the granular thecae the lower parts; while in Isostes the former are found in the centre and the latter at the circumference. If this comparison is good, it will afford some evidence of the identity of nature of those thecae, and that the pulverulent ones are at least not anthers, as has been supposed; for in Isostes the pulverulent individuals of the male have the same external appearance, the presence of what has been called its stigma, as the outer granular ones; so that if Isostes has sexes, it will offer the singular fact of its anther having a stigma.' (Babbage, British Flora; Heywood, History of British Ferns; Lindley, Natural System; Burnett, Outlines of Botany.)

ISOTELUS, a genus of fossil crustacea (Thysicera) from the Silurian strata, especially of North America.

ISSUE PEAS are round bodies employed for the purpose of maintaining irritation in a wound of the skin which is called an issue. (See P. C.) It is a matter of indifference of what substance they are made, as long as they do not introduce poisonous matters into the wound. The seed of the common garden pea is frequently used. It is however more common to use the young unripe fruits of the common orange (Citrus aurantium). The fruits are dried and afterwards turned in a lath before they are used as issue pease. The unripe oranges, dried, are sold under the name of orangeetas or Curcum orangeas. The rootstock of the iris Filumens is also flooded into peas and used for keeping up the discharge from issues.

Lindley, Flora Medica; Christian, Dispensatory.

IULUS, a genus of fossil scaphopoda (Triphora) from the Miocene strata, as now form the order Chilognatha (χιλόναθος), the first division of Myriopoda in the arrangements of Leach and Latreille. The Chilognatha have crustaceous and usually transparent bodies, of the form of a leaf, or a book. The valves are very short feet, each terminating in a single book; a vertical rounded head, furnished with two mandibles, which are either thick and robust or united with the labium and elongated. The eyes have no palp. The valves are very short, either slightly thickened towards their extremities, or filiform throughout, and composed usually of seven, more rarely (as in the genus Sphaeropus) of six joints. Their eyes are smooth and very greatly in number. These animals move slowly and with a gliding motion. When disturbed, they roll themselves up spirally, or into a ball. They feed on decomposing animal and vegetable matter. The position of the Chilognatha at the head of the Myriopoda, by Latreille and others, has recently been disputed by Professor Brandt and by Mr. Newport. The following remarks on this subject by the latter naturalist, of all living zoologists, the most competent to decide in questions affecting this difficult class, are taken from his catalogue of Chilognatha in the British Museum, published in the 'Annals of Natural History for April, 1844,' and afford in a brief compass much information concerning them. 'The Chilognatha have usually been regarded by naturalists as the first order of Myriopoda, partly in consequence of the larval structure, and partly from the general form of their bodies being similar to that of the larve.' This was the view taken of these animals by Latreille, Leach, Gervais, and others, and very recently by Lucas. But different and, as I believe, more correct view and arrange-
ment have been followed by Professor Brandt, who regards the Chilopoda as the first, and the Chilognatha as the second division of the class. Although I cannot entirely agree with Brandt that the Chilopoda have the mammalian in their massing and sucking species, because, as Lucas has recently remarked, there are species even among the Chilopoda which have the external organs of nutrition fitted only for sucking food, I find, as he does, that they form with him in the superiority of the Chilopoda, as an order, over the Chiliognatha, notwithstanding the less compact structure of the head in the former. The general opinion is certainly right that they are the most perfect animals of the class Articulata. The more compact frame of body, the reduced number of the organs of locomotion, the greater part of the body in the form of the legs and the presence of the higher species, approximate the Chilopoda to the predestined insects on the one hand, and to the Arachnida on the other. The form of the head, in the two divisions of Myriopoda, seems to have reference chiefly to the particular species. Thus, in those which seize their prey and subsist like the Arachnida on living objects, those segments which in reality compose the whole head are not all anchylosed together, but are in part freely movable on each other, and thus allow of a more prehensile function to the large forcipate foot-jaws, the true mandibles of the Arachnida. Some naturalists have believed that those foot-jaws in the Chilopoda are not true mandibles, but 'Chilognatha'; but I am satisfied, by recent examinations, that this is truly the case.

In the Chilognatha the foot-jaws have the form of true mandibles, because the habits of the species require that compact form of the head. In this respect alone can the seizing and piercing of living prey, but to the grinding or comminuting of more or less solid vegetable matter, on which most of the genera of Chilognatha entirely subsist. In all other respects, both in their internal as well as their external anatomy, and in their physiology and mode of growth, the Chilognatha are decidedly inferior to the Chilopoda. They seem to conduct us down to the Annelida from the vegetable-feeding annelids, and thus the Chilopoda do from the Arachnida to the same class.'

The Chilognathous Myriopoda are found in all parts of the world, and certain genera, however, affecting certain geographical divisions. Thus the species of Gomphodes are European; those of Spiractreps and Sphararheus African and Eastern. The genus Tylus, in its most limited sense, includes European, Asiatic, and North American species. Tylus terrestris is a familiar British example.

A synopsis of the genera of Chilognatha will be found in the third part of the nineteenth volume of the 'Linnean Transactions,' appended to a valuable memoir on the Myriopoda by Mr. Newport. Professor Brandt's papers on these animals are published in the 'Transactions and Proceedings of the Imperial Academy of St. Petersburg.'

Mr. G. A. Robinson, the mathematician, was born at Dundee, in 1785, and received the rudiments of education in the public schools of that town. At fourteen years of age he was sent to the university of St. Andrew's; his father, who was then a watchmaker, not to become a clergyman of the church of Scotland. In that university the young man remained six years, during four of which he was occupied with the study of mathematics, languages, and philosophy; but the first of these subjects, from a natural inclination to that branch of science, particularly engaged his attention; he was encouraged and ably assisted in his favourite pursuit by the Rev. John West, one of the instructors at the university; and his great progress, which is said to have excited considerable notice, gave already indications of the eminence which, as a mathematician, he was afterwards to attain. The two following years were passed in the study of theology, and Mr. Robinson then went into partnership and company with Mr. (afterwards Sir John) Leslie, who had been his fellow-student at St. Andrew's, to the university of Edinburgh, where the latter spent one year in completing the course of agriculture which had been deemed necessary, as a preliminary to admission to the office of minister in the church of Scotland.

It is not known what circumstances prevented Mr. Ivory from pursuing a profession of the law. In this respect; but, on quitting the university, in 1768, he accepted a situation as the assistant of a bookseller. He entered an establishment in Dundee, and continued to fulfil the duties of that post during three years. At the end of that time he engaged with some other persons, and established himself in Forfarshire, a factory for spinning flax; and of this association he appears to have been the principal person.

During fifteen years (from 1789 to 1804) Mr. Ivory was employed daily in operations apparently very uncongenial to the taste of a man of science; but it may be presumed that all his leisure hours were devoted to the prosecution of scientific researches, seeing that during this time, that, though residing in a retired district, he diligently cultivated the friendship of the English mathematicians, together with those of the illustrious foreigners whose works were in the public libraries of Scotland. Mr. Ivory obtained access to, and made himself thoroughly acquainted with, the later productions of the continental mathematicians.

It is scarcely to be expected that a factory carried on under the supervision of one of the principal manufacturers of his time was probably spent in researches which require nearly a total abstraction of the mind from the ordinary concerns of life, have should succeeded; accordingly we find that in 1804 the company ceased to exist; and Mr. Ivory, who then obtained the appointment to a professorship of mathematics in the Royal Military College, quitted Scotland, and went to reside at Marlow, in Buckinghamshire, where that institution had, a few years previously, been formed. On the removal of the college to its present site (Sandhurst in Berkshire), Mr. Ivory accompanied it to the latter place, where he remained till his retirement from public service. He fulfilled the duties of his office with energy and success, his attention to the students who were placed under him was unremittent; and it should be remarked that, however irksome it might have been to a man of high attainments in science to submit to the routine of the day of a military professor. Mr. Ivory always evinced the utmost readiness to assist, by the most appropriate and familiar illustrations, in smoothing the path of science to his pupils. An edition of Eudoc's Elements, which is known to have been his work, though his name do not appear on the title-page, was prepared by him for the use of the students in the college; and the manner in which he has treated the book on proportion, and those which relate to solid, must have greater merit with all the connoisseurs which the generality of learners experience in acquiring a knowledge of those parts of elementary mathematics.

In the beginning of the year 1819 Mr. Ivory, feeling his health decline under the great exertions which he made in carrying on his scientific researches and performing his duties as a professor, those duties leaving him but short intervals of leisure, was induced to resign his professorship and retire into private life. In consequence of his great merit there was granted to him the pension due to the full period which, by the regulations, the civil officers of the institution are required to serve previously to obtaining such pension; and which period he had not completed. After his retirement from Sandhurst, Mr. Ivory devoted himself wholly to scientific researches, and the results of his labours have been printed in a little periodical of the 'Philosophical Transactions.' In 1831, in consideration of the great talent displayed in his investigations, he was by Lord Brougham, to whom he had been known in early life, recommended to the king (William IV.), who, in the following year, placed him as a member of the Royal Society, gave him an annual pension of 900L., which he enjoyed during the rest of his life; and, in 1839, the University of St. Andrew's conferred on him the degree of doctor in laws. He lived in great private in or near London till the time of his death, which happened September 21st, 1842, in the seventy-seventh year of his age.

Mr. Ivory's earliest writings were three Memoirs which he communicated in the years 1796, 1799, and 1802, to the Royal Society of Edinburgh: the first of these was entitled 'A New Series for the Rectification of the Ellipse,' the second, 'A New Method of resolving Cubic Equations'; and the third, 'On the Third and Fourth Problems of Elliptick Sections.' All of these works displayed a great originality of thought. He contributed fifteen papers to the 'Transactions of the Royal Society of London,' nearly all of them relating to physical astronomy, and others to the mathematical investigations of the most refined nature. The first, which is entitled 'On the Attractions of Homogeneous Ellipsoids,' is to be found in the volume of 1806, and contains investigations of the attractions of such ellipsoids as are surrounded with them and on their exterior; the former case presents few difficulties; but the process used by Laplace for the solution of the latter was very complicated, and the merit of discovering one which is remarkable for its simplicity. A given point being on the exterior of an ellipsoid, he insta-

million to be the timber of a Brazilian Mimoso.

(Burnett, Outlines of Botany.)

JACKSON, JOHN, R.A., was born in 1778 at Lasting-
hurst, in Hampshire, where his father was a tailor, and he was himself bred to the same business.

He however hated his occupation; he had seen the collection of Lord Malgrave, and the pictures at Castle Howard, and he had made an ambition to become a painter, a form of which he made to imitate a picture by Reynolds was shown by his schoolmaster to Lord Malgrave, who perceive in it and others, notwithstanding their crudeness, some talent, supplied Jackson with proper materials, and encouraged him to go on. Lord Malgrave and Sir G. Beaumont purchased the two years of Jackson's unexpired apprenticeship, and the latter in 1797 gave him an allowance of 50l. per annum, and an apartment in his house in town, to enable him to prosecute his studies at the Royal Academy.

Jackson soon obtained a name for his portraits in black lead-pencil and water-colours, but it took him many years to equal the successful oil-painters of that day. He first attracted notice in this department about 1806, and in 1817 when he was elected a member of the Royal Academy, his reputation was little inferior to that of Lawrence, though he was comparatively little patronized; his portraits were bold and effective, but they wanted the dexterity of the works of Lawrence: Jackson could paint five heads while Lawrence was painting one. In the summer of 1819 he visited Rome in company with Chantrey, and painted for him there a portrait of Canova. Jackson astonished the Roman painters, says Cunningham, by copying in four days the Borghese Titian of Sacred and Profane Love as it is called, a picture which many men have required more than three month to copy; Passavant says, the figure of Divine Love, in three days, which is more likely; the rest of the picture is scarcely worth copying.

Jackson was elected a member of the Academy of St. Luke, at Rome. He was in all his works extraordinarily rapid and sure. A story is related, that he commenced and finished in a single summer's day, as a wager, the portraits of five gentlemen; he received 25 guineas for each of them—125 guineas in one day; probably no painter ever earned as much by his own labour before. The story is told by Passavant. Jackson died at his house in St. John's Wood on June the 1st, 1861. His best works are the portraits of Lady Dover, of Flaxman, and of himself, both painted for Lord Dover, and the portrait already mentioned of Canova. He painted in all the portraits of thirteen of his fellow Academicians, but that of Flaxman, is in all probability the best. All the shallow observers will see in this picture, that there is a 'sombre grandeur about it which awes one', it is certainly one of the finest portraits in the world.

Jackson exhibited in all, at the Royal Academy, between the years 1804 and 1830, one hundred and forty-five pictures, of course painted very many portraits that were not exhibited, for he was latterly constantly employed. His nominal price for a head was fifty guineas, and though he must have been making a large income, he died without leaving a provision for his family. He was twice married; his second wife, who survived him, was the daughter of his fellow-academician, Ward.

(Cunningham, Lives of British Painters, &c; Passavant, Kunsträtsche durch England, &c.)

JACKSON, ANDREW, the late American general and president, was himself a native of the United States; although his father, of the same names, was an Irishman, the youngest of the four sons of Hugh Jackson, a linendraper near Carrickfergus; and either the linen-drawer himself, or one of his recent progenitors, had come over from Scotland. Andrew Jackson was born in 1767, and is said soon after to have been a member of a band of wanderers, who after various adventures, had taken possession of a farm near Pontic, North of Ireland; Monree, Jackson, and the present President, Polk. (1846)

Andrew, her latest born, appears to have been his mother's favourite; and the original destination of the future General and President of the United States was to be a clergyman, we are not informed of what denomination. With this view, after having for a short time attended school education, he was sent to the Waxlaw Academy; and here he studied theology for some years. When the war of independence, however, made all Americans soldiers, the young Jackson seems to have taken a quick advantage of the situation in which he found himself, and his army career was so rapid that he fought, along with his next oldest brother Robert, under Sumter in his attack on the British garrison at Rocky Mount, on the 6th of August, 1780; at which date he would be little more than thirteen. And from this time he is stated to have taken a part in the campaigns as long as the war lasted. Nor did he altogether escape the usual dissipated habits of a military life; but, with the decision of character which was his most remarkable characteristic, he suddenly changed his course before it was too late, and, collecting what remained of his means, put himself, in the winter of 1784, into the hands of Spruce Mc'Gay, Esq., an eminently active and afterwards a judge, to be instructed in the practice of the law. This new study he prosecuted with so much success that in 1787 he was appointed solicitor for what was then called the Western District of North Carolina, and is now the State of Tennessee. The circumstances of the time, however, did not suffer him, even if he had been so inclined, to throw off his military character, or to let the experience he had gained in camps and campaigns go to rust. Although the war with the mother country was over, the borders of the republican territory were still infested with another most troublesome enemy in the original occupants of the soil; and Jackson, although he would only serve as a private, is said to have so much distinguished himself, that he was in a very short time elected a member of the State convention as a delegate from the county of Tennessee.

He was chosen a member of the State convention, and in the year 1789, he was chosen a member of the State convention, and in the year 1790 became a member of the State legislature, and was chosen a member of the United States congress. He was chosen a member of the United States congress. He was chosen a member of the United States congress. He was chosen a member of the United States congress.

He continued to be thus employed till the year 1796, when, after having first acted as one of the members of the Convention for establishing a constitution for the state of Tennessee, he was, under that new arrangement, elected to a seat in the House of Representatives. The next year he was chosen a Senator; but he resigned his seat after holding it for one session. On this he was immediately appointed by the legislature of Tennessee Judge of the Supreme Court in that state; having also been shortly before chosen a Major General of the state forces. But he soon resigned his judicial office; and, settling himself on a farm, a few miles from Nashville, on the banks of the Cumberland, he remained retired, living out of the war with England in 1812. With that event commences the most memorable portion of Jackson's career.

His first command was that of a body of between two and three thousand volunteers, who had assembled for defense, and with whom he was directed to proceed down the Mississippi for the defence of the lower country, this was in November, 1812. The next year he greatly distinguished himself by a campaign against the Creek tribes. An account of it may be found in a message from the President (Madison) to Congress, dated 7th December, 1813, in which it is stated that the best hopes of a satisfactory issue of the contest were already warranteed by the complete success of a well-planned enterprise against the Indians, executed by a detachment of the volunteer militia of Tennessee under the command of General Coffee; and by a still more important victory over the larger body of them, gained under the immediate command of Major General Jackson, an officer equally distinguished for his patriotism and his military talents. The Creeks were repeatedly afterwards defeated by Jackson. The boundaries of the territory were determined in the year 1813, by which they agreed to lay down their arms. (Message of President Madison, dated 20th September, 1814.)

In 1814 Jackson was appointed a Major General in the service of the United States; but he resigned his commission after, and, in the course of other operations, he succeeded in taking Pensacola on the 7th of November, and raised himself to the highest point of reputation and popularity among his countrymen by the famous victory at New Orleans, on the 8th of January, 1815. The next military command which he held, that of
the war against the Seminole Indians of Florida in 1818, for the
purpose of seizing territory which previously belonged to the
Monroe's Message to Congress of the 16th of November in
that year, and to the Report of the Committee of Senate on
the Seminole war, dated 24th February, 1819. Jackson's
presentation of the same, in the Senate, was not irregular and high-handed; the force at the head of which he
placed himself was raised and officered not only without but
in direct opposition to the orders of the general government;
in particular, he had his own men, not the men he had been
ordered to seize, one after another, several forts and ports be-
longing to Spain, with which country the United States were
at peace, and to put down the Spanish authorities by the power
of the United States. Jackson had been warned of the disapproval in the most emphatic manner, by the immediate
restoration of the places thus unwarrantably seized; but his
extraordinary act was the execution of the two English-
men Arbuthnot and Ambrister. Alexander Arbuthnot was
taken in the Spanish Fort of St. Mark's, along with two
Indian chiefs, and Robert C. Ambrister, a few days after-
wards, on an excursion which the force made from that post
to destroy a neighboring Indian village. The two Indian
chiefs were hanged at once, and without trial; the justifica-
tion urged being that by their own usual practices in like cases,
and by the general manner in which they carried on war, the
United States had been considered as having put themselves
beyond the pale of the ordinary law of nations. Arbuthnot
and Ambrister were both, after a few days' confinement, tried
at St. Mark's by court martial; when Arbuthnot was sen-
tenced to death, the public justice of the United States was
further confused; but General Jackson annulled the latter
sentence, and Arbuthnot was hung and Ambrister shot.
There is no doubt that these persons were acting in concert
with the Indians; and, that being the case, it would perhaps
be difficult to show that they were entitled to other treat-
ment than those with whom they had associated themselves.
But even to take the lives of Indian prisoners of war was an
extreme proof of an abuse of very doubtful propriety; the
charge upon which the two Englishmen were tried was only
the very vague one of 'insulting the Indians to war;'
in these circumstances it was certainly startling evidence of
military action entirely general, under the most popular of
all governments, to set aside the sentence of a court martial,
as was done in the case of Ambrister. Besides, the principle
upon which General Jackson took his stand was even less tenable
than the one we have just stated; he himself vindicated what
he had done, on the ground that Arbuthnot and Ambrister,
by assisting in war against the United States while they were
at peace with Great Britain, became outlaws and pirates;
thus resting their liability to suffer death, when taken
prisoners of war, not on the ground of their having united
their fates with savages, but on that of their having been the
subjects of the same power to which they were enemies,
peace; a principle altogether unknown to the law of nations.
However, although a stout fight was made in Congress by the
opposite party, Jackson's friends, supported by the feeling out
of the movement of the people, he was enabled to force a democra-
tic professions bore down everything, carried a succession of
votes in his expulsion by large majorities.
General Jackson afterwards acted as commissioner on
the part of the United States in the negotiation with Spain for
the transference of Florida: and after the arrangement of the
treaty to that effect, he was, in 1821, appointed the first
Governor of the province. He held this post for a year, and
was then again elected a member of the Senate for the State of
Tennessee.
When the election of a new president came on at the end
of 1824, General Jackson was a candidate along with Mr.
Andrew Jackson was a candidate along with Mr.
Andrew Jackson. Mr. Clay's bronze medal for the first time
he had a large majority over the nearest of his competitors:
the numbers being Jackson 101, Adams 82, Crawford 41,
Clay 37. No candidate, however, having the majority re-
quainting the House of Representatives; and Adams and Clay
having united their strength, the former obtained the votes of
thirteen states against seven who voted for Jackson and four
who voted for Adams. Jackson, however, was triumphantly
elected in 1828, and again in 1832; so that he was at the head of the government of his native
country for the eight years from 1828 to 1837. His policy
depended for the most part upon the rapid growth of the
appearance of democratic tendencies of all kinds; and, at the same time, of both the spirit of territorial extension, with its near conse-
quences, conquest and war, and of the influence of the southern
states and the slave interest in the hands of the president, to
which the president personally came forward in the most
conspicuous manner was in the affairs of the United States
Bank. This bank, the renewal of its charter of which was
the ostensible motive for that intervention of the executive, was
in the hands of the general government; and hence the
renewal of its charter, though supported by both Houses of
Congress, was resisted, and successfully, both by the popular
voice and by the voice of the administration; the former by
offices, and who had been one of the most ardent and resolute
of the democratic leaders throughout his life.
General Jackson survived his presidency about eight years,
and died at his Chippewa house, near Nashville, Tennessee,
on Sunday the 8th of June, 1845. He was married,
but had no issue.

(Biographical Notice in New York Weekly Herald, of 21st of June, 1845; Funeral Oration delivered by Mr. Bancroft at Washington; Histories of the Time.)

JACQUARD, JOSEPH-MARIE, was born at Lyon, on
the 7th of July, 1764, of humble parents, both of whom were
employed in operations connected with weaving. He is said
to have been left to teach himself even to read and write; but
at a very early age he displayed a taste for mechanics, by con-
structing new models of buildings, furniture, &c. for amuse-
ment. At the age of twelve his father placed him with a
bookbinder for a time, and he was subsequently engaged in
type-founding and the manufacture of cutlery, in both of
which occupations he gave evidence of talent. Owing to the
death of his mother early and in extreme destitution, and
occupation of his father, who also died some years after,
leaving him a small property, which he employed in the
attempt to establish a business in the weaving of figured
fabrics. The undertaking failed, and he was compelled to sell
his looms in order to pay his debts. He subsequently
married, and hoped to receive a portion with his wife which
might assist him out of his pecuniary difficulties; but this
expectation proved delusive, and he was compelled to sell his
paternal residence. His wife, to whom he is said to have
been tenderly attached, is described as a model of patience,
kindness, and industry; while he appears, without fortune,
ambition, or foresight, to have occupied himself in various
schemes for improvements in weaving, cutlery, and type-
founding, which produced nothing for the support of his
family. Necessity at length compelled him to enter the ser-
vice of a linen-maker in Bresse, while his wife remained at
Lyon to attend to a small straw-hat business. In 1792 he
ardently embraced the revolutionary cause, and in the follow-
ishing year he returned to Lyon, and assisted in the memorable
defence of that place against the army of the Convention; his
son, then a youth of fifteen, fought by his side. Being
beneath the reduction of the Lyon, they were both com-
missioned to fly, and for a time they were supplanted.
His son was killed in battle, and upon this Jacuard returned
to Lyon, where he found his wife, whom he had been unable
to inform of his flight, bearing her bread by plaiting straw,
in which humble employment he was enabled to assist. Lyon at length began to rise from its ruins, and its
departures returned from Switzerland, Germany, and England,
where they had taken refuge. Under these circumstances,
Jacuard applied himself with renewed energy to the per-
fection of the beautiful apparatus for figured weaving which
bears his name, and which is described under Weaving, P. C.,
pp. 178, 179. He had conceived the idea of such an ap-
paratus as early as 1789, and he now succeeded, though
imperfectly, in accomplishing his end. His machine
was presented, in September, 1801, to the national exposition of
the products of industry, the jury of which awarded him a
medal. From this time he obtained a patent, or 'brevet d'invention,' for a term of ten years. He
set up a loom on his new principle at Lyon, which was visited
by Caram and several other of the statesmen who were as-
ssembled at that city in 1802 to arrange the affairs of the
Cispalpine republic.
About this time the attention of Jacuard appears to have
been directed, by the accidental discovery of an English
newspaper, to the fact that a reward was offered by a
society in this country for the invention of such an apparatus,
to the construction of a machine for weaving nets for fishing
and maritime purposes. From this time Dr. Bowring, who had conversed on the subject with Jacuard himself,
before a Select Committee of the House of Commons on
the silk trade, in 1822, and which is made the subject of

P. C. S. No. 100
Vol. 11. 4
an article in No. 50 of the 'Penny Magazine,' published in 1833, this would appear to have been Jacques' first mechanical invention by the more correct title given in its 'Supplément' to the 'Biographie Universelle,' to which we are chiefly indebted for the materials of this article, shows that such was not the case. He accomplished the desired object in a manner prescribed to himself and his friends with the utmost contrivance, he threw it aside. His machine-made net, how-
ever, fell into the hands of the prefect at Lyon, and the result was that, according to the arbitrary fashion of the time, he and his friends were placed under arrest and conveyed to the city of Paris, where the invention was submitted to inspectors, upon whose report a gold medal was awarded to him in February, 1804. On occasion of this forced visit to Paris, Jacques was introduced to Napoleon and Carnot, and on the latter's understanding his mechanism, roughly asked him if he were the man who pretended to do that impossibility—to tie a knot in a stretched string. Jacques, not disconcerted at such a reception, explained the action of his machinery with sim-
plicity, and convinced the incredulous minister that the sup-
posed impossibility was accomplished by it. He was then employed for a time in repairing and putting in order the models and machines in the Conservatoire des Arts et Métiers, and while there he produced some ingenious improvements in weaving machinery, one of which was for producing ribbons with a velvet face on each side. He also contrived some im-
provements for Jacquard's loom, which improvements are now used with a great success, the machine's mechanism is very complex, its application limited to very small patterns, its action slow, and its cost very great, it is con-

templated to belong rather to the class of curious than of useful machines.

In 1804 Jacques returned to Lyon, where he was long engaged in superintending the introduction of his inventions for figured weaving and for making nets, in which he was powerfully aided by Camille Pernot, a rich manufacturer. Through his assistance, a commission of manufacturers was appointed to report upon the first-named invention, and event-
ually an imperial decree, dated Berlin, October 27, 1806, was issued to authorize the municipal administration of Lyon to purchase his invention for the use of the public. In the same year the Academy of Sciences and Arts at that city pre-

tented him with the prize medal founded by the consul Lebrun. For some years Jacques had to struggle against much opposition and prejudice on the part of the Lyonese weavers, who conspired to discourage the use of his machinery, willfully spoiling their work to bring it to discredit, and through the Consul Prud'hommes, who were appointed to watch over the commercial interests of the city, had it pub-
licly broken up and sold as old materials. Even his personal safety was endangered. At one time, however, under the 

effect of foreign competition, the value of the invention was increased, and it was brought very extensively into use, not only in France, but in Switzerland, Germany, Italy, Austria, according to the 'Biographie Universelle,' it has been introduced even into China.

Jacquard was solicited by the manufacturers of Rouen and St. Quentin to organize their factories of cotton and batiste, and he received a tempting offer of a similar nature from Eng-
land; but he preferred remaining at Lyon, where he con-
tinued to exert himself in promoting the use of his great invention until, having lost his wife, he retired to Oullins, a village near Lyon, where he spent his latter years in retire-
ment, and died on the 7th of August, 1834, at the age of eighty-two. During his life he received the cross of the Legion of Honour, and in 1840 a public statue was raised to his memory. His 'Elége Historique' has been pub-
lished by M. de Fortis.

The name of Jacquard, \textquoteleft observe the writers of his memoir in the 'Biographie Universelle,' \textquoteleft has become, so to speak, technical, a sort of old and new word to denote a fabricator of the efforts of Jacquard, who, like him, was en-
gaged at Lyon in the improvement of weaving machinery. Jacquard has invented a simple and cheap machine, coming with the looms, and the handlooms were abandoned, which forms a memorable epoch—a new era—in the textile art.' By its agency the richest and most complex designs are produced with the city at the most moderate price; and, from so far diminishing expenditure on the importation of cloth, it has, according to the writers just quoted, in-

JAMESON, GEORGE, called by Walpole the 

Vandyck of Scotland, was the son of Andrew Jameson, an architect, and was born at Aberdeen in 1856. Jameson and Vandyck were about 1616 fellow-pupils of Rubens at Antwerp. When Charles I. visited Edinburgh in 1629, he sat to Jameson, and presented him with a diamond ring from his own finger. His career is not exactly known, but it must have been a successful one, for he left his wife and family well provided for at his death in 1644; and he is supposed to have changed his direc-
tions. He was probably in Italy, for his portrait is in the painter's portrait gallery at Florence; he travelled in com-
pany with Sir Colin Campbell of Glenorchy. Many of the con-
structions of Sir John and Jameson, who lived at Auchincruive, but the greatest collection is at Taymouth, the seat of the Earl of Breadalbane. Sir Colin Campbell, the earl's ancestor, was Jameson's first and chief patron. In a manuscript con-
taining the history of Sir Colin, there is mention of several portraits painted by Jameson for Sir Colin, with memoranda of the prices paid. For portraits of the king, Sir Robert Bruce, Charles I. and his queen, and for nine queens of Scotland, painted in 1615, Jameson received only 260 Scotch pounds, or 20 pounds per portrait, which is equal to 11. 18s. 4d. sterling; the Scotch pound was twenty pence. All other portraits painted for Sir Colin, which were not paid for at the time, are included in several of Jameson's pictures also in the two colleges of Aber-
deen. There is a portrait of Jameson by himself at Cullen House; he appears to have often painted his own portrait, and he always painted himself with his hat on, which he may have done either in imitation of Rubens, or on having been granted that privilege by Charles I. when he sat to him. Though the pupil of Rubens and the companion of Vandyck, Jameson's works have neither the fulness nor richness of the former, nor the vigour of the latter; they are however painted very thinly and with much nature, but there is a sharpness in his outline which reminds one of a very different school from that of Rubens. 'His excellence,' says Walpole, 'is said to consist in delicacy and softness, with a clear and beautiful coloring, his shades not charged but helped by varnish for the expression of places. . . . It is remarkable,' says Walpole, 'that anything which Jameson's countryman Cunningham in quoting this passage has added the following words to it as coming also from Walpole—"He had much of Vandyck's second manner; and Amosis and Angoby have of some of his works have been occasionally imitated.' These words are not in Walpole, at least not in the edition of 1782.

Jameson's earliest works are painted on panel; he used afterwards fine canvas, smoothly primed, and varnished in a shade tint. He painted occasionally history, miniature, and landscape. Walpole mentions a view of Edinburgh by him. Cunningham has ascribed to Jameson the illuminations of a manuscript of two hundred leaves of parchment, illustrating the Life of Christ, which belonged only to Jameson, and which he valued at 2000. Sterling. Jameson himself describes it as a manuscript in his possession containing two hundred leaves of parchment; brilliant, excellent writing adorns the borders of our Saviour curiously lined.' This memorandum was in the possession of his descendant, Mr. John Jameson, a wine-
merchant of Leith, from whom Walpole (or ra lar Vere) obtained a copy of the same manuscript. Jameson. It is not known what has become of this manuscript.

Cunningham speaks of Jameson as without a native rival in Great Britain; he appears to have overlooked Dobson, some of whose portraits are introduced to the present discussion. Jameson's daughter Mary excelled in embroidery, in textile paintings; some of her works are still preserved in the church of St. Nicolas, at Aberdeen.
JAMIESON, JOHN, D.D., is best known as the author of the Scottish Dictionary, but he published many other literary works. In 1817 he brought out his Life and Correspondence, which is still in demand and extremely valuable to students. His work, which was published in 1817, was well received and has since been reprinted several times.

Jamieson (so he himself spelt the name, though he made his children drop the i) was born in Glasgow, 3rd March, 1793. His grandfather was a man of some note in the theological world, and was a member of the two congregations of Secederists (that is, Presbyterian dissenters from the Established Church), which then comprised all the persons of their denomination in that city; this office he held for many years, struggling with ill health and an income of less than a hundred a year. The Seceder minister's family connections, however, were very good; and the course of his son's life was much influenced and coloured by that circumstance. Mr. Jamieson had been a Miss Cleland, whose mother was a daughter of the Rev. Robert Bruce of Garbot, son of a younger brother of Bruce of Kennet, in Clackmannanshire, a family allied to many of the high and influential families of the county. His grandfather, at the age of 84, was delivered of a son, the father of the line of Bruce with the ears of Elgin. These Bruses of Kennet had always been staunch Presbyterians; but it is remarkable that he has been a member of the Established Church, a remarkable instance of the change in the religious views of the Episcopalian. His son was so ashamed of this fact, that young Jamieson never could learn from him of what religion his grandfather had been, and it only occurred accidentally to his knowledge late in life. In those days especially the Seceders were distinguished even among other Presbyterians for their rigid and exclusive Presbyterianism.

The subject of the present notice remained throughout his life a steady, but by no means a narrow-minded Seceder. His mother's relations, taking him by the hand, early introduced him extensively into general society, and his literary tastes and associations further helped to liberalize him. Yet even after he numbered among his intimate acquaintances and friends many persons of great eminence and influence, and had become known in literature, his worldly circumstances continued extremely narrow. He was in fact kept back rather than brought forward by the governing bodies in his sect, in which, under a profoundly more popular constitution, the author of the clergy in their courts is, or at least was, nearly as much his master as that of the Conference among the Wesleyan Methodists.

The chronology of his life may be given in a few sentences. He was sent to the university of Glasgow when he was only nine years old. He was already conceiving at this time of the studies and life of a professor, and made preparations for the academy. In 1807, he entered upon the study of theology at the age of fourteen, under the Rev. William Moncrieff, who lectured on that subject to the young men intimated for the Seccesion ministry at Ailsa. After having been at Glasgow a year, however, he attended the lectures of Dugald Stewart on the disputation of 1763, attended lectures of the same nature. In July, 1779, having just completed his twentieth year, he was licensed as a preacher by the Seceder Presbytery of Glasgow. For some time he was employed, as the practice in his communion is or was, to do duty without any fixed engagement; first at Clonmel in Ayrshire, then in the Isle of Bute, then at Cowal in Argyllshire, and at various places in Perthshire and Fife. He was finally assigned to him the parish of Forfar, under the direction of the associate of the Royal Society of Literature from its institution till the general withdrawal of the allowances on the accession of William IV. In 1836 a pension to the same amount was assigned to him by the government, and he retained it till the 12th of July, 1838, leaving only one son, Mr. Farquhar Jamieson, a banker in Paris, of five that had reached the years of manhood. His second son, Mr. Robert Jamieson, had died a few years before, after rising to considerable distinction at the Scottish bar.

JAN MAYEN ISLAND is an island in the Arctic Polar
Sea, lying between 70° 49′ and 71° 5′ N. lat., and between 77° 15′ and 80° 45′ W. long. It extends from south-west to north-east about thirty miles, and is in no place above nine in breadth; at some places it is less than two miles. On the northern extremity, where the island is widest, stands the magnificent bay or harbour of Tain, a pleasant retreat, from 6670 to 6670 feet above the sea-level. It frequently shows its snow-capped summit above the clouds, and rests on a rocky mass 1800 feet high. In other parts the rocky masses appear to be a continuation of between 1800 and 2000 feet. A large portion of the island is composed of lava and other volcanic matter, and two craters have been discovered on the eastern side; smoke and fire have been observed in these places.

Even in the beginning of August all the high lands are found covered with snow and ice, and the low lands in those valleys and deep cavities where large beds of snow have been collected, retain part of their covering to the very border of the sea. At the foot of the Beerenberg are three very singular glaciers; they occupy recesses in the cliff where it is more than 1200 feet high, and nearly perpendicular. They are very rough on the surface, and of a greenish grey colour. They present the appearance of immense cataracts suddenly arrested in their progress and congealed by the power of an intense frost. Like cascades, their prominent greenish colour is variegated with snow-white patches, and is deepened by the jet-black points of the most prominent rocks peeping through their surfaces.

The coast has several roadsteads with good anchorage in five fathoms of water, black sand, but no harbour for a ship, all the anchorages being open to the sea in an angle of at least ten points of the compass. The soundings about the island are very irregular, and the bottom generally consists of rocks or black sand. The western navigation of the island is difficult, but the eastern comparatively safe. Jan Mayen is preferred to the eastern, as being less encumbered with ice and less subject to calms, squalls, and whirlwinds, which are often encountered in passing to the east of Bear Island. The coast is divided into three parts, viz. the spring of the year; but in autumn, and even in summer, the ice sometimes sets so far to the westward that it is not visible from any part of the land.

There are foxes and white bears, and perhaps also reindeer. Water-fowl are numerous, especially burgomasters, fulmars, puffins, guillemots, little auks, kyttywalks, and terns. Several cetacean animals abound, principally of the species Balma Physalis. The vegetation is very scanty, and limited to a few species scattered widely about among the volcanic minerals. Iron has been observed at several places.

The island was discovered in 1611 by a Dutch navigator called Jan Mayen, and was visited about 1680 by a sort of account of the great number of whales, which, however, afterwards retreated to other parts of the Arctic Sea. In this time (1680) the Dutch seamen wintered here, probably for the purpose of obtaining turtle, and they kept a regular journal. But on the arrival of the Dutch fleet in the following June all were found dead in their huts. From this journal it appeared that many had not been killed by the frost but by the scurry, which had attacked them for want of fresh provisions. Their journal terminated on the 31st of April.

JARDYN, KARLE DE, one of the best of the Dutch landscape, pastoral, and genre painters, and the most distinguished of N. Berghem's scholars. He was a native of Amsterdam, and lived some time in Rome, where the Flemish painters gave him the nickname of Bokkehoert (goat-beard). He died at Venice in 1678, aged about forty. There are many spirited etchings by his hand.

(Baillie, Groote Schooneberg, &c.; Bartch, Peinture-Gravure.)

JASIONE, a genus of plants belonging to the natural order Campanulaceae. It has a 3-leaved rotate calyx, auriculate, which forms a sort of flange at the base, a large green calyx, and 2 large white or lilac capitula opening by a large and somewhat valvular pore at the base. There is but one British species of this genus. J. mutabilis has a simple root, bluntish oblong wavy leaves, and a flower-stalk 6 inches high. The flowers are 1 inch long, pilose, simple, or branched: leafy below, bare and glabrous above, and ascend from the crown of the root. The flowers are small, in terminal bracteate heads, having a light blue color.

(Rabbin, Manual of British Botany.)

JAVOLYNUS PRISCUS, a Roman jurist, from whom there are a few excerpts in the Digest. His period is not quite certain, but he was born a few years after Caesar Augustus (31 B.C.) as a successor of Cæcilius Sabinius, and he accordingly belonged to the Sabini; and some writers place him in the time of Nerius and Hadrian. He was the master of Balbius Julianus. He may be considered as a Jurist of the second and third centuries. His chief work is a treatise, 'De aliquibus legibus,' concerning the Roman law, the title of which is placed on the title-page of the edition of which I have a copy. It is a very valuable work, and is often quoted by modern jurists.

(Jerome, Sir John, was born in Guernsey, August 18, 1795, and was the eldest son of the late John Jerome, a distinguished advocate of the Royal Court of that island. At an early age he was sent to the Universities and his acceptance, Tiverton, but his studies were soon interrupted by the premature death of his father. Upon his return to Guernsey he devoted himself to the study of law, which he completed during the winter of 1812. In his practice he rose rapidly, and before the commencement of his public life, he distinguished himself before the royal commissioners, sent over to Guernsey to correct certain abuses in the laws and administration of justice in that island. He was afterwards retained in many difficult cases, both civil and criminal, and soon acquired a high character for independence and energetic zeal in the discharge of his professional duties. On more than one occasion he was chosen by the people of Guernsey to represent them in the Privy Council, where his talents and eloquence found a larger sphere for their action, and brought him before the notice of government.

In October 1824, he was appointed to the office of Chief Justice of S. Louis, in the West Indies. 'At the time the tender of an appointment was made to him,' he observes, in his Essays on Colonial Slavery, 'he was unacquainted with a single individual in the service of the colonial department, and his political opinions were rather adverse to the then existing government. On the question of slavery he was thoroughly indifferent; indeed, it was so remote from his usual pursuits, that he may fairly say he had never given it a thought. In the intervals between the first proposal and the acceptance of his office, his professional avocations brought him to England, and on this occasion, probably owing to this proposal, his curiosity prompted him to make an annual sojourn. The impression made upon his mind was rather favorable to the views of the abolitionists. He heard much declamation, much angry and eloquent declamation; but accustomed from early life to sober and dispassionate thinking, he could not but have a deficiency of facts and of evidence on which to found his views. It was under this impression that he went to the colonies, and the candid expression of his feelings on the subject of slavery, which we have quoted, must acquit him of any bias in favor of its abolition, and proves that his subsequent devotion to the great cause of emancipation was the entire result of a conviction pressed upon him by an actual knowledge of the evils of the system. No sooner, indeed, was the slave law of 1831 promulgated, and the slave enjoyed the liberty of freely communicating with his protectors, than numerous examples of revolting cruelty, brought before him in his official capacity, introduced him to the idea of lasting change. He does not pretend to the extent of his inquiries was the depth of his conviction that the only remedy to the evil of slavery was the gradual emancipation of the slave. His views on this important subject were 'Fallacies and Canoons; or Slavery, as a Moral and Political Evil,' which he published on his return to Europe in 1831; in them he describes the general features of the slave communities, and the beneficial effect of the ameliorations already commenced. He recommended further measures, and the further measures required for the entire annihilation of the system. The principle by which he was actuated in publishing these essays will be seen from the following extract. 'Such them,' he says, 'is the unavowed motive which has actuated the West Indian communities; nor can they complain that they are anonymously maligned, that they are
guilted on rumor or insufficient evidence, or that sentiments are now expressed different from those which he was known to entertain when among them. Such sentiments, he held, urged them in the want of law and convenience; he had repeated them from the judgment-seat in the sternness of duty, with the still sterner proof before him. They are now published, neither vindictively nor in anger. Moreover, he has acquired the painful conviction that publicity alone can lead to a thorough reformation.

The year 1839, he was appointed to the office of Procurer and Advocate-General of the Mauritius. He had there to contend not only against objections of a personal nature, arising from known opinions on the slave question, but against national and deep-rooted antipathies of a population almost entirely of French origin, and strongly attached to French institutions. The office, moreover, which he held presented peculiar difficulties to one who was determined conscientiously to perform the duties it imposed. It was an error to assimilate it to that of an English attorney-general; they are only so far similar that they both fulfil the duties of a public prosecutor. The procurer-general, among the French, is an executive magistrate, and has to enforce the decrees of the courts, and he has under his control the police force of the country. When the disaffected party at the Mauritius heard of Mr. Jeremie's appointment to an office which, we believe, had a more effectual influence into the legal system than into the government, they broke out into an almost open rebellion. On his arrival before Port Louis, so great was the fear entertained for his personal safety by the British authorities, that all access to the house of residence was forbidden, and the assiduousness with which the governor had petitioned the governor altogether to prevent his landing; their request being refused, after a detention of two days he went on shore, under the protection of the whole naval and military force in the island, and on the same day was sworn into office, at a meeting of the legislative council.

The many scenes of violence which ensued are fully detailed in a pamphlet entitled 'Recent Events at the Mauritius,' which has published in vindication of having the authority of the court and the government. It will not be necessary to mention that the governor thought it advisable, for the security of the public peace, to order him to return to England, he having previously declined to do so, except with a written command, which was given him to that effect. On his arrival in London he immediately reported himself to the colonial office, adding, that he was ready to resume his journey back to the Mauritius at an hour's notice. His request, though delayed, was granted, and his return to that island preceded by an additional military force. The feelings, however, originally excited against him did not easily subside, and his residence there, which terminated in 1836, was embittered by a series of painful events arising from the fever advocacy of his opinions. Within three years, to use his own words, he had traversed fifty thousand miles, encountered the assassin on the shore and the penknife in the reading-room, in the service of the crown every peril to which life is subject, whether from the ocean, from climate, or from the hand of man.

In the year 1836, he was appointed to the office of judge of the Supreme Court of Ceylon, and during the same year he received a gratifying proof that his devoted zeal in behalf of emancipation had been fully estimated by the British public. A valuable piece of plate was presented to him by the Anti-Slavery Society; the inscription upon it testifying that 'by his disinterested, able, and energetic exertions in most critical and painful situations, both at home and abroad, negro freedom had been largely advanced, and the negro character raised to its just standard in public estimation.'

His residence during four years at Ceylon was the only tranquil period of his eventful life. Early in the year 1840, he stated in his pamphlet 'Civilization,' addressed to Sir J. F. Burton, 'It is the description and shows, what he considers will be the future effects of emancipation in the colonies, and gives a short outline of the progress of the sciences, and advance the civilization of Western Africa. He looks upon the emigration of the emancipated negro of the West Indies to the land of his origin as one of the most likely means of advancement.'

He says, 'we must look for the regeneration of Africa. To a reflex of the west upon the east, in moderate numbers, and managed with caution, must we look for the civilization of the east.'

It was to carry into effect the measures which had been suggested for ameliorating the condition of the liberated slaves that, undeterred by the perils of a pestilential climate, he accepted, in October, 1840, the important office of Governor and Commander-in-Chief of Sierra Leone, a colony of great value, and on the same day received the honour of knighthood. On the 23rd of April, 1841, only four months after his arrival and the Sierra Leone, a colony of great value, and on the same day received the honour of knighthood. On the 23rd of April, 1841, only four months after his arrival and the

To his earnest request, accompanied his father as private secretary, which appointment he held under the succeeding Governor until 1843, when he likewise fell a victim to the climate. Of Sir J. Jeremie's character, very few can form a just opinion, as the singular services of his widow, the constant sharer of his perils, alone survives. The inhabitants of St. Lucia, when the news of his death reached them, marked their regret for his loss by a general mourning. But perhaps the most gratifying tribute to his memory is to be found in an address made on that occasion to the Royal Court of St. Lucia by his friend Dr. Reddie, who had succeeded him as chief justice of that colony. The following passages are contained in it:—'To say that Sir J. Jeremie was the ablest judge, was the most useful judge, who ever presided at St. Lucia, is saying little indeed. For the laws which he enforced, and the reforms which he introduced into the legal system by a series of measures of importance and by a recovery of the works of the court and the government, which was given him to that effect. On his arrival in London he immediately reported himself to the colonial office, adding, that he was ready to resume his journey back to the Mauritius at an hour's notice. His request, though delayed, was granted, and his return to that island preceded by an additional military force. The feelings, however, originally excited against him did not easily subside, and his residence there, which terminated in 1836, was embittered by a series of painful events arising from the fever advocacy of his opinions. Within three years, to use his own words, he had traversed fifty thousand miles, encountered the assassin on the shore and the penknife in the reading-room, in the service of the crown every peril to which life is subject, whether from the ocean, from climate, or from the hand of man.

In the year 1836, he was appointed to the office of judge of the Supreme Court of Ceylon, and during the same year he received a gratifying proof that his devoted zeal in behalf of emancipation had been fully estimated by the British public. A valuable piece of plate was presented to him by the Anti-Slavery Society; the inscription upon it testifying that 'by his disinterested, able, and energetic exertions in most critical and painful situations, both at home and abroad, negro freedom had been largely advanced, and the negro character raised to its just standard in public estimation.'

His residence during four years at Ceylon was the only tranquil period of his eventful life. Early in the year 1840, he stated in his pamphlet 'Civilization,' addressed to Sir J. F. Burton, 'It is the description and shows, what he considers will be the future effects of emancipation in the colonies, and gives a short outline of the progress of the sciences, and advance the civilization of Western Africa. He looks upon the emigration of the emancipated negro of the West Indies to the land of his origin as one of the most likely means of advancement.'

He says, 'we must look for the regeneration of Africa. To a reflex of the west upon the east, in moderate numbers, and managed with caution, must we look for the civilization of the east.'

It was to carry into effect the measures which had been suggested for ameliorating the condition of the liberated slaves that, undeterred by the perils of a pestilential climate, he accepted, in October, 1840, the important office of Governor and Commander-in-Chief of Sierra Leone, a colony of great value, and on the same day received the honour of knighthood. On the 23rd of April, 1841, only four months after his arrival and the Sierra Leone, a colony of great value, and on the same day received the honour of knighthood. On the 23rd of April, 1841, only four months after his arrival and the
altar-piece of the church of Bostraente, and was buried in that town, but his body was removed to Valencia and deposited in the church of Santa Cruz in 1581.

Joanes was one of the best of the Spanish painters; he is acknowledged head of the school of Valencia, and sometimes termed the Spanish Raphael. His drawing is correct, and displays many successful examples of foreshortening; his drapery is well cast, his colouring is sombre (he was particularly fond of mulberry colour), and his expression is mostly in perfect accordance with his subject, which is generally devotion or impassioned resignition, as in the Baptism of Christ in the cathedral of Valencia. Joanes' subjects are exclusively religious and if, as Cean Bermudez, Manuel de Arce, and on this account deserved the title of El Divino, Joanes is equally entitled to it. Like his countryman Vargas and D`Amato of Naples, he is said to have always taken the sacred before he commenced an altar-piece. His best works are in the cathedral of Valencia, and there are several good specimens in the Prado at Madrid. To mention a minor quality of his works, he excelled in painting hair.

Joanes had many scholars, among whom his son Juan Vicente was not distinguished: his daughters also, Dorotea and Margarita, were well known for their ability in painting. (Cean Bermudez, Diccionario Histórico, &c.)

EHL, the name of two celebrated engravers of Antwerp, father and son.

The elder, the son of Gerardo de Jode, likewise an engraver, was born in 1570. He was the pupil of Goltzius, studied in Italy and at Paris, and died at Antwerp in 1634.

De Jode engraved many plates in a good style, among them the remarkable picture The Last Judgment, by Correggio, which belonged to Charles I., Mercury instructing Cupid, which is now in the National Gallery. Scarcely anything is known of him personally: as an engraver he was inferior to his father and grandfather.

(Cabinet-Monument des Gravures; Hubert, Manuel des Amateurs, &c.)

JOHN, KING OF SWEDEN. [Charles XIV.]

JOHNSTON, DR. ARTHUR, the fifth son of an ancient family possessing estates in Aberdeenshire, was born in that county in 1587. At an early age he went abroad for medical education, and the degree of Doctor in Medicina was conferred on him at Padua in 1610. He travelled in various parts of the continent, and resided for twenty years in France, marrying twice in the course of that period. He returned to his native country before the year 1636, and was soon afterwards appointed physician to King Charles I., probably through the influence of Laud. After this appointment he must have resided chiefly in the neighbourhood of the court. In 1641 he died at Oxford, while on a visit to a daughter married there. Johnston's name is preserved in the memory of scholars by his Latin verses. He was the most extensive contributor, and is not usually called the editor, of Sir John Scott's collection of Latin poems, the Deltitiae Poetarum Scotiae (hujus Eur̦ Illustrium, Amsterdam, 1677, 2 vols. 12mo.; and besides several other volumes of compositions in Latin verse, he was bold enough to measure lances with Bevanan in a version of the Psalms, in Paradisi Poetica Scotiae, Amsterdam, 1637, 8vo. This ambitious attempt led, many years afterwards, to a protracted controversy on the merits of the rival versions; but the dispute is related, and Johnston's works fully described in Dr. Irving's Lives of Scottish Writers, 1859, 2 vols. 8vo.

It is enough here to say, that Johnston's high rank among modern writers of Latin poetry is universally admitted; and that, although in Scotland his psalms have usually been estimated much below Buchanan's, the justice of this sentence has been questioned by critics of authority, of whom Mr. Hallam is one (Introduction to Johnson's Works, and An Account of the Society, 1832). This is due to the fact that these few pieces of wood together for the interior fittings of buildings, for making articles of furniture, and for numerous purposes requiring greater neatness of workmanship than the operations of the carpenter. [Carpenter, P. C. S., p. 309.] The carpentry and joinery are in many instances combined in the same establishment, and even by the same workmen, it would be difficult accurately to define the limits of these two kindred arts at a good general definition is drawn between them in Tredgold's article 'Joinery,' in the seventh edition of the 'Encyclopaedia Britannica,' where it is stated that the art of carpentry is directed almost wholly to the support of weight or pressure, owing to which circumstance its leading principles belong to the mechanical sciences. The proper object of carpenter's work in a building is to give firmness and stability to the structure; and within its proper range may be embraced all the rough timber-work necessary for the support, division, or connection of the several parts of a building. Carpentry thus includes the construction of the framing of doors, partitions, and roofs. Joinery, according to the same authority, has for its object the fixed work-work necessary for convenience or ornament; and while it does not call for the application of much mechanical science, it requires, as Tredgold observes, much skill in the tools that depend upon the geometrical and trigonometrical projection and description of lines, surfaces, and solids, as well as an intimate knowledge of the structure and properties of wood. The principal items of joiner's work in a building, as enumerated by this author, are doors, windows, roofs, and the 'Encyclopaedia Metropolitana,' are the doors, windows, margins round plasters to protect it from injury at angles, &c.; decorations generally, such as architraves, base, columns, and pilasters; doors, thresholds, &c.; and in the projection of staircases, &c. decorations generally, such as architraves, base, columns, and pilasters; doors, thresholds, &c.; and in the projection of staircases, &c.

The construction of staircases [Staircase, P. C., p. 428], are considered as falling into the department of the joiner rather than that of the cabinet-maker, and the hand-railing of staircases is a department of joinery which requires much ingenuity, and is treated at great length in many works on the subject. Tredgold observes that cabinet-making, or that department of wood-work which relates to the making of furniture, has little affinity with joinery, although the same materials and tools are employed in both descriptions of work. The line of demarcation, however, between joinery and cabinet-making would seem to be even more difficult to define than that between carpentry and joinery; and, with the exception of such matters as veneering and polishing, which relate only to the use of the harder and more valuable woods, the operations of the cabinet-maker and the joiner are nearly identical, the same means being adopted by both for the production of neat and strong joints, and for erasing the injurious effect of shrinkage, warping, and the geometrical direction of the material. Indeed, Tredgold, indeed, remarked by the author of 'The Joiner and Cabinet-Maker,' in Knight's series of Industrial Guide-Books, that 'the same man will call himself a joiner when he is working in deal, or oak, or ash, and making a strong kitchen table, or a door, or a corn- chest, and a cabinet-maker when he is working in mahogany or rose-wood, and making a dressing-desk or a cabinet.'

Tredgold, in the article above referred to, has collected numerous notices relative to the progressive improvement of the art of joinery, and the principal works which have been published on the subject. He traces the origin of the art in the thrones, stools, pulpits, and screens of cathedrals and churches, in which, however, the joinery is of the most simple kind, and is indebted to the cutter for its ornament. The earliest writer on joinery to whom he alludes is John Mowbray, in whose 'Mechanick Experiments, 1677, the tools and ordinary operations of the joiner, and the technical terms then in use, are explained. He attributes the credit of establishing the principles of joinery, in this country, or in Scotland, to Peter Nicholson, whose valuable practical works of the late Peter Nicholson, who appears to have been the first English writer on the subject who derived assistance from the works of continental writers, who have previously produced valuable works on joinery, which show that some things given as new by English writers have long been known on the continent; but Tredgold observes that in
practice the French joiners are very inferior to our own. 'Their work,' he says, 'is rough, slovenly, and often clumsy, and has an air that betrays nearly as much nervousness, soundness, and accuracy which is so common to every part of the works of an English joiner, is scarcely to be found in the works of a French one.' 'The little correspondence,' he adds, 'that has hitherto passed between the two countries, leads us to think that their theoretical knowledge is inferior to that of the French, and that they are really much behind in their art.'

In this respect, the French are much behind in their art. The French joinery is not so well executed as that of the English, and the French carpenters are not so skilled in their work as the English. The French joiners are not so attentive to detail and are not so careful in their work.

This subject is briefly noticed under Carpentry, P. C. S., p. 229, and some information bearing upon it is given in Entomo, P. C. S., p. 120, an explanation, illustrated by sectional diagrams, of the manner in which wooly matter is formed, and of the arrangement of the component parts of the trunk of a tree.

Redgold gives much information relative to various kinds of wood in his 'Elementary Principles of Carpentry,' and, in his treatise on joinery in the 'Encyclopedia Britannica,' he gives the results of some important experiments on those peculiar properties of wood which lead to its warping and cracking. Of these the first in order was made by J. A. Knight, Esq., and published by him in 1801 and 1817; and they appear to be opposed to some general observations made on the subject in the same year. This subject is very important, as it has been the subject of much attention in the last century, and is one of the principal causes of the decay of old buildings.

In his 'Elementary Principles of Carpentry,' and in his 'Encyclopedia Britannica,' he gives the results of some important experiments on those peculiar properties of wood which lead to its warping and cracking. Of these the first in order was made by J. A. Knight, Esq., and published by him in 1801 and 1817; and they appear to be opposed to some general observations made on the subject in the same year. This subject is very important, as it has been the subject of much attention in the last century, and is one of the principal causes of the decay of old buildings.

The following is an account of an experiment made by J. A. Knight, Esq., and published in 1801 and 1817, which appears to be opposed to some general observations made on the subject in the same year.

Knight observes that 'there is a certain ratio of water absorbed in the grain of certain woods, which is independent of the size of the wood, and is the same in all cases of the same kind of wood, and depends on the kind of wood and the state of the tree at the time of its growth.'

'In this respect,' he says, 'the French joiners are much behind in their art. The French joinery is not so well executed as that of the English, and the French carpenters are not so skilled in their work. The French joiners are not so attentive to detail and are not so careful in their work.'

as possible from knots, and sawing them longitudinally into pieces four inches or four inches and a half wide. These are glued together side by side, an edge which has been nearest the heart of the tree being joined to an outside edge. When the glue is thoroughly set, the wide compound board thus produced is again cut up into slips, by sawing it longitudinally midway between the joints, and these slips are rejoined, with a further change in the order of placing the pieces. The grain of the joints is thus not more than two inches wide, so arranged as mutually to counteract any inclination to warping. A due regard to the laws of warping and shrinkage is also very necessary in the construction of large pieces which are to be built up, as, of several distinct pieces of wood. In making wooden columns, for example, several pieces must be fitted together to form a hollow cylinder, in preference to using one large post; or, where large posts are used, they must, if appearance is to be regarded, be surrounded by a number of narrow pieces. Small columns may be made of a single piece, and prevented from splitting by boring a large hole down their axis.

The original shrinkage of wood in drying is not however the only change of dimension to be provided for, since, from its hygroscopic properties, changes in the state of the atmosphere occasion even old and seasoned wood to vary in size from time to time. Of this we have a familiar illustration in the fact that doors, especially garden doors, which open and shut with facility in dry weather, frequently swell so as to become unopenable in a humid state of the atmosphere. From experiments made by M. Roudetel, quoted by Tredgold, it appears that in wood of a mean degree of dryness the extent of contraction and expansion produced by the usual changes in the state of the atmosphere was, in fir-wood, from 1/4th to 1/4th part of its width, and in oak, from 1/4th to 1/4th part of its width, showing a mean variation equal to 1/4th part of the width in fir, and 1/4th part of the width in oak. At this mean rate of variation the difference of width produced by the above cause alone in a fir board about 12 inches wide would be 1/4th of an inch, an amount abundantly sufficient to cause the board to split or crack, if it were fixed immovably at both edges.

For the above reasons it is always necessary to insert pannels in the framework in which they are mounted, in such a manner as to allow free motion at one or both edges. An ordinary framed door, such as that represented under Door, P. C., p. 86, affords a good example of panelled work, and one in which this peculiarity may be readily observed. In this kind of door the stiles, marked 2, 2, in the cut referred to, the rails, marked 5, 6, and the muntins (or, as they are frequently called by workmen, the muntins), marked 6, 6, 6, constitute a strong framing of thick but comparatively narrow pieces of wood, the rectangular openings of which, marked 1, 1, 1, 1, and 3, 3, 3, 3, are filled with pannels. These pannels are made to fit with sufficient accuracy to prevent shaking or rattling, yet not so tight as to prevent their sliding a little in the grooves, as the pannels shrink or expand. The usual practice is to fit them just so tight that a little force applied to the edge of the pannel with the palm of the hand, is sufficient to drive it into its place. In new houses it may often be perceived, by the appearance of the paint towards the sides, or rather edges, of the panels of doors and window-sash-frames, that, even when not more than nine or ten inches wide, they have shrunk at least one-eighth of an inch since the completion of the painting; nothing was taken to account them previously, and if observations were made with sufficient accuracy, it would be found that the amount of shrinkage appears to be greater or less according to the state of the atmosphere. The addition then to the glue or solar heat, and the difference of outside and inside of pieces occasioned the pannels to crack or split, which they occasionally do with a noise sufficiently indicative of the irresistible force with which the change of dimension takes place. In superior doors the gluing is thoroughly set, the wide compound board thus produced is again cut up into slips, by sawing it longitudinally midway between the joints, and these slips are rejoined, with a further change in the order of placing the pieces. The grain of the joints is thus not more than two inches wide, so arranged as mutually to counteract any inclination to warping. A due regard to the laws of warping and shrinkage is also very necessary in the construction of large pieces which are to be built up, as, of several distinct pieces of wood. In making wooden columns, for example, several pieces must be fitted together to form a hollow cylinder, in preference to using one large post; or, where large posts are used, they must, if appearance is to be regarded, be surrounded by a number of narrow pieces. Small columns may be made of a single piece, and prevented from splitting by boring a large hole down their axis.

The original shrinkage of wood in drying is not however the only change of dimension to be provided for, since, from its hygroscopic properties, changes in the state of the atmosphere occasion even old and seasoned wood to vary in size from time to time. Of this we have a familiar illustration in the fact that doors, especially garden doors, which open and shut with facility in dry weather, frequently swell so as to become unopenable in a humid state of the atmosphere. From experiments made by M. Roudetel, quoted by Tredgold, it appears that in wood of a mean degree of dryness the extent of contraction and expansion produced by the usual changes in the state of the atmosphere was, in fir-wood, from 1/4th to 1/4th part of its width, and in oak, from 1/4th to 1/4th part of its width, showing a mean variation equal to 1/4th part of the width in fir, and 1/4th part of the width in oak. At this mean rate of variation the difference of width produced by the above cause alone in a fir board about 12 inches wide would be 1/4th of an inch, an amount abundantly sufficient to cause the board to split or crack, if it were fixed immovably at both edges.

For the above reasons it is always necessary to insert pannels in the framework in which they are mounted, in such a manner as to allow free motion at one or both edges. An ordinary framed door, such as that represented under Door, P. C., p. 86, affords a good example of panelled work, and one in which this peculiarity may be readily observed. In this kind of door the stiles, marked 2, 2, in the cut referred to, the rails, marked 5, 6, and the muntins (or, as they are frequently called by workmen, the muntins), marked 6, 6, 6, constitute a strong framing of thick but comparatively narrow pieces of wood, the rectangular openings of which, marked 1, 1, 1, and 3, 3, 3, 3, are filled with pannels. These pannels are made to fit with sufficient accuracy to prevent shaking or rattling, yet not so tight as to prevent their sliding a little in the grooves, as the pannels shrink or expand. The usual practice is to fit them just so tight that a little force applied to the edge of the pannel with the palm of the hand, is sufficient to drive it into its place. In new houses it may often be perceived, by the appearance of the paint towards the sides, or rather edges, of the panels of doors and window-sash-frames, that, even when not more than nine or ten inches wide, they have shrunk at least one-eighth of an inch since the completion of the painting; nothing was taken to account them previously, and if observations were made with sufficient accuracy, it would be found that the amount of shrinkage appears to be greater or less according to the state of the atmosphere. The addition then to the glue or solar heat, and the difference of outside and inside of pieces occasioned the pannels to crack or split, which they occasionally do with a noise sufficiently indicative of the irresistible force with which the change of dimension takes place. In superior doors the gluing is thoroughly set, the wide compound board thus produced is again cut up into slips, by sawing it longitudinally midway between the joints, and these slips are rejoined, with a further change in the order of placing the pieces. The grain of the joints is thus not more than two inches wide, so arranged as mutually to counteract any inclination to warping. A due regard to the laws of warping and shrinkage is also very necessary in the construction of large pieces which are to be built up, as, of several distinct pieces of wood. In making wooden columns, for example, several pieces must be fitted together to form a hollow cylinder, in preference to using one large post; or, where large posts are used, they must, if appearance is to be regarded, be surrounded by a number of narrow pieces. Small columns may be made of a single piece, and prevented from splitting by boring a large hole down their axis.

The appearance of such boarding may be improved by forming a head with a moulding-plane along one edge of each board on the visible side, as at b, b, Fig. 2, because by that means the open joint is in some degree masked by the quirk or wide groove on the opposite side of the boarding. The same means of avoiding the disagreeable appearance of the opening joint is adopted in some doors and shutters which are framed and panelled in the usual manner, but in which the pannels are made two-thirds instead of one-third of the thickness of the framing, the muntins being suitably cut to correspond with the thickness of an ordinary pannel, and the relaoted portion alone is inserted in the grooves of the framing, while the uncovered portion of the pannel is brought flush or even with the surface of the framing. This mode of construction is often adopted for external doors, as it allows them to be made strong without any great thickness of framing. At c, c, Fig. 2, is shown another mode of joining boards side by side, which is called match-boarding, and is applicable to timber or stuff of or exceeding half an inch in thickness. This plan is frequently adopted for the kind of inferior doors called ledged doors, which, to avoid the expense of framing, are made of narrow boards placed side by side, and held together by transverse pieces called ledges or battens, to which each of the boards is nailed. The joint, as shown in the cut, where it is represented taken away a head, consists of a groove cut in the edge of one board, receiving a projecting tongue formed on the edge of the adjoining one. Planes called match-planes, made in pairs, one for forming the groove and the other for forming the tongue are made to facilitate the fitting of match-boarding; but when the joiner does not possess these the groove may be formed with the kind of grooving-plane called a plough, and the tongue by cutting away each side with a rebate-plane, which is more commonly, though incorrectly, termed a rabbit-plane. Similar to this kind of joint is that called ploughing and tongueing, in which both edges of every board are grooved, and a separate strip of wood is inserted between them to fill the spaces. This plan, which involves no waste of material, is often employed in floors.

As indicated by its name, a very important department of the art of joinery is the formation of strong and accurate
The joints hitherto noticed are not intended so much for holding together the pieces of wood united by them, that object being effected by the screws or other fastenings. In the case of a framed door or piece of panelling, and by the ledges and cross-pieces in the case of a ledged door, as at 3, for example, in the case of changes of dimension; but we have yet to notice such as are intended for the several parts of a framing or other construction. On this branch of the art Tredgold well observes that while in carpentry framers owe their strength principally to the form and position of several members, the union of the timbers in works of joinery depends wholly upon the joints.

The simplest mode of uniting two pieces of wood is to cut the end of one piece and fit each other, separately, and to cement them together with glue. [Gane, P. C., p. 278.]

When the glue is good and properly applied a glued joint is surprisingly strong—stronger indeed, in some cases, than the wood itself; if, for example, two boards be glued edge to edge, as for forming a panel, the wood will break, if sufficient force be applied, without the joint giving way. In forming such a joint the adjoining edges must be planed perfectly straight and smooth, which may be readily done by the use of the flat contrivance called a "shooting-board," which is a flat board with a perfectly straight edge, and with a cross-piece fitted on near one end at right angles with that edge. This board being laid on the bench, the laid of the glue is daubed upon it, with its end against the cross-piece or stop, and the plane, which is laid on its side on the bench, is rapidly slid or shot along, being guided by the edge of the shooting-board, and forcing a space for the glue to pass, the glue thus made true, is smeared with hot glue, and one is rubbed backwards and forwards a few times over the other, to distribute the fluid glue equally, to force it into the pores of the wood, and to exclude any air which might be present, and to make the joint close. This done, the boards should be set aside until the glue is perfectly set. To prevent the possibility of any strain which might tend to open the joint while the glue is soft, it is well In some cases to fix the edges together with wooden wedges, so that the weight of the uppermost piece may tend to keep the joint close.

In many other kinds of joint the hold of glue is less perfect in consequence of the impossibility of applying the rubbing-down necessary for the purpose above mentioned; and in such cases it is necessary to secure the parts united by it in their places by screwing the articles up in an iron cramp, by weighting, or by wedging. From a carefully conducted experiment by Mr. E. Bevan, of which, as well as of his experiments on nails, which are referred to below, an account is given in the article "Adhesion" in Herbart's "Engineer's and Mechanic's Encyclopedia," apparently on the authority of the 'Mechanics' Magazine,' it appears that the adhesion of glue, under favourable circumstances, is equal to a force of at least 715 lbs. per square inch. In the experiment referred to a force of 1,200 lbs., applied gradually, was necessary to separate two cylinders of dry ash-wood, the ends of which presented a surface equal to 176 square inch, and which were glued and placed in a vertical position, in order to get a clean surface of the joint.

Even this weight was sustained for two or three minutes before the joint gave way; and it was found, on examining the separated surfaces, that the glue was very thin, and had not entirely covered the surface. The cohesive strength of the glue appears therefore in this experiment to have been rather more that 715 lbs. per square inch, while the cohesive strength of the wood thus united, in a lateral direction, was found to be only 569 lbs., thus showing that, if the joint had been between the sides instead of the ends of the pieces of wood, the wood would have given way before the glue. In this case, however, the glue was newly made, and the test was performed in the height of the winter season, with glue which had been frequently made, with occasional additions of glue and water, the cohesive force indicated was only from 320 lbs. to 500 lbs. per square inch. When the glue is made in winter, and has been kept in store made in the winter season, with glue which had been frequently made, with occasional additions of glue and water, the cohesive force indicated was only from 320 lbs. to 500 lbs. per square inch, from which it may be inferred that its application as a cement is capable of such improvement as to show a more adhesive property. In this respect the adhesive is much superior to that of gums.

Glue that has been made a long time and kept in store is found to possess greater tenacity than newly-made glue; and for the use of the joint a pale-coloured glue is preferred, by using the same glue in making the joint a little more adhesive and warping. The appearance of such a joint may be in some measure improved by the introduction of a small bead on the shutting piece, as at b, Fig. 3, or, by converting the whole of the joint into a little bead, as at c, Fig. 5, a plan which is often adopted, with very good effect, in the interior fittings of a house. The kind of joint marked A, of which a detailed description is given, is nearer than the simple joint a, as the end of the glue is nowhere exposed to view, and it allows nailing in both directions; but it is not so secure, and, owing to the
tendency of the inclined faces to slip upon each other, it is difficult to form it with accuracy. It is the joint used for the angles of picture-frames, and for many other purposes in which the joint is exposed to view in the same manner; and in such cases the strength of the joint is often increased by inserting, in a saw-cut made for the purpose in a sloping direction, a thin slip or key of hard wood in the direction indicated by the dotted lines. This key is inserted with glue, and when that is dry, the superficial corners are cut off. At e, Fig. 3, is shown a mitred joint at an obtuse angle, to show that this form of joint is applicable to any angle, the planes of the joint being in all cases made to bisect the angle. To facilitate the accurate formation of mitred joints, joiners employ a contrivance called a mitre-box, by which they are enabled to saw and planes, or chisel, the inclined faces exactly to the required angle. The last joint represented in Fig. 3, that marked f, is a combination of the overlapping with the mitred joint, much nearer, where the angle alone is visible, than the former, and stronger in the latter, like wood, may be nailed both ways. Fig. 4 illustrates an arrangement almost too simple to need explanation, by which the strength of a mitred joint of the over-lap kind may, with less trouble, result in a great increase. Simple as it is, however, it is very rarely practiced in this country, and, indeed, has never been seen by the writer excepting in tobacco-chests or packing-cases from America. For nearer purposes it might be worth while to divide each joint into four or more portions, instead of two only, as in the cut, but which means the tendency of the joint to open by the warping of the wood, or in consequence of external violence, would be still further resisted, owing to the more frequent changes in the direction of the nails.

In all the angular joints above noticed, the two pieces of wood which form the members of the joint are held together by the glue, nails, or screws applied to connect them; but in the higher operations of the joiner and cabinet maker, the wood is so cut as in some degree to hold the construction together independently of such aid. In the joints shown in Fig. 5, for example, where a represents a joint adapted for external angles, and b a joint for internal angles, such as those of the skirtings of a room, the form of the joint alone would hold it together, irrespective of any fastenings. The same rate of the parts, aided by the glue, and in some cases by nails or screws, renders the joint so strong even in that direction that, if properly made, the wood will sooner break than separate at the joint. The small dovetail-shaped projections in the piece a are called pins, and the openings cut in the end of b to receive them, holes. When the boards which constitute the members of a long dovetailed joint are composed of two or more pieces glued together at the edges, it is well so to arrange the dovetailing that the glued joint, if in the piece corresponding with in the cut, shall fall in one of the pins, and not in a groove between them, and if in the piece in one of the intervening solid spaces between the holes, and not in the hole itself; because by such an arrangement the driving up of the dovetail tends to hold the glued joint together, while it might otherwise tend to split it open. In connecting the front of a drawer with its sides, it is desirable to conceal the joint entirely on the front face. This is done by the kind of joint shown in Fig. 7, which is termed a dovetail blind of one eye.

In it the piece forming the front of the drawer is made thicker than the side, and the pins, which are formed on the front piece, are made only as large as if were of the same thickness as the side, and the intervening spaces are not cut through the extra thickness of the wood. Similar to this is the dovetail blind of both eyes, or mitred dovetail, in which both pieces are of equal thickness, and the pin-holes, as well as the pins, are stopped about one-eighth or three-sixteenths of an inch from the outer or visible surface of the wood, the extra thickness of the wood thus left uncut being mitred; so that the joint is invisible on both sides, but the means by which it is rendered so is completely invisible. Such a joint of course requires very accurate workmanship, to enable all the parts to fit closely without being so tight in any part as to need injurious force in knocking it into its proper position.

The only other kind of joint that claims notice here is the mortise and tenon, which is the kind of joint usually employed for connecting the several members of the framing of a door or similar piece of panelled work, as well as for many other purposes. A mortise is a deep and narrow groove cut in one member of the framing to receive a corresponding projection called a tenon, or, improperly, a tenon, formed on the end of another member of the framing which abuts upon it, usually at right angles. Tredgold recommends that the thickness of a tenon, and consequently the width of the mortise to receive it, should be about one-fourth of the thickness of the framing, and that the width of the tenon should never be greater than five times its thickness. A more general rule, however, is to make the tenon one-third the thickness of that part of the framing which it is to enter. When the members of the framing are wide, the tenon is divided by an intervening space into two parts, by which the necessity for weakening the frame by very long mortises is avoided. In Fig. 8, a represents a divided tenon of this kind, and b what is termed a double tenon, which is sometimes used in very thick framing, especially in the framing of doors which are to receive mortise locks, or locks inserted in the thickness of the door, in which case the neck is placed in the interval between the two tenons. In some cases, where a single tenon is used in thick framing, a small projection called a cross or feather-tenon is formed on each side of it like a very short tenon, as in c, Fig. 8 shallow grooves or mortises being cut on each side of the principal mortise to receive them.
Clamping is an expedient resorted to by the joiner when he wishes to secure a broad board, whether formed of a single piece, or of two or more glued together at their edges (in such case, if the wood be thick, dorels, or pins inserted halfway into each of the adjoining pieces, may be used to aid the glue), from liability to warping. It consists in fitting on to each end a transverse piece, as at d, Fig. 8, the grain of which runs at right angles with that of the board. The connection between the board and the clamps is effected by a tongue formed on the end of the board, visible at the edge in the cut, and entering a groove ploughed in the edge of the clamp. In addition to this tongue, which extends across the whole width of the board, two or three tenons, which may or may not pass completely through to the external edge of the clamp, are frequently formed on the end of the board, in which case the joint is termed a mortise clamp; and in some cases where special neatness is required the ends of the clamps are mitered into the board, as at e, Fig. 8, which is called a mitre clamp, and in which both the tongue and the tenons, if any, are used, may be made invisible. Where it is necessary to curve boards by softening them, by boiling or steaming, and forcing them into the required shape (in which they are retained by gluing blocks underneath them and by other means upon a saddle or mould), Tredgold observes that the process may be improved by saturating the convex side, while the wood is still confined to the mould, with strong glue, which may dry and harden in the extended pores, and thereby tend to keep the wood in the required shape when it is removed from the mould.

The plan of this article does not admit of more than a passing reference to the large subject of geometry as applied to the joiner's art; a subject which is treated at length in the practical treatises of Nicholson and Tredgold; nor does it allow of any detailed explanation of the modes of executing the various departments of his work, which, together with a full account of the tools employed, may be found in Nicholson's 'Architectural Dictionary.' The tract entitled 'The Joiner and Cabinet-maker,' alluded to near the commencement of this article, will be found an admirable preparative for more extensive works: explaining, as it does by a few familiar examples, in terms easy to be understood, most of the ordinary operations of the joiner, and some of those of the cabinet-maker. Of some of the principal tools used in joinery accounts are given under Saw, P. C., p. 476; Boring Instruments, P. C. S., p. 225; and Bevel, P. C. S., p. 192. Of the other tools commonly employed, planes, of which a great number adapted for different uses are required, are the most important. An ordinary plane may be described as a broad and very sharp chisel mounted in a large block of wood in such a manner that it is always kept at a certain angle (varying according to the purpose to which it is to be applied, but commonly about 45°) with the face of the stock, which, by sliding along the board to which the plane is applied, keeps the blade always in the right position for cutting, and prevents it from digging too deep into the wood. The weight and size of the stock also enable the workman to apply the tool with greater effect and steadiness than he could a chisel held in the hand. The degree of projection of the blade from the face of the plane is capable of regulation, and the blade is held in its required position, by a wedge, which may be inserted and the blade caused to rise a little into the stock in case it should become too prominent, or technically, too proud, by striking the stock or other end of it against a hammer, or by striking it like manner on the upper surface of the front end of the stock. In planing a board to a smooth surface the workman commonly uses three planes: first, a course one, which takes off thick shavings, called a jack-plane; then one adapted for taking very thin shavings and having a very long stock, called a try-square plane. The author of the 'Joiner and Cabinet-maker' thinks that this name means true- ing plane: the object of the instrument being to make the surface perfectly flat or even; but the ordinary use is still more applicable, since the workman in using this plane is continually trying where, by any undue prominence in the wood, he can take off a shaving; the length and straightness of the stock, with the angle of the blade which he frequently tests his work with a straight-edge, prevent the plane from biting or cutting where the board is hollow. So soon as the workman finds that he can take a continuous shaving off the whole length of the board with the try-plane he knows that the surface is rendered sufficiently flat. The third plane used for ordinary work is a small short-stocked plane, called a smoothing plane, adapted for application in various directions to parts in which the grain may run irregularly, and for planing up small parts of the work for which the other planes are unsuitable owing to their large size. For such operations as rebateing, grooving, or ploughing, and cutting beads and mouldings, other kinds of planes are used, in which both the cutting edges of the blades and the faces of the stocks are so formed as to be exact counterparts of the shape of the rebate, groove, bead or moulding required. In many planes of this character, which have an immense variety of work, besides requiring the joiner to perform work which even a skilful carpenter could not do so well by hand in ten times the time required with the use of the plane, the blade or iron is so fixed as to cross the face of the stock obliquely, that it may the better clear itself of shavings. In planing a piece of deal or any similar soft wood, it is necessary to avoid meeting the grain, which would cause the plane to stick fast; and when this inconvenience is felt it may almost always be avoided by turning the wood, and planing in the opposite direction. In planing mahogany or some other hard woods, it is more difficult to avoid meeting the grain, as it is often be found running one way in one part of the board and another way in another. To remedy this inconvenience, observes the author of 'The Joiner and Cabinet-maker,' 'the cabinet-makers' planes are made of a double iron: that is, an iron with a flat dull edge is screwed on the face of the cutting-iron so as to prevent the shavings chipping up against the grain.' The more cross-grained the wood is, he adds, 'the closer does the cabinet-maker bring down the dull iron towards the edge of the sharp one, and the finer are his shavings in consequence. The joiner's trying-plane and smoothing-plane, if not his jack also, are likewise turned with the grain, and, besides being used for cross- and grain-wound woods; but when he is planing straight-grained deal, he keeps the dull iron at a good distance, perhaps an eighth of an inch, from the cutting edge, so that the shaving comes off without touching it. To fit the blades of these plane are made of a steeper or more upright pitch than those of the joiner; and among the planes peculiar to his business is the tooling-plane, which has a nearly vertical blade with a notchted or scarred edge, produced by burnes on the face of the iron. It is used principally for roughening the surfaces of veneers and of the wood upon which they are laid, to give a better hold to the glue.

Of turning, which, though a totally distinct occupation is an essential adjunct to the art of cabinet-making, an account is given under Turning, P. C., p. 418; and veneering, which is an important branch of the cabinet-maker's business, is briefly noticed under Veneering, P. C., p. 206. The last-mentioned process, as applied to the large surface of the top of a chest of drawers, is minutely described in the 'Joiner and Cabinet-maker,' in which work, as well as in the fourth volume of Dodd's British Malting, the author of this work, having noticed the previous column, details are also given respecting polishing with linseed oil (called furniture oil, when coloured dark to match the mahogany, to which it imparts a darker hue); beeswax and turpentine, especially French, but often pitch is used instead of wax. A little paraffin oil is usually made of gum-shells, gum-seedleaves, and Venice turpentine, mixed in various proportions and dissolved in spirits of wine; but as these mattes do not adhere well to the art of joinery, an incidental reference in this place is sufficient.

JONES, JOHN, Ll.D., was born in the parish of Llandinam, in Caermarthenshire, where his father was a farmer. He was educated at a grammar-school at Brecon, and afterwards became a student at the Univerity New Col...

JOU

by Hackney, where he was a famous pupil of Gilbert Wakefield.

In 1792 Mr. Jones was appointed classical and mathematical teacher in the Welsh Academy, Swansea, which situation he held about three years, and then settled at Fympor, near the town of the Unitarian congregation in a place, where he remained two years. He then became minister of the Unitarian congregation at Halifax in Yorkshire. In about three years he removed to London, where he resided during the major part of his life, chiefly occupied as classical teacher, and preaching only occasionally in the places of others: he never took charge of a congregation. Soon after he married the daughter of Dr. Abraham Rees; she died without issue in 1818. In 1817 he married again, and had two children, who survived him. He died January 10, 1827, in Great Conna Street, London, and was interred in the burying-ground of St. George's Bloombury. A few years before his death he received the diploma of LL.D. from the University of Aberdeen, and was soon afterwards elected a member of the Royal Society of Literature.

Dr. Jones was the author of several works, some of which are religious, chiefly in support or defence of the evidences of Christianity. Of these one of the most important was, "Illustrations of the Four Gospels," which has been frequently reprinted, the year before his death he removed to London, where he resided during the greater part of his life, chiefly occupied as classical teacher, and preaching only occasionally in the places of others: he never took charge of a congregation. Soon after he married the daughter of Dr. Abraham Rees; she died without issue in 1818. In 1817 he married again, and had two children, who survived him. He died January 10, 1827, in Great Conna Street, London, and was interred in the burying-ground of St. George's Bloombury. A few years before his death he received the diploma of LL.D. from the University of Aberdeen, and was soon afterwards elected a member of the Royal Society of Literature.

Dr. Jones's chief work, to which he devoted a great many years of his life, was his Greek and English Lexicon, which was published in 1835, in one volume, 8vo., and again in 1842. Dr. Jones was one of the first to introduce into this country the practice of teaching Greek through the medium of English instead of Latin; and the first Greek and English Lexicon for general use was Dr. Jones's. He afterwards published an enlarged edition for use of schools, "The Tyro's Greek and English Lexicon." There have since been several Greek and English Lexicons, not only in England, but in America. Soon after Dr. Jones's came out, Schrevelius's Lexicon was translated into English, and published by Valpy, a new edition of which came out in 1831. In 1836 Dr. Donoghue's Greek Lexicon appeared, and since those of Grove, Ewing, Dunbar and Barker, Hinkel's small School Lexicon, and lastly the Lexicon of Liddell and Scott, which is in one volume 4to., in small type, with many thousands of references, and has already (1858) passed through a second edition. It is based on the German work of Passow.

The success of Dr. Jones's Lexicon was very great, and a large impression was soon disposed of. The work, as might be expected, without its faults, was treated in the second number of the "Westminster Review." (Gent. Mag. 1827 : Journal of Education, vol. iii., 1823.)

Josquin, D'Arcy—Josquin, the eldest composer of the most ancient school of part-music —was, there seems little reason to doubt, a native of the Low Countries, though the honour of his birth is indirectly claimed by many Italian writers, whose date still remains a matter of importance; M. Fayolle thinks that the year 1450 may be assumed as the period at which he was born, and we are not inclined to differ from this opinion.

The portrait of Dr. Jones, Ockenheim, the eldest composer in parts on the continent," says Dr. Burney, "of whose works I have been able to find any remains," and much of whose reputation arises from having been the instructor of several celebrated scholars, is said to be related to each other as Blow and Purcell. On the monument of the former, in Westminster Abbey, it is recorded that he was master to the famous Mr. Purcell. It is probable that Dr. Jones was not inferior in the knowledge of his art; and this may have led to his having been thought a native of that country. Dr. Jones had a great many compositions, to which the frequent additions to which he was related, as that of Pratoni, or del Prato (a name very often used), may be attributed. It is certain that he was a singer in the pontifical chapel in the time of Sixtus IV., who sat in the papal chair from 1471 to 1494, for Adami speaks of him, in that capacity, in high terms, as well as of his compositions, calling him, "unomi insigne per l'invenzione." Quitting Italy, he went, according to Gessnerus, appointed Maître de Chapelle to Louis XII., for whom he composed much music (consisting of some amusing stories are told), and a motet or two or so contrivers were written at his request to be taken to the performance. Louis had made him a promise of a benefice, but neglected to redeem it. To remind the king the composer produced a motet beginning 'Messu est verit,' &c. This not proving very interesting, Josquin wrote another motet upon the words, 'Fortio men non est in terra viventium.' Louis then took the hint, bestowed a benefice, and the composer expiated his ingratitude in the observance of 'Bonitatem faciendi servae tuo, Domine.' But Gessnerus remarks that desire proved more inspiring than gratitude, for the two first works very much surpassed the last.

The time of Josquin's decease is not known. He was buried in the church of St. Gudule, at Brussels, where his effigy and epitaph are, we believe, still to be seen. He was a very voluminous composer, and many of his works remain to attest his learning and genius. He has given a splendid edition of them: Burney more than one example; and several are to be found in the British Museum. 'He may,' says Dr. Burney, 'be justly called the father of modern harmony, and the in- ventor of almost every ingenious device in composition; parts, nearly a hundred years before Palestrina, Orlando di Lasso, Tallis, or Bird, the great musical luminaries of the sixteenth century, whose names and works are still held in the highest estimation.' This great composer's style appears to me the true and genuine style of choral compositions.'

Jouvenet, Jean—Josquin—Josquin —Jouvenet, Jean, famed painter during the reign of Louis XIV., was born at Besançon, in 1644. He was first instructed by his father Laurent Jouvenet, but completed his studies in Paris, where he soon attracted the notice of Lebrun, who in 1764 procured him his election into the Academy of Painting. He was the first to introduce into France the style of Poussin, especially in the treatment of landscape, and was the author of one of the best paintings of the Academy collection. Jouvenet had obtained considerable distinction two years previously by his picture of the Lame Man healed, which was the celebrated "May Picture," and was kept in the Louvre, the Duc de Maine (1673). The May Picture was a painting which was formerly presented on the 1st of May of every year to the Virgin, in the cathedral of Notre Dame, by the Goldsmiths of Paris. The practice ceased in 1709. Jouvenet became successively professor, director, and perpetual rector of the Academy, and he was granted a small pension by Louis XIV. He died in 1717. The French boat of Jouvenet, as of Le Sueur, because he never visited Italy; and it is for the same reason, according to some, that he is censured by Count Algarotti, who, they say, had not seen an excellence in his work and was not interested in it. The works of Jouvenet are not brilliant in any respect or even attractive, yet they possess all the greater merits of a picture in more than an ordinary degree. His style resembles that of Nicolas Poussin, especially in composition and colour: and he excelled in light and shade, but in expression he was never great.

Jouvenet's last work, the Visitation of the Virgin, or The Magnificat, in the cathedral of Notre Dame, was painted with his left hand in 1717. He had a paralysis stroke in 1713 and lost the use of his right hand, but upon the first trial he found his left as obedient to his will as his right had been, and one of the many proofs that, in art, it is not the hand but the mind that requires the education.

There are ten of Jouvenet's pictures in the Louvre, some of which are his best works, as the Miraculous Draught of Fishes, and The Institution of Lazarus. Jouvenet, Jean, in the Church of St. John, and the Descent from the Cross. The first four have been worked in tapestry of the Gobelin, and they have all been engraven and sold to the public. There are other works, some of the best French engravings—by H. S. Thos- sain, J. Audran, E. Picard, L. Desplaces, A. Loir, A. Trovain, and others. There are works by Jouvenet, Jean, of the art of the modern age, and each picture of the Touron's mural paintings the principal are the colloidal frescoes of the Apostles painted on the dome of the church Des Invalides. (D'Argenville, Abrégé de la Vie des Peintres, t. i. 1752, p. 212. Art, &c.; Guiteau de Saint-Sever, Les Trois Siècles de la Peinture en France.) Jouvenet, Pierre, was born at Paris in 1643; he studied at Cassi and afterwards at La Flèche, with consider-
JUD 125  JUD

able success, and was at an early age admitted a member of the Society of the Jesuits. He devoted himself chiefly to history, and was the author of the fifth part of the History of the Jesuits from 1691 to 1616, which was published at Rome in 1710. Though an agreeable writer, from the purity and elegance of his style, his facts are not to be implicitly relied on. So bigoted a writer is not the man to write an apology of the Jesuit Guignard, who was executed in the reign of Henry IV. of France, on account of his participation in a rebellion against the life of that monarch by Jean Châtel, who had been arrested on the preposterous charge of having written an apology of the Jesuit Guignard. An abridgment of his history was published at Liege in 1716, which is now rarely to be met with. A translation of a portion of the collection of Latin Harangues, pronounced by him on different occasions; his Latinity, though it has been blamed by Vallart, is generally admired. 2. A treatise 'De Arte Doencet et Doecaret,' which is in some esteem, but considered too offici-}

JUDGE (from the French juge, which is from the Latin iudicis). [JUDIX, P. C.] A judge in England and Wales is a man who presides in a court duly constituted, declares the law as applied, and pronounces the sentence or judgment according to law. There are judges of the three Superior Courts of Law at Westminster, judges in the Courts of Equity, a judge in the Court of Bankruptcy, judges of the Inns of Court, judges in the Ecclesiastical and Admiralty Courts, and some others. Some judges are called Recorders, and there are other names, but the name does not alter the nature of the office. When the judges simply are spoken of, they are usually understood to mean judges of the common law. The number of judges of the common law is fixed at fifteen. There are judges of the common law in five courts: five in the Court of Queen's Bench, five in the Court of Common Pleas, and five in the Court of Exchequer. There are at present five judges in the Court of Common Pleas, five in the Court of King's Bench, and five in the Court of Common Pleas; and five in the Court of Exchequer. The judges of the superior courts of law are appointed by the crown. They hold their office during good behaviour, but they can be removed by the crown on the address of both houses of parliament (13 Geo. III. c. 33), they continue to hold their office during good behaviour notwithstanding any demise of the crown, and their salaries are secured to them so long as they hold their office. The judges of the courts of Equity are also appointed by the crown. [CHANCELLOR, P. C.; CRANBERRY, P. C.]

By various acts of Parliament retiring pensions of a determin-}
mate period are provided for the judges of the three courts of law, and to the judges in Equity. The lowest retiring pension is £5000, and this amount may be given to all or some judges of the three courts. The highest retiring pension is £4000, and is given to the chief judge of the crown to the lord chancellor upon his resignation. But to be entitled to these pensions all the judges of the superior courts of law, and the judges in Equity, except the lord chancellor, must have held the office of fifteen years, unless bad health has prevented them from holding office so long. Judges of Courts of Record (Courts, P. C.) are not liable to prosecution for anything done by them as judges, but they may be prosecuted in parliament. Nor are they liable to an action for any error in judgment or for wrongful imprisonment, at least when they are acting within their jurisdiction. Judges are punishable for bribery, by loss of office, fine, and imprisonment.

The powers and duties of judges would form the subject of an elaborate treatise. It may be sufficient to observe that in England judges are appointed to enforce the laws and to protect the discharge of their duty and so make their office, as to make them entirely independent of all political and private influence, and they are paid well enough to secure them against the charges of any misconduct in any judge of the superior courts of law, or any judge who holds a high office, is now seldom or never heard of. The only question that can be raised is, whether the members of that body, who, whatever be the character of their persons are not sometimes appointed who, though not abso-

of any estate whatsoever, at law or in equity, or over which he may have any disposing power. All judgments are made binding on the persons against whom they are entered up, and against all persons entitled under the judgment creditor being entitled to the same remedies in a court of equity as if the debtor had by writing agreed to charge the lands, &c. The creditor is not however to proceed in equity to obtain the remission of principal debt or interest within one year from the time of entering up such judgment; and in case of bankruptcy, the judgment, unless entered up one year, is to give no preference to the judgment creditor beyond creditors who are entitled to the same in the court of bankruptcy. As to purchasers, mortgagees, or creditors prior to the time when the act came into operation; and with respect to purchasers for valuable consideration without notice, the rules of equity remain unaltered.

A judgment creditor, applying now for remedy to the Court of Chancery, will not be obliged to sue out the writ of execution for that which is agreed to be done is considered by a Court of Equity as actually performed, and the judgment creditor has therefore, by virtue of his judgment alone, an equitable estate. If however a judgment creditor, having obtained any charge, or being entitled to the benefit of any security, should, before the property so charged or secured is conveyed into money and applied towards the payment of the judgment debt, cause the judgment debtor to be arrested, the benefits of the security could not be pronounced in his absence, but this has been altered by the 11 Geo. IV. § 1 Wm. IV. c. 70, which enacts that upon trials for felonies or misdemeanors judgment may be pronounced whether the person affected be present or absent, except only in cases of information filed in the Court of King's Bench, or in cases of information filed by the attorney-general where he prays that judgment may be postponed. The judgment of the court extends to the life and liberty of the offender according to punishment decreed to the offence against which the judgment is delivered. In some cases it extends to the compensation by forfeiture of the lands or goods, or both, of the offender; others induce a disability of holding offices or of sitting in the House of Commons, and a large proportion are merely pecuniary by stated or discretion ary fines.

On the subject of judgments see Chitty's General Practice; Stephen, On the Principles of Pleading in Civil Actions; Sugden's Vendors and Purchasers; Prideaux, On the Law of Judgments as they affect Real Property.

JUGGARNATH, TEMPLE OF GOD Hindustan, is situated in the province of Orissa and district of Cuttack, in 19°. 47' N. lat., 85° 59' E. long., about 45 miles south of the city of Cuttack, and 311 south-west from Calcutta, direct distances. The temple, which is named after the Hindu idol Juggarnath (properly Jagannatha, or lord of the world), placed within it, stands on the coast of the bay of Bengal, and is a huge architectural mass, a sort of pyramidal tower, 200 feet high, built of the most durable stone, and covered with rough coating of chunam. It stands in the centre of a quadrangle enclosed by a high stone-wall, each side of which is 650 feet long. It is a very conspicuous land-mark, and is of considerable importance to navigators on the Baltic and uniform coast where it is situated. The country, to the distance of about a mile from the sea, is a waste of deep loam sand; farther inland it consists of low sand-hills covered by a thick forest of dwarf trees. The quadrangular inclosure is laid out for the convenience of the Temple of Somnath, in Guzerat, which was destroyed by Mahmoon in the 11th century. All the authorities agree in stating that it was erected in the 12th century.

The festival of Jagannath takes place every year, and the number of pilgrims is still very great, though much less than formerly, when Dr. Carey estimated them at 1,200,000. Three idols, gigantic busts, hideously ugly, are placed on pedestals which are concealed among the doors, the surfaces of which are resorted to by the throngs assembled. The statue is placed on a lofty platform, which rests on sixteen wheels, each 66 feet in diameter; and it forms alongside a monstrous car, or rath, 43 feet high and 35 feet square. Cables are attached to the chariot, and by these the pilgrims drag a about a mile and a half to its destination, and then back again, the whole procession occupying three days. The principal idol is a representation of Krishna, the others are Bal Rama his brother, and Subhadra his sister.

Mill, in his 'History of British India' (2. ii. c. 6), says,
being, it would appear, to charge his antagonist with holding the heretical opinions of Socinus. (Bosmet, Hist. des Variations, vol. iv. p. 64; vol. v. p. 250-258.) With all these defects Jurieu's last work is to be considered. His learning was most profound, he is generally exact in the citation of his authorities, and he had a special talent in discovering the weak point in the cause of his antagonists. In respect of style, he is perfectly correct, but he is at least his equal in polemical talent, and by some is considered his superior in erudition. Jurieu's private life was becoming that of a Christian minister: he was charitable to his poor, and exerted himself most benevolently for the good of his fellow creatures. He was particularly zealous in alleviating the sufferings of his exiled brethren. He died at Rotterdam on the 11th of January, 1718. His works, which are very numerous, were extremely popular in his day, and many of them are still held in high estimation by theologians of every school, on account of the great learning which they display. The principal of these are—1, 'A Treatise on the Criticism, 2, 'Defence of the Morality of the Reformed Church,' Hague, 1685, in answer to a work by Arnauld, entitled 'Moralitie destroyed by the Calvinists.' 3, 'A Treatise on the Change in Religion,' which was written to refute Bosmet's Exposition of the Catholic Faith.' 4, 'Letters against the History of Calvinism by De Mainmbour,' 2vols. 5, Another collection of controversial letters, entitled 'Moral and Political Inocence.' 6, 'A Treatise on the Church.' He considered it composed of all Christian societies who hold the common principles of the Christian faith. This treatise is sometimes accompanied by a Beverian, and sometimes by a Jansenist refutation of it. 7, 'A History of the Doctrines and Worship of the Jews, Amsterdam, 1704, with a Supplement published in 1706. 8, 'A Treatise on Mystical Theology,' composed on the occasion of the well-known controversy between Feénelon and Bosmet.

JURISDICTION. This term is the Latin word Jurisdiction, which simply signifies the declaration of jus or law. It was employed by the public magistrates to declare the law. The whole office (officium) of him who declared the law was accordingly expressed by the word Jurisdiction. (Dig. 2. tit. De Jurisdictione.) Jurisdiction was either voluntary (voluntaria) or litigant (contentiosa). The jurisdiction voluntaria related to certain acts, such as for instance those forms of manumission and adoption which must be done before a magistrate in order to be valid. The jurisdiction contentiosa related to litigation, and such legal proceedings were said to be in jure, before the magistrate, as opposed to the proceedings before a judge, which were said to be in judicio. The magistratus was said 'in judicio' or 'red rerum, who had exercised his function, and 'qui Romae jus dict' are accordingly convertible terms. Jurisdiction in England means an authority which a court of law or equity has to decide matters that are litigated before it. Such courts are commonly called superior courts. Where the parties were deprived of the permission to give public instruction in that town, he retired to Rouen, and from thence went to Rotterdam, where he was appointed Professor of Theology. In that city the ardour of his zeal soon drew him into controversy with Bayle, Basset, and Saurin; in the heat of which he manifested the same rancour which unfortunately disgraces most of his polemical writings. He allowed himself likewise to fall into various errors by too many indulging a curious and lively imagination in the interpretation of prophecy. In his Commentary on the Apocalypse he even predicted the establishment of Protestantism in France during the year 1660. Those who differed from him in opinion, however high their character for learning and piety, he treated with a most unbecoming severity. Godin and Hammon, perhaps the two greatest theologians of that age, because they differed from him on the subject of the Antichrist predicted in the Book of Revelations, he styles 'the disgrace of the Reformed Church, and even of Christianity. The same spirit is seen in his polemical controversy with Bosmet, Bishop of Maux, whom he does not scruple to accuse of falsehood and dishonesty, though, on the other hand, it must be allowed that the recriminations of this celebrated defender of the church may be, if not politely expressed, at least detestate of truth; the great object of Bosmet
guardians of the realm, during his absence; and similar appointments were very frequent under the early Norman and Plantagenet kings. There is a commission of a Custos Rotundi in Rymer of the reign of John. One by Edward I. to the Earl of Pembroke describes the powers of the office in terms which imply that it had long been familiar, as extending over all the counties of the realm; but its precise nature is uncertain; it may have been a custodiam potestatis dictum custodiam pertinent; and the same words are common in subsequent commissions. And down to the present time similar words are found in various commissions, and with more or less extensive powers applied to various officers and persons, whether they be protectors, lieutenants, or locum tenens, and regent, have been among the other names by which they have been known. Republican governments have been accused of having no king or queen, but this has been sometimes named by the preceding successor of the crown; but in modern times such arrangements have been usually made by statute. Coke remarks (4 Inst. 58) that the methods of appointing a guardian or regent have been so various, that the surest way is to have them made by authority of the great council in parliament.

The most familiar case of the appointment by the crown of a representative to exercise the supreme executive power, not in a colony or dependency, is that of the appointment of a governor for Ireland, who has commonly borne the name of the Lord Lieutenant or the Lord Deputy; or of a council of government, to be styled Council of State.

The governor-general of Ireland under the crown has been styled at different times custos (Keeper or guardian), justiciary, warden, procurator, seneschal, constable, justice, deputy, and lieutenant. The last was reserved during the time of the king's custumary. Formerly, upon the avoidance of the king's lieutenant for Ireland by death or otherwise, the privy council there was authorized to elect a successor, with the restriction that he should be an Englishman and no spiritual person, who held office till the king appointed another. The antient powers of this office were almost regal; he executed every act of government without any previous communication with England; and when he left the country he was entitled to the custody of the great seal. From about the time of the Revolution, however, till after the commencement of the reign of George III., the lord-lieutenant resided very little in Ireland; in several instances the person appointed was never sent out; in other cases he went over once in two years to hold the session of parliament; and the government was very often left in the hands of lords justices, without a lord-lieutenant at all. In modern times the appointment of lords justices for Ireland has only taken place on the occasional absences of the lord-lieutenant, and during the interval which has sometimes occurred between the demise of one lord-lieutenant and the appointment of another.

The lords justices have been represented as being the executive magistrates of Ireland, the persons who can make such appointments, and the joint judges of the inferior courts.

In England lords justices and regencies have been repeatedly appointed since the Revolution, on occasion of the king going abroad; and these appointments have been made by royal letters patent under the great seal, in the same manner as the lords-lying-treasurer and lords justices of Ireland. When the king was abroad, however, the aid of parliament has been called in for certain purposes. When King William went over to Ireland in 1689, he of his own authority appointed the administration of the government to be in the hands of the queen during his absence out of the kingdom, not, however, we suppose, by letters patent, but merely by declaration at the council-table; and at the same time an act of parliament was passed, 1 & 2 Wm. and Mary, sess. 2, in the preamble of which that declaration of his majesty's pleasure was recited, and it was enacted, that whenever and as often as his majesty should be absent out of this realm of England, it should and might be lawful for the queen to appoint such number of persons as she should think fit, in the names of both their majesties, for such time only, during their joint lives, as his majesty should be absent. This act was considered as necessary or expedient, in consequence of which it was also provided that his majesty's pleasure was placed by the Act of Settlement, which had declared that the entire, perfect, and full exercise of the regal power and government should be only in and executed by his majesty in the persons of himself and his heirs. The proclamation was at the same time provided, 'That as often as his majesty shall return into this kingdom of England, the sole administration of the regal power and government thereof, and all the duties of his government, and of his magistracy, shall be by the queen's pleasure and the great seal annexed, shall be in his majesty only, as if this act had never been made.' After the queen's death lords justices were repeatedly appointed by King William, on occasion of his going abroad, under the great seal, namely, 6th May, 1692; 22nd April, 1697; 16th July, 1698; and 31st May, 1699.

One of the provisions of the statute of 12 & 13 Wm. III. (passed in 1700) for settling the succession in the House of Hanover, was, that the possession of this crown shall go out of the dominions of England, Scotland, or Ireland, without consent of parliament. This clause, however, was repealed in 1716, by 1 Geo. I. stat. 2, c. 61. The repeal was made by act and statute, whose 'impunity to visit his German dominions,' says Coke in his 'Life of Walpole,' '77, 'now became so great as to render him and others of great property, and impiously to demand indulgence.' The ministry, continues the historian, 'were considerably embarrassed on this occasion; and drew up a strong remonstrance, representing the inconvenience which would result from the proposed journey. The remonstrance, however, not only failed of success, but so far exasperated the king, that he declared he would not endure a longer confinement in this kingdom.' It was thought more respectful to his majesty to obtain a repeal of the restraining clause at once, than to ask parliament merely for the leave of absence; and the bill passed through all its stages in both houses without a dissentient voice, being only obliged to the viceroy of France, the duke of Louviers, and the Whigs adverse or frightened to offend the king. His majesty, who was at variance with his eldest son, now interposed another difficulty, refusing to intrust the government to the council of gentlemen. An amendment of this kind was brought in, and a new bill was passed, authorizing the king to appoint any number of persons with him in the commission, and also limiting his authority by the most rigorous restrictions. Upon this point, however, he yielded at last to the representations of the ministers, who concluded a long expostulation of reasons against his leaving the kingdom at all at that crisis by stating, 'Upon a careful perusal of the precedents, finding no instance of persons being joined in commission with the Prince of Wales in the absence of the regent, the king resolved to extend such restrictions upon such commissions,' they were of opinion that the constant tenor of antient practice could not conveniently be receded from. (See the paper in Coke, ii. 51-54.) Upon this the king submitted to give the privilege of appointment of a commission of affairs; 'yet,' says Coke, quoting from the work called 'The Political State of Great Britain,' 'he appointed him Guardian of the Realm and Lieutenant, an office unknown in England since it was enjoyed by Edward the Black Prince.' In point of fact the title given to the prince in the original Latin commission was Custos Regni nostri et Locum tenens, which were the same words that had been commonly used in all such commissions down to the reign of Henry VII. With this difference only, that one of the two titles (more frequently Custos Regni) was alone employed. The earliest use of the term regent appears to have been in a commission from Henry VIII. to Queen Katherine Parr, who was next in line after Catherine of Aragon, to Boulogne in 1544, in which she is styled Rectoris et Gubernatrix Regni nostri. Queen Mary, the wife of William III., whose case is the subject of the present article, had no commission; and being queen regnant in her own right, she was not even popularly styled regent.

When George I. went abroad the next time, in May, 1719, he intrusted the government during his absence not to a regent, or any single person, but to thirteen lords justices, namely, the Archbishop of Canterbury and the principal officers of the state. A translation of the commission issued on this occasion, or rather, of the warrant to the attorney-general to prepare the commission, has been printed in the report of a committee of the House of Commons which sat in December, 1788, and affords us probably the most complete and authentic form, in a printed form, of any of these documents; and we shall here give a complete transcript of the present article. The committee that state that they found no entry of any earlier commission, except of the one issued in 1699, and that that was nearly the same with that of 1719, which appears to be the sole original, or the only one that has been subsequently issued. The commission begins by reciting that his majesty had 'determined, for divers weighty reasons, speedily to go in person beyond the seas.' The persons commissioned are 'the lords justices of our said kingdom of Great Britain, and our lieutenants in the same, during our absence out of our said kingdom, or till further specification in these present commission.' In the names of all of our pleasure, 'to execute the office and place of guardians, &c., and to order, do, and perform all and every act and acts of
government and administration of government, and all other matters and things whatsoever, which, by virtue or by reason of law or usage or custom or place, or may by lawfully ordered, done, or performed. Power is afterwards specially given to keep the king's peace, to cause the laws and customs of the kingdom to be specially observed by all, to summon and order, to hold and upbraid the parliament of the kingdom, to summon, hold, and execute, and likewise to summon and hold another parliament and other parliaments, and the same to continue, prorogue, and dissolve it, and likewise to summon and hold another parliament and other parliaments, and the same to continue, prorogue, and dissolve it; also, for and in respect of the command, the king's seal, royal signet, and other necessary authority to the king and his officers, and to the queen and her officers, and to summon and hold the Privy Council, and to appoint committees of the same; with the advice of the Privy Council, to issue proclamations, and to do and perform all other things which have been usually done, or may be done, by us, by or with the advice of the same; to appoint and authorize persons to treat with the ambassadors, commissioners, and ministers of emperors, kings, princes, republics, or states, and to make and conclude treaties, conventions, and leagues thereupon; to confer, grant, and present to all benefices, dignities, and ecclesiastical promotions, which are in the crown; to issue commissions, orders, and warrants, under the privy seal or otherwise, to the treasurer, or commissioner of the treasury, and other officers, for and in respect of the collection, levying, appropriating, and expending royal revenues and royal treasure and revenue; to command the army; to suppress insurrections and insurrections to execute and employ martial law in time of war, if that should happen; in like manner to command and employ the naval forces of the kingdom; to appoint and to discharge from all offices at the disposal of the crown; to grant pardons for high treason and all other crimes and offences; and finally, to do all these things in Ireland as well as in Great Britain.

This enumeration is probably the most authentic compendium that has been published of the powers of government, ordinary exercised by the crown. It does not, however, profess to be an enumeration of all the powers resident in the crown; and it will be especially observed, that (besides, perhaps, some appertaining to the office of supreme head of the church) the power of creating peers and conferring honours is not made over to the lords justices. That is a power which, we believe, never has been delegated, or attempted to be delegated, if we except only the case of the patent granted by Charles II. of Ireland, in 1644, to Lord Herbert (better known as the Earl of Glamis). After persecution, he was compelled to resign by the interference of the House of Lords.

The Lords Justices are further required in the commission of 1719, in the execution of their powers, punctually to observe his majesty's will and pleasure, as it might be from time to time more clearly and distinctly expressed in instructions signed by the royal hand; and the commission was to be accompanied by a set of instructions, also printed in the Report of the Committee of 1788, and stated to be nearly the same that had been issued, as far as was known, on similar occasions before and since. The rules prescribed are twenty-one in number, the most important things directed in which are, that no livings or benefices in the gift of the crown which may become vacant shall be disposed of without his majesty's directions to the persons to be signified from beyond the seas under the sign manual; that no orders or directions concerning the disposition of money at the treasury shall be given before his majesty's pleasure shall have been signified thereupon; that no orders must be given for dissolving the parliament, or calling a new one, without special signification of the royal pleasure. The same restriction is put upon the exercise of the power of pardoning, and some others. In case it should be necessary or expedient for the public service, the Lords Justices are authorized to fill offices immediately, and also to preserve criminals; and they are permitted to continue the sessions of the parliament until they shall otherwise be directed under the royal sign manual, and to summon the privy council to meet as often as they shall see occasion.

The government was in the same manner intrusted by George I. to Lords Justices when he again went abroad in 1720, 1728, 1729, and 1727. It is strange that the Report of 1788 should notice only the second of the several regencies of Queen Anne, but not even so much as to intrust the regency to George II. Her majesty so long as she lived was always intrusted with the administration of the government when the king went abroad; which he did in 1729, in 1732, in 1738, in 1746, in 1754, and in 1760. To enable her majesty to be regent of this kingdom, during her majesty's absence, without taking the oath; on the 15th of May thereafter, according to Salmon's Chronologie en Anglee, the queen, now regent, and George II. in his own person, viz. by virtue of the royal title, did certify the queen and lady of the realm, viz. the queen regnant, and George II. in his own person, viz. by virtue of the royal title, did certify the queen and lady of the realm, viz. the queen regnant, curtailing a guardian and lieutenant of the kingdom during the queen's absence; and the same authority states she to have been appointed guardian in 1729, and regent on the two other occasions. The queen was also to sign the bills which were to be enacted in such parliaments, according to the laws and statutes of the kingdom of Ireland; to summon and hold the Privy Council, and to appoint committees of the same; with the advice of the Privy Council, to issue proclamations, and to do and perform all other things which have been usually done, or may be done, by us, by or with the advice of the same; to appoint and authorize persons to treat with the ambassadors, commissioners, and ministers of emperors, kings, princes, republics, or states, and to make and conclude treaties, conventions, and leagues thereupon; to confer, grant, and present to all benefices, dignities, and ecclesiastical promotions, which are in the crown; to issue commissions, orders, and warrants, under the privy seal or otherwise, to the treasurer, or commissioner of the treasury, and other officers, for and in respect of the collection, levying, appropriating, and expending royal revenues and royal treasure and revenue; to command the army; to suppress insurrections and insurrections to execute and employ martial law in time of war, if that should happen; in like manner to command and employ the naval forces of the kingdom; to appoint and to discharge from all offices at the disposal of the crown; to grant pardons for high treason and all other crimes and offences; and finally, to do all these things in Ireland as well as in Great Britain.

Nevertheless, no provision such as had been customary on such occasions was made for the exercise of the royal authority, either when her present majesty made her short excursion to the French coast in 1843, or when she made her last more extended visit to Germany (in August and September, and October and November, 1845). The commission in which the writer, after stating that Lord Eldon considered it indispensably necessary that Lords Justices should be appointed on that occasion, adds:—' One good effect arose from their appointment, that the lords justices continued during his (the king's) absence signed an immense number of military commissions and other documents, which had been accumulating since his accession to the throne.' This writer contends that 'the royal authority of the English monarch cannot be personally exercised in a foreign country.' "We take it," he adds, 'to be quite clear, that a patent sealed with the great seal in a foreign country would be void. To guard against any such irregularity, the law requires that the patent shall state the place where it is signed and sealed as apud Westminsterium.'

It ought to be mentioned that the seven persons appointed in 1703, as the Lords Justices, were the Duke of Marlborough, the Duke of Ormonde, the Duke of Queensberry, the Duke of Cumberland, the Earl of Shrewsbury, and the Duke of Buckingham. In 1703, the 1st August, the 6 Anne, c. 7, to administer the government along with other persons whom the new king or queen should have named, in case of his or her absence at the time from the kingdom of Great Britain: and after the death of his (the king's) wife, the king, in his own person, was called regent of the kingdom, and in the common accounts. These Lords Justices (twenty-six in all), who actually came into office on the death of Queen Anne, 1st August, 1714, and continued for three years, had the privilege of the kingly office, enjoyed more extensive powers than any others that have
been appointed, at least in modern times. They were author-
ized, in the name of the successor, and in his or her stead,
to use, exercise, and execute all powers, authorities, matters,
and acts of government, and administration of government, in
as full and ample manner as such next successor could use or
execute the same if she or he were present in person within
this kingdom of Great Britain, until such successor should
arrive, or otherwise determine their authority. The only
restrictions laid upon them were, that they were not, without
direction from the 'queen or king,' to dissolve the parliament;
and that they would subject themselves to the pains of high
treason if they gave the royal assent to any bill or bills for
repealing or altering the Act of Uniformity, or the Act in
the Establishment and Maintenance of the Presbyterian
Church Government in Scotland.

We are not aware that these facts have ever before been put

together. The most important of them have been derived
from the Report of the Committee appointed by the House of
Commons in 1788, 'to examine and report precedents of
such proceedings as may have been had in the case of the
personal execution of the royal authority being prevented or
interrupted by infancy, sickness, infirmity, or otherwise,'
11-42. See also, besides the other sources that have been
already referred to, an article 'On the Regency Question,'
46-80. And some particulars may be gleaned from the ac-
counts of the proceedings in the two Houses of Parliament on
occasion of the king's illness in 1788, as reported in the
'Parliamentary History,' vol. xxvii. pp. 655-1297; and from
the discussions on the Regency Bill from the beginning of
November, 1810, to the middle of February, 1811, which
nearly fill the 18th volume of the 'Parliamentary Debates.'

One of the speeches which attracted most attention on the
latter occasion for its argument and research was afterwards
published in an authentic form; that delivered on the 31st of
December, 1810, by John Leach, Esq. (afterwards Vice-
Chancellor).

JUSTICIARY COURT in Scotland. To render the

historical article on this subject under the head of JUSTICIARY

[P. C.] fully intelligible, it may be mentioned that the High-
Court of Justiciary is the supreme criminal court in Scot-
land. It consists of the Lord Justice General, Lord Justice-
Clerk, and five other judges of the Court of Session. It sits
at Edinburgh, from time to time during the year, according
to the extent of business to be transacted. Offences com-
mitted in Edinburgh and within the district of the Leithians
are tried before this court, and in cases where in other parts
of the country waiting for the next Circuit Court would create

much delay, or where there is any other ground of ex-
pediency, the trial may proceed before the Central Court.
Other trials in the provinces proceed before the circuit courts.
These are held in spring and autumn, each by two judges
deputed by the High Court of Justiciary. The southern

circuit is held at Jedburgh, Ayr, and Dumfries; the western,
at Glasgow, Inverness, and Stirling; and the northern at Perth,
Aberdeen, and Inverness. An additional circuit is held at

Glasgow in winter. Questions may be certified from the
circuit courts to the High Court of Justiciary, that no decision once
given can be reconsidered either by the court pronouncing it
or a Court of Review. This principle is liable to many ob-
jections, but it is productive of one benefit, that no trial is
thrown away by the subsequent discovery of flaws in initial
procedure. Before the case goes to a jury, a judgment is
pronounced 'finding the indictment relevant,' and virtually
declaring that the initial procedure is regular; that the charge
is properly laid, and that the offence if proved is punishable.
If there be any objections to the regularity of the proceedings,
they must be stated before this judgment, which when once
pronounced is final. All cases before the Court of Justiciary
are tried by a jury of fifteen, a majority returning the verdict
where they are not unanimous. It has jurisdiction in all the
more serious offences except high treason, which is adjudicat-
ed in the English manner by a Court of Oyer and Ter-
miner.

Justifiable Homicide [Murder, P. C.]
Juveni Celsus [Celsus, P. C. S.]
KAFFA, a country in the eastern parts of Africa, of which we have only lately got some information, and which hitherto has been known by any European traveller, so far as is well known. It is said to be of considerable extent, larger than the country of the Shoa [Astrinmia, P. C. S.], and appears to occupy the space between 3° and 5° N. lat. and 39° and 54° E. long. It contains many mountains, which are separated from one another by wide valleys. Numerous watercourses drain the country, and all of them join the Goshap, a large river originating in several branches to the south and west of Kaffa, which probably falls into one of the rivers whose embouchures have been recognised on the coast of Zanzibar. On the north of Kaffa is Enare, and on the west a wilderness, in which numerous herds of large quadrupeds (elephants, giraffes, &c.) are found. The country is fertile, and partly well cultivated. Cotton is grown to a great extent. The coffee-tree is there, as well as in the neighbouring country of Enare, indigenous and a forest-tree. It is not stated that coffee was an article of export, but it is thought that the coffee-raisers in these parts have derived its name from this country, as the Arabs assert that it has been transplanted to Yemen from that part of Africa.

The capital is Socone, a town which, according to the accounts of African travellers, has between 6000 and 7000 inhabitants. This place and some others are visited by the merchants of Enare, who exchange their goods (rock-salt, copper, and some lime-stone brought from Gondar), for cotton, cotton-clotth, which is made in the country, and slaves; this is the only way by which the inhabitants dispose of their produce and obtain foreign goods. The inhabitants, it is said, call themselves Christians, but none of the practices by which the Abyssinian church is distinguished are in use among them.

(Kraft, Bericht von dem Flusse Goshap und den Ländern Enare, Kaffa, und Dedo, in the Monatsschriften der Berliner Gesellschaft für Erdkunde.)

KAINE, LE HENRI-LOUIS, a French actor, so often spoken of in the memoirs of French literature in the middle of the eighteenth century, that some account of him may be useful. He was born in 1728, and died in 1778. He was a protégé of Voltaire, who observed the natural strength of his histrionic genius, and removed him from the humble operative profession. He acquired his chief celebrity in the characters of Voltaire's plays; yet, owing to a singular series of events, that author never saw him on the stage. He was unable to make his début until seventeen months after Voltaire's departure for Prussia, in 1750, and on the author's return, after an absence from Paris of twenty-eight years, he found the actor about to be buried. Louis XV. stamped the reputation of Le Kain, by a lettre de cachet; not qu'il ne pleure gun. Like the English actor to whose name that of Le Kain bears a great resemblance, he was small in person, and his success arose from his power of representing deep passion and vehement emotion. The character of his acting was wovell, and while it fascinated the audience, it did not at first satisfy the critics, who termed him le convulsionnaire. He was critical and accurate in costume, and attended minutely to its topical and chronological applicability.

(Biographie Universelle.)

KALEIDOSCOPE, a name compounded of two Greek words (καλλος and στρατη), and denoting the exhibition of beautiful forms, is the designation of an optical instrument which was invented by Dr. (Sir David) Brewster, and made public in 1817.

About three years before that time Sir David Brewster, being engaged in making experiments on the polarization of light by reflection from plates of glass, observed that when two plates were inclined to one another, and the eye of the spectator was nearly in the produced line of the common section of their planes, the farther extremities of the plates were multiplied by successive reflections so as to exhibit the appearance of a circle divided into sectors, also that the several images of a circle near those extremities were circularly disposed about the centre. From these circumstantes were suggested the idea of the construction of an instrument of the kind above named.

It may be observed, however, that the multiplication of the image of an object by successive reflections from mirrors in-
The angle $\angle ABC$ be $2\theta$ of four right angles, in which $m$ is any term in the series of even numbers 4, 6, 8, 10, &c., the number of mirrors will be $m$, and each of them will be equal to $\angle ABC$, while $C$, the appearance of the line in which the mirrors meet each other, will, as in the figure, bisect the angle which is opposite to $\angle ABC$; also if $m$ be any term in the series of odd numbers, 3, 5, 7, &c., the number of mirrors which will be $m$, and each of them will be equal to $\angle ABC$, while $C$, the appearance of the line in which the mirrors meet each other, will coincide with the line in which the two lowest sectors join one another. It may hence be understood that if a flat object placed in the sector $ABC$, with its plane perpendicular to the mirrors, have its bounding-lines similarly situated with respect to $A$ and $B$, the reflected images will be equidistant; and that the number of images which will constitute one geometrical pattern, whichever the value of $m$ be odd or even; but if the bounding-lines are not similarly situated with respect to $A$ and $B$, the reflected images will not, in the two lowest sectors, unite so as to correspond to the images in the other sectors, unless $m$ be an even number.

The second figure represents a pattern produced by the objects represented in the sector corresponding to $ABC$ in the first figure.

In order that the whole pattern in the field of view might possess perfect symmetry about the centre $C$, it would be necessary that the eye should be exactly in the direction of the line in which the glass plates meet one another; but in such a situation the reflected images would not be visible: if the eye were far above the line of meeting, the visible field of view would be sensibly elliptical, and the brightness of the field of view would be less; but if it followed, so as to be near the small ends of the mirrors, and very little above the line of their junction. Again, it may be readily understood that, in order to permit the reflected images of objects to be symmetrically disposed about the centre of the field of view, the object should be exactly in a plane contiguous to the mirrors at the extremities which are farthest from the eye; for in the line in which the planes of glass meet each other, appearing to pass through the common centre of the visible sectors, if the object were placed on that line of junction, and either between the eye and those extremities or beyond the latter, it is evident, the eye being about the line of meeting, that the apparent or projected place of the object would not coincide with that common centre, but in the former case would appear below, and in the latter above, that centre. The length of the mirrors should be such that the object in the sector $ABC$ may be distinctly visible; the eye may, however, if necessary, be assisted by a convex or concave lens.

The first kaleidoscopes constructed by Sir David Brewster consisted simply of the two mirrors, which were fixed in a cylindrical tube; the objects were pieces of variously coloured glass attached to the farther ends of the mirrors and projecting into $\angle ABC$ between them. Some of these objects were placed between two plates of very thin glass, and held by the hand or fixed in a cell at the end of the tube. In some cases these plates were moved across the field of view, and in others they were turned round in the form of a glass tube. The pieces of coloured glass or other objects which were situated in the sector $ABC$ were, by the different reflections, made to appear in all the other sectors; and thus the field of view presented the appearance of an entire object or pattern, all the parts of which were disposed with the most perfect symmetry. By moving the glass plates between which the objects were contained, the pattern was made to vary in form; and pleasing variations in the lights were produced by moving the instrument so that the light of the sky or a lamp might fall on the objects in different directions. When the objects in the sector $ABC$ are confined near its upper or lower edge, a form of pattern is obtained, and, on placing the two mirrors parallel to one another, the successive reflections of the objects produce one which is remarkably beautiful. Sir David Brewster subsequently found means to obtain multiplied images of such objects as flowers, trees, and even persons or things in motion: and thus the instrument was greatly increased in utility. They fixed a frame at a right angle to the mirror, so that the two mirrors might be fixed in a tube as before, but the tube was contained in another from which, like the eye-tube of a telescope, it could be drawn at pleasure towards the eye: at the opposite end of the exterior tube was fixed a glass lens of convenient focal length, by which there were formed images of distant objects at the place of the sector $ABC$. These images were named objects which, being multiplied by successive reflections from the mirrors, produced in the field of view symmetrical patterns of great beauty.

Some kaleidoscopes have been executed in such a manner that the two mirrors may be placed at any required angle with one another, by which means the images in the visible field of view may be greatly increased. The flat glasses of the mirror are also of being constructed so that the multiplied image may be projected on a screen, and thus made visible at one time to many spectators. In order to obtain this end, the rays of light from a powerful lamp are, by means of a lens, made to fall upon the object in $ABC$ at the farther extremities of the two mirrors; and at the eye-end of the instrument is placed a magnifying lens of such focal length that the emergent cones of light from the emergent pencils may converge on the screen: there will thus be formed on the latter a magnified image of the whole pattern. The tube containing the glass plates frequently mounted on a stand having a ball-and-socket joint, on which it may be turned in any convenient direction; and the instrument being thus supported, the figures in its field may be easily sketched by a skilful artist, who by means of such an apparatus may be greatly assisted in designing beautiful patterns.

Sir David Brewster's account of his invention is contained in his 'Treatise on the Kaleidoscope' (Edinburgh, 1819): but Dr. Rogot has shown ('Annals of Philosophy,' Vol. xli.) that the properties of the instrument may be greatly extended by employing, instead of two, three and even four plane mirrors, united together at their edges so as to form a hollow prism, or a frustum of a pyramid, the reflecting surfaces being directed towards the instrument. The objects which are thus made visible by means of Kaleidoscopes, the instruments constructed with three plane mirrors appear to produce the most pleasing effects; the mirrors may be disposed so that a section perpendicular to the line of view shall be a right-angled triangle, a right-angled triangle, or a right-angled triangle having its two acute angles equal to 30° and 60°. The first disposition of the mirrors affords regular combinations of images in three different directions which cross each other at angles of 60° and 120°; and to instruments of this kind Dr. Rogot gave the name of Triascope. With the second disposition the field is divided into square compartments having the hypotenuse of the triangle for their sides, which are called Polycentric. The third disposition exhibits a field of view divided into hexagonal compartments; and hence the instrument is designated a Hexascope.

Sir David Brewster obtained a patent for the kaleidoscope, and several opticians of London and other places were duly authorized by him to execute and sell them; but the refinement of taste are too often disregarded in the imitation of works of art; and, apparently, the public did not adequately encourage the manufacture of the instruments of a superior kind; while, in violation of the patent, imitations of the kaleidoscope, refined in form and execution, were sold at low prices, by unprincipled persons, in such numbers that it is doubtful whether the distinguished philosopher to whom optical science is so many accounts so highly indebted derived any pecuniary benefit from his invention.

KALENDAR, REVOLUTIONARY. It has been pointed out that there is a mistake in the commencement of the French revolutionary years as given in Year P. C. On examination we find that not only the article cited, but many other works give an account of this calendar which is more or less incorrect. The decree of the National Convention, which fixed the new mode of reckoning, were both vague and insufficient, so that it is no wonder that many detailed accounts neither agree with each other nor with the truth. To learn what the truth was, we have recourse to a French work, in its sixth edition: 'Concordance des Calendriers Républicains et Antique,' par L. Simonet, Paris, 1795, 4to, pp. 1-8vo. This work puts every day of every year, from an Ill. to an XXII. both inclusive, opposite to its day of the Gregorian calendar: it also gives the decrees of the National Convention. By these decrees it appears that the year is to begin at the midsummer of Paria Observatory which precedes the true autumnal equinox. It is to consist of 365 days, with 12 months of 30 days each, the 31st day of each month being the 31st day, and 5 complementary days, which were tastefully called sanseculotides (a name afterwards repealed). A sixth complementary day was to be added, not according to any rule, but at the pleasure of the President of the Directory, and although it was stated that it would be ordinance necessary to add this 366th day once in four years, yet it was not even stated in what particular coming years the necessity
For instance, what is 14 Floral? An XII. The republican year begins Sept. 24, 1803, so Floral falls in 1804, which is Gregorian leap-year. Look at the third Table, and when the year begins Sept. 24, the first of Floral is April 21; consequently, in 1803, which is June 4, 1804, in the French calendar? The year is not Gregorian leap-year; and An VIII. contains it, which begins Sept. 23. Look in the second Table, and in such a year it appears that June 1 falls on the 12th of Prairial; therefore June 17 is Prairial 28.

KALUGJEW is a considerable island in the circle of Mesen, in the Russian government of Archangel, and situated in the north part of the White Sea. It lies between 68° and 69° 40' N. lat., and 47° 30' and 48° 10' E. long., and is about 60 miles in diameter. The surface is undulating; it has some low mountains, which rise in the centre, two small rivers, and several brooks of fresh water. The surface is covered, as in Mesen, with mosses; there are extensive morasses; the ground bears nothing but berries, some antiscorbutic plants, and stunted bushes. The surrounding sea is shallow, but swarms with fish; the coast abounds in seals, walruses, and other such animals. The cliffs are covered with an incredible number of sea-birds; the interior is full of polar-bear foxes, &c. Except a few Samoils there are no settlers. Rebekahh, a colony of Russian believers, live in their own way. They feed themselves here in the 18th century; but soon left the island. At present it is only frequented by fishermen and seal-hunters from Mesen and Archangel. The little island of Plotki-Koeky and some others are near to Kalugjew.

(Hassel, Handbuch, vol. xi.; Canadisch, Lehrbuch.)

KALMIA, a genus of plants named by Linnaeus in honour of Peter Kalm, professor at Abo in Sweden. It has a small five-leaved capsule, the calyx, and the angulhar incurved open limb having ten nitches in its sides. The capsules five-celled and many-seeded. The species are evergreen shrubs with alternate or verticillate leaves.

K. latifolia has its leaves on long petiolo, scattered or three in a whorl, smooth and green on each side. It is a native of N. America from Canada to North Carolina, on the sides of stony hills. It has various names in the United States, Laurel Ivy, Spoonswood, Calico-bush. The flowers are red, and when in blossom have a very elegant appearance. The leaves of this species are said by Barton to be poisonous to man and beast, but their action can be but feeble and unimportant, for animals are known to feed on the plant without any evident effect. Bigelow however states that the flesh of pheasants having eaten this plant has produced some cases of severe disease attributable to this cause alone. The flowers of the K. latifolia exude a large quantity of sweet nectarous juice, which is greedily collected by bees and wasps, but the honey formed from it is injurious to man, and the juice, if swallowed itself, will produce an intoxication of an alarming kind. A brown powder which adheres to the shoots and branches is used as a stimulant by the Americans.

K. angustifolia, Haulm-leaved Kalmia, has petioloate leaves, scattered or in a whorl, oblong, obtuse, rather rusty beneath, coryza laterals, bracteoles linear, flowers and calyxes clothed with glandular pubescence. It is a native of North America from Canada to the Carolinas, in bogs and swamps, and sometimes in dry mountainous lands. It is a shrub one or eight feet in height, with dark red flowers. It is called Sheep-Laurel in North America, as it is supposed to be very injurious to sheep. Several varieties of this plant with lighter and darker flowers have been described. There are several other species, all of them natives of North America. They are all remarkable for the irritability of their stamens, and each of the stamens has a little cavity formed for it in the corolla, to serve as a receptacle to the anther.

They are handsome shrubs when in blossom, and are great favourites in gardens and shrubberies. They grow best in a peat soil, or they may be planted in a very sandy loam or vegetable loam. They may be propagated by layers or seeds. When the seeds are used they should be sown early in the spring in flat pans or pots filled with peat earth, and very slightly covered over; the pots may then be set in a close frame. To the front of a hole made, till the plants come up, when they may be transplanted to other pots, which should stand in a close frame till they have struck root; they should then be hardened to the air by degrees.

KATER, HENRY, an English mathematician of some eminence, and an excellent practical philosopher, was born at Bristol, April 16th, 1777. But of his early life very little is

Besides these valuable papers, Captain Kater was the au-

thor of a large portion of the work entitled 'A Treatise on

Wave Machines,' containing one of the volumes of Dr. Lardner's

'Cyclopedia'—this volume being the joint production of

Lardner and Kater. In it is a chapter on the subject of pe-

ndulums constructed on the principle above mentioned; and it

may be observed that it was the first time in the literature of

dynamics that the relation of force to distance between the

knife-edges, Captain Kater employed a scale furnished with

powerful microscopes, to which one of a micrometer was adapted:

with this apparatus the 10,000th part of a second of arc was ac-

curately determined. In 1832 'An Account of the Construction

and Verification of certain Standards of Linear Measures for the

Russian Government,' 4to., London.

Captain Kater was a fellow of the Royal Society of Lon-

don, and in 1814 he received from the Emperor of Russia the

decoration of the Order of St. Anne. After a life spent in

philosophical research, he died in London, April 26, 1835,

leaving behind him many proofs of his zeal for the promotion

of physical science.

(From the papers in the Philosophical Transactions.)

KAUFMANN, MARIA ANGELICA, was born at

Chur in the Grisons, or Graubünden, in 1741 or 1742. Her

father, Joseph Kaufmann, was a portrait painter, of very or-

dinary ability; he, however, devoted unusual attention to the

education of his daughter, who displayed uncommon abilities

at an early age, both in music and painting. Though still

while young, to Milan, where they dwelt some time; and

in 1763 they visited Rome, and there Angelica attracted uni-

versal notice and admiration for her portraits, which were

excellently exhibited. She came to England in 1770, and

founded the first class of portrait painters. She was a

friendly relation of Anglica's, and frequently attended her

speeches in admiring terms of Angelica's accomplishments,

especially her facility in speaking the German, Italian, French,

and English languages.

In 1765 Angelica visited Venice, and in the same year,

in company, with Lady Wentworth, to England, where

she was received in a most flattering manner; she was elected

one of the original thirty-six members of the Royal Academy,

founded in 1768. She returned to Italy in 1782, having in

the previous year been married to Antonio Zocchi; she did

not, however, change her name, but was always known as

Angelica Kaufmann. She died at Rome in 1807, or accord-

ing to some accounts in 1808. She etched several plates, and

many of her own works have been engraved by Bartolozzi

and other eminent engravers. Angelica is said, previously to her

marriage with Zocchi, to have been cheated into a marriage

with an adventurer who gave himself out as a Swedish count:

as the story, however, though often repeated, does not appear

to be sufficiently authenticated, an allusion to it is sufficient.

The account of her which appeared in Huber's ' Manuel des

Artisans,' etc. was directly contradicted by Angelica herself, in an

Italian periodical in 1806; but the story of the impostor does not

occur in this notice.

Angelica, though not beautiful, had a very graceful person

and most agreeable countenance; she was by no means

complimented generally. To these attractions must be attributed

her success, for as a painter she did nothing of value beyond

an elegant female portrait, or an occasional female figure.

Her compositions are deficient in every essential quality of

art; in drawing she was extremely feeble, and her male and

female characters are not otherwise different than in costume.

(Goeze, Windhämml und sein Jahrhundert; Fiorillo, Geschichts der Zeichnen Kunst in Deutschland, etc.; Nagler, Künstler Lexicon.)

KEAN, EDMUND, was born about 1787, in London. His

father, Edmund Kean, seems to have been a stage-carpenter;

his mother was Miss Ann Carey, daughter of George Savage

Carey, and grand-daughter of Henry Carey. [CAREY, HENRY, P. C. S.] George Savage Carey, who was born in 1743 and died in 1807, supported himself by delivering public

lectures interspersed with recitatives, songs, etc. He was the

author of numerous songs and nine dramatic pieces. Miss

Carey was an actress at minor theatres and with strolling

players and in London at the Haymarket, etc. She died in

1821; two papers on the comparison of British Standards of

Linear Measures; one paper entitled 'An Account of Ex-

periments made with an Invariable Pendulum belonging to

the Royal Society of London; a third on 'On the Construc-

tion and Adjustment of the New Standards of Weights and

Measures in the United Kingdom of Great Britain and Ireland.'
got little literary instruction. His theatrical education, however, commenced early; Miss Tidwell instructed him in her art, and his mother, as soon as she found that he might be made useful, took him with her in her occasional occupation of selling flowers and perfumery from door to door, the beauty and tact, her countrywomen esteemed, of the mother; she afterwards took him with her in her rambles with strolling players and showmen. Master Carey, as he was then called, was so clever, that once, when Miss Carey and her mother were to be entertained by Mr. Richardson (the Richardson so well-known for his annual exhibitions at Bartholomew Fair), Master Carey was required to give his recitations before George III. at the Castle, which he did in a manner that so delighted His Majesty that he was presented with a handsome present. He continued his performances, sometimes with his mother and sometimes alone, at small places of public amusement in London and the neighbourhood till about the age of sixteen, when he left her entirely, and joined a company of strollers in Scotland.

Kean's first performance of a complete character was that of Young Norval, in 'Douglas,' in Richardson's booth; his first engagement with a regular company was in 1804, when he made his appearance at Sheerness on Easter Monday, on which occasion he played George Barnwell and Harlequin in a pantomime which was still called 'The Devil," and whose salary was 15s. a week. From this time till 1814, when he made his first appearance at Drury Lane Theatre, London, his life was a series of the vicissitudes, struggles, and privations incident to the life of a country actor in England; in 1808 he came acquainted with Miss Chambers, an actress in the same company in which he had obtained an engagement at Gloucester. Maria Chambers, in July, 1808, became the wife of Edmund Kean, as he then called himself; and when she was near her accouchement with her first child they travelled together from Bristol to Swanscombe, about one hundred and fifty miles, with only four pounds to pay their expenses on the road. On the 15th of September, 1809, Howard Kean was born. In the winter of the same year they passed over to Ireland, and at Waterford Kean became acquainted with Sheridan Knowles, then an obscure actor, or rather a denizen of the stage, who, under the name of Archibald L. Le, or the Gipsy, which was performed at the Waterford theatre, and in which Kean played the chief character with great effect, and the drama was eminently successful. It has never been printed, but an analysis and extracts are given in the 'Life of Kean.' Charles Kean, the second son, was born at Waterford in 1810 or 1811.

Kean had a high opinion of his own powers, and in his country engagements always stipulated for the privilege of playing the first characters, as they are technically called, declaring that he would 'play second to no man except John Kenble.' On two different occasions when the managers, again, offered him a character inferior to those with which he was familiar, he refused, and when Betty, the Young Roscius, he disappeared till after Master Betty had gone away. One of Kean's best engagements was at Exeter, where his salary was 2l. a week, for which he not only played Edmund Kean, as he then called himself, but in the 'Fairy Feller,' but Harlequin in the usual pantomime and the monkey in the 'Perouse.'

While Kean was residing at Exeter, in 1813, he engaged to play four nights at Teignmouth; having completed his engagement, he had a benefit, on which occasion he played Rolla in 'Pizarro,' and then there was 'Chiron and Achilles,' in which his son Howard performed, and lastly there was a pantomime, in which he exhibited his usual grace and agility as Harlequin. On this occasion Mr. Drury, late head master of Harrow School, happened to be present, with his wife. On the following morning Mrs. Drury called to pay for the tickets, and Kean was much struck with Mr. Kean's performances, and intended to speak to Mr. Pascoe Grenfell, one of the Drury Lane Committee, in his favour. In November, 1815, while playing to a very thin audience at Dorchester, he observed a gentleman in the box who was very attentive to his performance, and who seemed to admire it, but who did not applaud. Kean saw that he was appreciated, and played his best. The gentleman was Mr. Arnold, managing director of the Theatre Royal, Drury Lane. On a subsequent morning at Drury Lane, Mr. Arnold engaged him provisionally on behalf of the Committee of Drury Lane Theatre, for three years, at a salary of eight, with a week to play for each seven years. A short time before Kean was seen by Mr. Arnold, Mr. Elliston had offered him an engagement at St. a week to play at the Olympic Theatre, in Wych-street, London, but the engagement had never been completed, and Kean thought no more about it. When he came to London however, and Elliston heard that he was to be brought out at Drury Lane, he claimed his man, appealed to Mr. Arnold, and threatened to appeal to the law, the consequence of which was that Kean was not brought on till the 26th of January 1814, poor Kean and his wife and child were almost famished, not having received a shilling of salary, except 5l. which were sent to him at Dorchester to pay their expenses to London. At length, Mr. Arnold at Westminster, and the play-bills of Drury Lane announced 'The Merchant of Venice,' 'Shylock by Mr. Kean, from the Exeter Theatre,' which was received with great applause, though thinly attended, but the applause was tumultuous; he repeated the character; the house was well filled, and his fame was thereupon established. On his first night 164l. were paid at the door; on the second, 239l.; after which the average was upwards of 600l. His performance of Othello on one occasion brought 678l. 18s. 6d. After his third performance of Shylock, Mr. Whitbread invited him to breakfast to complete his engagement for three years, at 80l., and 102l. a character. Immediately after the contract was signed Mr. Whitbread tore it to pieces in Kean's presence, and presented him with a sketch of a new engagement, by which the Drury Lane Company made Kean 25l. a week for half the year. And 15l. per week. Not long afterwards the Committee made him a present of 600l., and he received many valuable presents from individuals. Drury Lane Theatre was saved from ruin by this engagement, which had been suggested by Mr. Elliston, and rapidly advanced to a state of unexampled prosperity.

Kean's career of success, including a visit to America in 1820, was uninterrupted till his criminal connection with the parties of Stow and the 'Smithfield,' and the subsequent attacks of the newspapers. On the 17th of January, 1825, the action of Cox v. Kean was tried, and a verdict of 800l. damages pronounced against him. Some of the newspapers made a series of comments very detrimental to Kean's character. The public were exasperated against him, and he was driven from the stage of Drury Lane and afterwards from that of Edinburgh. After some time however he was allowed to go on with his plays in London, and he again attempted to reestablish himself in his former position, and therefore gladly accepted an invitation to pay a second visit to America. After an absence of two seasons in the United States Kean returned to London, having during the time not only acquired but saved a considerable sum. The London public had relinquished their animosity, but it was in vain. He had always, in the time of his prosperity, been a dissolute man, but he had now fallen into habits of almost constant intoxication. His constitution was broken up, his memory was impaired to such a degree that he could not study a new part, his alacrity of spirit was gone, and his performances were little to the people's taste. Even the tone and accent by which he had separated from Mrs. Kean after the trial with Alderman Cox, and allowed her 200l. a year; his mother was alive in 1822, and had from him an allowance of 60l. a year. His eldest son was born, 1821, and entered Eton College, and when Kean found that he was disposed to become an actor, he absurdlly quarrelled with him, and abandoned him, and the young man was obliged to take to the stage in order to obtain the means of living. Charles Kean was a year or two in America; after his return his father became reconciled to him, and in 1833 it was announced that Kean would play Othello, at Covent Garden Theatre, and that Charles Kean would visit the United States. In 1835 Kean struggled through the part as far as the speech 'Villain, be sure,' when his head sunk on his son's shoulder: he was borne off the stage, and his acting was at an end: the audience in kindness immediately left the theatre.

Kean lingered on at his residence at Richmond for a while, and before he died wrote to his wife to ask her 'to forget and forgive.' She immediately came to him, and attended him till his death, which took place a few weeks after. In his last illness his hair grew long, and his voice was quite of the same strength as when he was a young man. He was always a kind man, but his character was as turbulent as his temper; he was somewhat harsh and given to expressing his supposed, trust to the impulse of his feelings. He studied his characters much and anxiously. Frequently, after his

m and published in 1724 under the title of 'An Introduction to the true Astronomy, or Astronomical Lectures delivered at Oxford.'

In the 'Philosophical Transactions' for 1708 there are two papers by Keill. One is entitled 'A Discourse on the Cause of Attraction and other Physical Principles,' and the other, 'Of the Law of Centrifugal Force.' In the volume for 1713 there is a paper by him on 'The Newtonian Solution of the Problems of the Lunar Theory.' He also published 'Theoremata quaedam Infiniutim Materiar Divisibilissimae spectantia;' and one which is designated 'Observations on Mr. John Bernoulli's Remarks on the Inverse Problem of the Centrifugal Forces, with a comparison of the Derivations of the Fundamental Equations of both of these were published in 'te Transactions' for 1714.

Dr. Keill died Sept. 1, 1721, in the fiftieth year of his age.

A writer in the 'Acta Eruditorum' having, in a notice of Newton's Treatise on the Quadrature of Curves, stated that the English philosopher had taken the Method of Fluxions from Leibnitz, the indignation of Newton's friends was excited; and in the paper on the Law of Attraction, &c., which, as above mentioned, was published in the 'Philosophical Transactions,' Keill formally asserted the claims of Newton to priority in the discovery. This paper gave offence to Leibnitz, and in a letter to the Secretary of the Royal Society, required that Keill should be compelled to retract his assertion: this was not done; and Keill, in a letter to the Secretary, detailed the enormities of what he had stated. [Cammpanum Eptolenicu, P. C.]

Dr. Keill was not fortunate on another occasion. Entering into the war of problems which was at that time carried on by different schools of mathematicians, he took part on the side of Newton. On an occasion of an affair of the latter year, he somewhat presumptuously challenged John Bernoulli to determine the path of a body when projected in a medium which exercised on it a resistance varying with the square of the velocity: the challenge was accepted, and before Keill could complete his own solution, Bernoulli announced that he had succeeded in obtaining one: the former was, in consequence, compelled to endure in silence the reproach which a foreign mathematician did not fail, ungrudgingly, to administer.

An edition, in Latin, of Dr. Keill's principal works was published at Milan in 1742, in 4to., under the title 'Introductio ad veram Physicam et Astronomiam,' &c. From the 'Philosophical Transactions.'

Key Islands are a group of islands of considerable extent in the Indian Archipelago, situated between 5° 20' and 6° 30' S. lat., and between 132° 30' and 133° 40' E. long. Three islands are rather large, and called Great Key, Little Key, and Middle Key. The latter, however, is only a group of one is not known, as they are rarely visited by Europeans.

They rise to a moderate elevation above the sea, and all the heights are overgrown with forest-trees, which constitute one of the principal features of these islands. The aboriginals are engaged in ship-building to a considerable extent; a great number of country vessels that ply between Borneo and Timor on the east, and the coast of Papua on the west, are built on this island, especially on the island of Dhoula, which lies on the western coast of Little Key. These vessels are stoutly built, of excellent timber, and are sold for a moderate price.

There is no town at Dhoula, but the harbour is large and surrounded by numerous villages. The native population of the island of Banda obtain from this place an abundant supply of provisions, especially cattle. The European and Indian goods obtained by the traders are usually disposed of by the inhabitants to the Araro Islands [Sunda Island, vol. iii. p. 291] from the harbour of Elie, which lies on the eastern shores of Great Key. This place is also remarkable for the manufacture of earthenware, which is extensively prized by the inhabitants of all the neighbouring groups, and preferred to all other utensils of that description. Many of the inhabitants are occupied with fishing and trapping; and there has been a general reduction in the number of this fishery. Very little is known of the inhabitants of this group, except that a part of them have embraced the Islamic. This is especially stated of the inhabitants of Elie. It is further stated, that the population of Dhoula and of Elie and Ceram have settled among them, and perhaps it may be attributable to these foreigners that the native population has attained a higher degree of civilization than their neighbours.

F. C. S., No. 103.
They are stated to be more friendly to foreigners, and to be more honest in their dealings. (Kolff, Reise durch den weinig behenden südlichen Molukken Archipel.)

KILIAN was born at Augsburg in 1579, and was educated as an engraver by his stepfather Dominik Custos. He studied also the works of Tintoretto and Paul Veronese at Venice, after which he engraved several prints which were sold at Augsburg and obtained him the reputation of one of the best engravers of his age; his style of drawing was however not quite correct, and was somewhat mannered. He died at Augsburg in 1585. Locus had great command of the graver, and has been known to execute two portraits in a single week; his works are very numerous.

WOLFGANG KILIAN was born at Augsburg in 1581, was also instructed in engraving by his stepfather Custos, and, as his brother, studied also in Venice. In September there produced are the most carefully executed works of his. He was latterly compelled by the wants of a numerous family and hard times (it was during the Thirty YearsWar) to look more particularly the quality of his work, and his remarkably executed chief portraits. His greatest work is the Celebrities of the Westphalian Peace in Augsburg in 1649, in two sheets, after a picture by Sandrart; it contains about five hundred portraits, all finely executed.

BARTOLOMÆUS KILIAN, the third son of Wolfgang, was born at Augsburg in 1590, and was first instructed in engraving by his father, who afterwards by his son's request sent him to study with Matthias Merian, a celebrated engraver at Frankfurt on the Main. From Frankfurt Bartolomaeus went to Paris, where he remained a few years, maintaining himself by his own labour; and he returned to Augsburg in 1620, where he was very active in laying the ground work for the etching-trade. Sandrart terms him a born engraver: his works are very numerous, but are chiefly portraits. He died at Augsburg in 1690.

PHILIPP ANDREAS KILIAN, the son of Georg Kilian, closely related to the above, was born at Augsburg in 1714, and was taught engraving by G. M. Preiseler in Nürnberg. He studied also in the Netherlands and in various parts of Germany, and became one of the most distinguished artists of his time; besides his technical skill in the use of the graver he had a good taste and was a correct draftsman, but his execution was somewhat peculiar and monotonous. In 1744 Andreas engravings were sold in Poland and elsewhere, in which he is considered to have been a very fine artist, and he is considered to have been one of the most famous of his time. He was invited to reside in Dresden, but Kilian preferred his native city. He however visited Dresden in 1751 for the purpose of conducting the execution of his productions after the manner of the celebrated painter, the Dresden Gallery. Recueil d'Estampes après l'appareil plus célèbres Tableaux de la Galerie de Dresden. The completion of this collection was interrupted by the breaking out of the Seven Years' war, in 1756. Upon the cessation of this work he commenced an extensive series of illustrations of the Bible in quarto, which he accomplished by the assistance of various other artists, to the number of 130 prints, but they are not among his best works. He executed many portraits; two of the best of which are the emperor Francis I. and Maria Theresa, after G. von Mytens. Three days before his death he was engaged on a portrait of Pope Clement XIII., which he was very nearly completed. He died in 1759.

Heineken enumerates twenty-one members of this family, of whom eighteen were artists, and fourteen of these engravers. (Heineken, Ein Artikel von Künstlern und Künstleurs.) KILIGREW, THOMAS, a younger son of Sir Robert Killigrew, was born at Hanworth in Middlesex, in 1611. He travelled in his youth, was present at an exorcism of the nuns of Loudun, was appointed a page of honour to Charles I., and afterwards a secretary. After the fall of the court he was officiating one of the queen's maids of honour. His courage and licentious wit qualified him peculiarly for securing the favour of his master, who in spite of the remonstrances of his wiser counsellors, sent him to Paris, where he made his chief living by raising money for himself, and was expelled with disgrace. On the Restoration Killigrew became groom of the bedchamber, and enjoyed an intimacy and influence with the king which the first men in the nation were unable to obtain. He has sometimes been said to have been officially appointed to be the royal jester; but for this assertion there is no ground, for the king had no jester, but professional jesters would in any other reign have been allowed to take. He died at Whitehall in 1682. He wrote eleven plays, of which the first two were printed in 1641, and the whole collection in a folio volume in 1649. They do not by any means justify his reputation as a wit. A sufficient specimen of them is furnished by the comedy of 'The Parson's Wedding,' reprinted in Dodgson's 'Old Plays.' Killigrew's older brother, Sir Walter Killigrew, a spectable person, was the author of four or five plays, and of two volumes of moral reflections. He died in 1698. The youngest brother, Dr. Henry Killigrew, wrote a tragedy in his youth, took holy orders, and lived several performances. He was Master of the Savoy at his death, which took place after Sir William's. Dryden's fine elegy on Mrs. Anne Kilgrew celebrates a daughter of Dr. Henry.

KING, PETER, LORD, was born in 1669, at Exeter, in which town his father, Mr. Jerome King, carried on the business of a grocer and salter, though said to be descendend from a gentry family. In September, 1680, he bought up his son, and the future Lord Chancellor of Great Britain served for some years in his father's shop. It was probably his relationship to the celebrated John Locke, who at that time was living under the same roof, and by his father's help, that brought him into friendship with several of the leading men in the town, and brought him to notice of Lord Oxford, who was then compehended in the scheme of the national establishment. The Second Part, occupied with the Worship of the primitive church, followed soon after. This work excited much attention, and, besides a correspondence between Mr. Edward Elsy and the author, which was published in octavo, by the former, in 1694, drew forth, on its being reprinted in 1712, during the discussions on the Schism Bill, 'An Impeial View and Censure of the Mistrakes propounded for the obtaining power of Presbyters in a celebrated Book entitled An Enquiry, &c.' in an appendix to 'The Invalidity of the Disenting Ministry,' and also 'An Original Draught of the Constitution of the Presbyterian Church as an Enquiry,' &c., 8vo., Lond. 1717. Both these answers were professed to be 'by a Presbyter of the Church of England,' and the latter at least is known to be the production of a non-conformist. In the right hand of the book is the title-page pasted, and at the back of the book is the signature of the person who have been often reprinted after the work was published in 1703, in London, in 1714, a few months after the accession of George I., Sir Peter King was made Chief Justice of the Common Pleas; and he was sworn a privy counsellor in April of the following year. After the fall of the Duke of York, in 1668, he was, in June, 1725, appointed Lord Chancellor, and was at the same time raised to the peerage as Baron King of Ockham in the county of Surrey. Lord King however did not long retain this place, for in 1727 he Hastings, member for Hastings, in 1725, appointed Lord Chancellor, and was at the same time raised to the peerage as Baron King of Ockham in the county of Surrey.
fessional learning necessary for his new duties. He resigned the seals on the 28th of November, 1793, and died at his seat of Ockham on the 22nd of July, 1794. By his wife Anne, daughter of Richard Seys, of Boverton in Glamorgan-shire, Esq., he left four sons, who all inherited the title in succession, and from the youngest of whom the present peer (created in 1838) is descended. (Biographia Britannica.)

KING'S COLLEGE, CAMBRIDGE, was originally a school, a sector and twelve fellows, founded by King Henry VI. in 1441; but in 1443 he changed its form, and endowed it for a provost, seventy fellows and scholars, three chaplains, six clerks, sixteen choristers, and a music-master (with thirty-four servants to accommodate them); also twelve servitors for the senior fellows, and six poor scholars.

Eton College was founded by Henry VI. in 1441, and when he re-founded King's College in 1448 he placed it in immediate connection with Eton College for the supply of its scholars, each of whom at the end of three years from the day of his admission to King's College, is either elected a fellow or is no longer a member of the College. For the last twenty years the vacancies at King's College have been on an average less than four in the year. The process of electing the scholars on the foundation at Eton College for admission to King's College is described under Eton College, p. C.S.

The Society, as at present constituted, consists of a provost, a vice-provost, a dean of divinity, two deans of arts, three bursars, a tutor and classical lecturer, a morning reader, a divinity lecturer, a lecturer in mathematics, a conductor, and an organic scholar of art, and one of the unconditional grammarian.

A public examination takes place in the Hall of King's College at the end of Easter Term, when the students are divided into classes according to their respective degrees of precedence; and books, to the value of 10l. and stamped with the College arms, are apportioned to the three first scholars in the classical and mathematical examination; the three scholars who are highest in the divinity examination receive prizes of 10l. apiece, and portions from the yearly interest of 600l. left for that purpose.

There are also other annual prizes which have been specially provided for, either by the College or by bequests of individuals,—20l. to be equally divided between such scholars as have in the course of the year been most distinguished for learning and regularity of conduct; 6l. to such scholar or scholars as shall be adjudged to have deserved well by application to study and good conduct; 20l. prizes for Latin declamations; two 6l. prizes for English declamations: and one 6l. prize for the best translation of an English subject into Greek and Latin.

King's College has some peculiar privileges. The provost has absolute authority within the precincts; the undergraduates (under certain restrictions) are exempt, within the limits of their own college, from the influence ponderous of the Senate and other University officers; they keep no public exercises in the University schools, nor are in any way required to be examined by the University for their degree of B.A.

By the Gloucester Hall, the only colleges at which undergraduates can be elected fellows; in King's College, however, they are obliged to take the degrees both of B.A. and M.A. in the University when of sufficient standing, otherwise they are not entitled to the full proportion of their dividends.

There are thirty-six church livings in the patronage of the College,—two in Cambridge, two in Devonshire, one in Dorsetshire, one in Essex, four in Hampshire, two in Hertfordshire, one in Lancashire, two in Lincolnshire, one in Middlesex, five in Norfolk, one in Northamptonshire, six in Suffolk, five in Surrey, one in Sussex, one in Warwickshire, and two in Wiltshire.

The original buildings of King's College consisted of the present chapel and a quadrangular court to the north of it, built of stone, 120 feet in length by 90 feet in breadth. The building was commenced in 1446 and completed in 1468, when some parts had decayed, it was determined that a large quadrangle should be erected to the south of the chapel; Gibbs was appointed the architect. (Grene, Jams, P.C.) The building was commenced in 1527, and completed in 1610, when the quadrangle the Fellows' Building, or Grecian Building, as it is commonly called. Nothing more was done till July 12, 1824, when the new buildings were commenced by W. Wilkins, and completed by A. W. N. Pugin. (Wren, P.C.)

The quadrangle is 280 feet in length by 270 feet in breadth, and consists of the Hall, Library, Chapel, and apartments for the fellows and scholars. It is separated from Trumpington Street on the east by a screen, in the centre of which is the entrance-gateway bearing a domed tassel. The Hall, on the south side of the quadrangle, is 102 feet long, 36 feet wide, and 45 feet high, a noble room with a beautiful timber roof, similar to that of the Hall in London, the arches terminating in mantlets and adorned in early 15th and early 16th century work. There is a music-galley at each end, and an elegant screen at the west end. The roof is surmounted by two stone turrets, with minster-towers, and twelve fellows, founded by King Henry VI. in 1441; but in 1443 he changed its form, and endowed it for a provost, seventy fellows and scholars, three chaplains, six clerks, sixteen choristers, and a music-master (with thirty-four servants to accommodate them); also twelve servitors for the senior fellows, and six poor scholars.

Eton College was founded by Henry VI. in 1441, and when he re-founded King's College in 1448 he placed it in immediate connection with Eton College for the supply of its scholars, each of whom at the end of three years from the day of his admission to King's College, is either elected a fellow or is no longer a member of the College. For the last twenty years the vacancies at King's College have been on an average less than four in the year. The process of electing the scholars on the foundation at Eton College for admission to King's College is described under Eton College, p. C.S.

The first architect was Nicholas Cloos, and the first stone was laid in September, 1447. The walls were erected to a considerable height, but little progress was made during the latter part of the reign of King Henry VI. The building was continued during those of his successors, till in May, 1508, Henry VII. gave 5000l. towards the completion of the building, and his executors, in 1513, under a power conferred by his will, gave a further sum of 5000l. for the same purpose. In July, 1516, the exterior, including the roofs, was complete. In 1526 an agreement was made for the painted windows. The screen and stalls were not finished till about 1534.

This magnificent structure is, 316 feet in length, 84 feet in width, and 90 feet in height to the top of the battlements; the height to the top of each of the four corner turrets is 1463 feet. The interior length is 201 feet, the width 424 feet, and the height 78 feet. The exterior walls and the two roofs are supported by eleven vast buttresses on each side and four towers at the angles, and there are eight small chapels originally constructed for chantries, on each side between the buttresses. The exterior appearance of the chapel, with its towers and buttresses, lofty windows, pinnacles, and pierced battlements, is as beautiful as it is grand and imposing. In the interior the vast stone roof unsupported by pillared arches is one of the wonders of arcatectural skill. Eleven principal ribs spring from the buttresses on each side, forming an arch somewhat flattened at the centre, and which, in the whole, weigh a ton, hang as pendants, and appear to be the bones of the arches. The pendant are carved with alternate roses and pomegranates, the principal ribs are connected with each other and with the whole roof, forming a whole roof of the lightest and most richly carved fan-tracery, producing an effect of the strongest admiration and astonishment. It is stated that the stone pendants are not really key-stones, but might be safely taken away, together with the walls between the buttresses and the four towers, leaving, as it were, the skeleton of the building to support the roofs. The exterior roof, of light materials, is separated from the interior stone roof by a space of about six feet.

The great east window and twenty-four-side windows, each nearly 50 feet high, are filled with painted glass, and form a series of scriptural pictures of exceeding beauty. The great east window also contains plate glass, and stained glass, of national light. The whole of the interior, with its screen in the centre, its walls of carved stone, and its stalls and tabernacle-work of carved oak, is worthy of the highest admiration. (Lyons, Cambridge; Wason, Memorabilia Cantabrigia; Cambridge University Calendar, 1846; Cambridge Guide, 1857.)

KING'S COLLEGE, LONDON, an institution established in October, 1829, and incorporated by royal charter 14th August, 1830, as a college for the general education of youth, in which college, says the charter, 'the various branches of literature and science are taught, and also the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland.'
KIN

140

KIV

The charter precludes, in the following terms, persons who are not the Established Church from holding office in the college: 'Provided always, that no person who is not a member of the United Church of England and Ireland, as by law established, shall be competent to act as a governor by right of property, or to be elected governor, or be eligible as a member of the council, or to fill any office in the college, except only the Professors of Oriental Literature and Modern Languages.' King's College is not to be exclusive of the Church of England and institution; and in this respect only does it mainly differ from University College, London, which was established two or three years earlier, with the design of affording the advantages of a university to persons not excluded wholly or partially from the universities of Oxford and Cambridge, on account of their not being members of the Church of England. [UNIVERSITY COLLEGE, LONDON, P.C.] The visitor appointed by the charter is the Archbishop of Canterbury for the time being, and the governors, ex-officio, are the Lord Chancellor, the Archbishop of York, the Bishop of London, the Lord Chief Justice of the Queen's Bench, the Secretary of State for the Home Department, the Speaker of the House of Commons, the Lord Mayor of London, and the Deans of St. Paul's and Westminster. There are also life-governors, but their number is limited to eight. The council consists of the governors and the treasurer, and a number of others. The proprietors are those who hold shares or have been donors to the amount of 50£. Proprietors are entitled for each donation of 50£ or upwards, or for two years' residence, to nominate a student, either for general or medical education in the college, and one pupil in the school, or two pupils in the school. The chief officer of the college is the Principal.

The college was opened in 1831. There are five departments: the Department of General Literature and Science; the Department of Applied Sciences; the Medical Department; the Theological Department; and the School.

In the Department of General Literature and Science, matriculated students, not under the age of 16 (except in special cases), are admitted to a regular and prescribed course of general study, but are allowed to attend any particular lectures not prescribed in that course. Occasional students are admitted, who attend any particular course or courses of lectures given in the college. There are apartments fitted up in the college for a limited number of students not under eighteen years of age, who are required to dine in hall. The prescribed course of study comprises religious instruction according to the principles of the Established Church; the Greek and Latin classics; mathematics; English literature and history. The course of religious instruction is given by the Principal and the chaplain, and consists of lectures and weekly examinations. All matriculated students are entitled to sit for chapel daily, and a register of their attendance is kept. The academical year consists of the Michaelmas, Lent, and Easter Terms. Examinations take place at the end of the Michaelmas and Easter Terms. The students are required to pass examinations in order to proceed to the next year, and at the close of the academical year there is another examination, followed by a public distribution of prizes. After completing three years' course, those students who have passed through it with credit, and have also attended three extra courses of lectures, are entitled to the diploma of 'Associate of King's College.' There are Professors of Classical Literature, Mathematics, English Literature and Modern History, Natural Philosophy and Astronomy, Experimental Philosophy, English Law and Jurisprudence, Political Economy, Geology, Chemistry, Botany, Zoology, Fine Arts, Hebrew Language and Literature, Oriental Languages, and German. There is a Club to which German, Italian, and Spanish languages, respectively, and also of Vocal Music, are taught. The College of Surgeons and the Society of Apothecaries; and the Occasional Students attend only the lectures of parts of the principal. By King's College Hospital, some of the officers and all the dressers are selected from the pupils of the College.

The Theological Department was instituted in 1846, but has not yet been opened. In 1848, it is intended that students of King's College who shall have passed three years in the department of general literature and science, and who have received a diploma; for graduates of Oxford and Cambridge; and for all persons who shall be approved by the Principal and recommended by a bishop. The course of study will be for six terms (two years), and the fees will amount to 80£. It is intended to employ the students as district visitors, and to teach in the methods of conducting schools. They are also to be taught congregational singing. On the completion of the course of study the Principal is to be empowered to grant certificates of attainment and good conduct, which certificates are to be exhibited to the Bishop on application for holy orders.

There are libraries attached to the several departments, and also a general library.

The School Department is for youths from nine to sixteen years of age, and the course of instruction comprises Greek, Latin, French, mathematics, writing, arithmetic, book-keeping, history, geography, and English literature; and for the first three classes German. There are also extramural lessons. The terms are eighteen guineas annually, exclusive of books and stationery, with an entrance fee of one guinea. In 1845 the number of students and pupils was as follows:—

There are several small endowments by benefactors of the college. The Worsley endowment is for the instruction in every department of two scholars, to whom a stipend of 25£ is paid, and who, on the completion of their studies, are sent out as missionaries; and there are several others for prizes for proficiency and good conduct. These scholarships have been founded for matriculated medical students. The Master and Fellows of Magdalene College, Cambridge, have, on the death of Mr. Mead, given a sum of 5,000£, so that the sum of 5,000£. Mr. Marsden left to the College a valuable library of about 3,000 volumes, chiefly in Oriental literature and philology.

King's College forms the eastern wing of Somerset House, which was originally intended to give a part of that natural division which gives the name of the Strand, or the Queen's Walk, from the east of the Caspian Sea, between 35° and 45° N. lat., and between 45° and 59° E. long. Its political boundary is not distinctly determined, as it mostly runs through deserts, inhabited by nomadic tribes, which only nominally recognize the sovereignty of the Khans, and pay no obedience to his orders. Only on the east, the boundary between Khiva and Bokhara is more exactly fixed. It traverses the river Oxus a few miles north of Gurgaran; and so the students who are to be sent thence to the Caspian. The Caspian constitutes its western boundary. On the south of Khiva is the desert called Dushan Caves, and
through it lies the boundary-line separating Khyya from Persia and Merv. The authority of the Khan of Khyya may extend over a core 2000 feet above an level of the miles, or over 30,000 more than the extent of the British empire in Europe.

**Surface and Soil.**—We begin with the wide intakes which lie between the Caspian and the Sea of Aral. Between 44° and 45° N. lat., an extensive promontory projects into the Caspian. It is called Manoghalak, and consists of a mountain-block, divided into three chains, which according to an estimate made by the southern town of the country, is 44° N. lat. (north of 43°), a distance of about 150 miles. Its western boundary may be marked by a line drawn from the town of Khyya to that of Kana Oorgentagh, which falls short of a hundred miles. The mean distance of the two line does not exceed 30 miles, and the area of this tract falls short of 4000 square miles. It is not equal to double the extent of Norfolk. This tract is thinly inhabited, and produces almost every kind of grain in abundance. Its fertility is properly not derived from the soil, which, where it is beyond the reach of irrigation, consists of a hard loam, impregnated with salt, and nearly without vegetation. But the whole region is traversed by so many canals, that it resembles a net. The water is drawn from the Oxus, and runs with a perceptible current to the west and north-west, where the canals terminate in a series of lakes and a foot of sand-hills which divide Khyya Proper from the Desert of the Trachemene.

This description however applies only to the southern part of the region, or that which lies between 41° and 40° N. lat.; that which lies between 44° and 45° N. lat. is called the Desert of the Trachemene, which is entirely covered by the sand of its beds, contains very little land fit for agricultural purposes. It is annually inundated by the river, and mostly overgrown with reefs and rushes, but there are considerable tracts which serve as pasture-ground for cattle, which is of great importance, as the southern country has no meadow land or pastures.

On the sea of the river Oxus the cultivable ground is of small extent. About 42° 20' N. lat. begins a tract of higher ground about two miles from the river, which runs parallel to it for about forty miles to the south-east. This ridge is about four miles wide, and is called Sirkhodsholi; it rises about 600 feet above its base, and descends gradually eastward into the Desert of Kizil Cum. Where this ridge terminates (40° 35'), the cultivable land probably extends to five or six miles from the banks of the Oxus, and here also there are several smaller canals.

**River and Canals.**—The river Oxus, whose modern name is Amoo Deria or Ghion, originates in the elevated mountain region which divides Persia and Turkish Turkestan, and passes through Chinese and Persia, and which goes by the name of Bolor Toor. There it issues from a lake, called Sir-i-kol, which is about fourteen miles long from east to west, with an average breadth of one mile, and near 723 feet above the level of the Caspian sea. Sir-i-kol mentions the fact of its rising in a lake, which was supposed to be a bungalow, but while this lake was recently discovered by Lieutenant Wood. (OXUS, P. C.; TURKISTAN, P. C., p. 411.)

This lake is 15,600 feet above the sea-level, and on three sides bordered by hills, about 500 feet above its level, whilst along its southern bank they rise into mountains 3500 feet above the lake or 13,000 above the sea, and are covered with perpetual snow, from which never-dying source the lake is supplied. At Isar, about eighty miles from the place where the river leaves the lake, its surface is only 10,000 feet above the sea-level, and it continues to descend rapidly in traversing the mountain region, where it is called Panj. The mountains by which its course is enclosed, terminate at Kihl Chap, where the Oxus is joined by its first great tributary, the Kucha, or river of Badakshan. Immediately above and below this place the river is corridors in summer. Higher up it is less dependent on account of the rapidity of the current, nor lower down on account of the depth and the great volume of water, for in these parts it is joined by several large tributaries from the south and north, where it swells out into rivers from 300 to 400 yards wide, and runs about three miles and a half an hour. It certainly could be navigated in these parts, but it does not suppose such a purpose. The waters are led into several canals to irrigate the pastures of the region.
From Kiblah Chap its general course is to the west for about two hundred miles, through a country where cultivated tracts alternate with sandy deserts of moderate extent. After having passed the meridian of Balkh (6th ° E. long.), its course deviates westward, and, as a result of the current it continues to the boundary-line of Khyrva, watering the adjacent country for more than two hundred and fifty miles. The country which it traverses is unfit for cultivation, except in the immediate vicinity of the river, where the fields are irrigated from the river. It is here still a rapid stream and navigable, but not far from the boundary-line between Bokhara and Khvrva rapids are said to exist, which are full of rocks, and during low-water dangerous tides passed by boats. In this middle part of its course the Oxus is not joined by any permanent stream.

The lower course of the Oxus, from the above-mentioned rapids, above the Bokharan fortress of Charchui, to its mouth in the Sea of Aral, probably exceeds five hundred miles in length, so that its whole course amounts to nearly thirteen hundred miles. It therefore is larger than any river in Europe, except the Volga. Nearly two hundred miles of its lower course lie through a desert country, similar to that traversed by it in its middle course, but there does not occur any obstruction to navigation, and it is navigable. The river rises near 41° N., and traverses it in one bed as far north as 42° 30', or upwards of a hundred miles. It is turned by the northern extremity of Mount Shikhodshili to the west, and a few miles lower down the Tartar, and then two arms, of which the Lowdahn, continues to run in a western direction about fifty miles, when it falls into Lake Ak-Chegenank. This lake is situated near the base of the table-land of Oost-oort, and at a distance of two hundred miles from the Sea of Aral. It extends about thirty miles from east to west. On its northern side begins a deep depression, which extends along the base of the table-land to the Sea of Aral, and has a mean breadth of fifteen miles. It is entirely in water every winter, when the level of the Oxus is lowest, but only to a moderate depth. It is overgrown with reeds, rushes and other aquatic plants, with the exception of a comparatively narrow strip, which is surrounded by a broad, and whence the perceptible current runs to the Sea of Aral. The water of this swampy tract is sweet. Nearly halfway between the place where the Lowdahn branches off from the Oxus and its influx into Lake Ak-Chegenank, it sends off a branch to the south-west, which is called Szarkkran, and passes near the town of Kana (Old) Oorgondsh, but its farther course is not known. At Kana Oorgondsh it was, in September, 1842, a river about sixty or seventy feet wide, and two feet deep.

From the place where the Lowdahn branches off the main stream of the Oxus runs due north about ten or twelve miles, and then sends off an arm to the north-east, called Kook-shak, which extends about forty miles more than this branch, called Dunkara. From this lake a swampy depression similar to that of Lake Ak-Chegenank is stated to extend to the Aral; but this fact rests only on the information of the native, and is not confirmed by the observations of the Oxus again north-west, and sends a branch, called Kara-Beili, to Lake Dunkara, and two smaller ones, Kint Chargun and Koko-Daria, to the depression north of Lake Ak-Chegenank. Farther on, at a distance of about thirty miles, the Oxus divides itself into two arms, of which the smaller and western, called Takhly Daria, reaches the Sea of Aral without dividing any farther, but the eastern, Uria Daria, enters the sea by two arms, of which the eastern is known as Kankar Daria.

The Sea of Aral, into which the Oxus debouches, is a great inland lake. [AR AL.] It contains numerous islands, and some of them are inhabited and cultivated. The largest, called Tokmak-Ata, lies opposite the mouths of the Oxus, and is about twenty miles long. It is partly cultivated and partly overgrown with wood. The distance from the shore is about fourteen miles; and it is stated that when the water of the sea is low a man on horseback can pass through this strait, so shallow is it.

The Aral is not mentioned by the classical writers; were they unacquainted with this sea? or did it then consist of two parts? The moderns have maintained the latter opinion, and it has been asked, over which part of the isthmus lying between the two seas, the strait passed, which until that time had been the case direction of the Aral and inundated 46° 30', as in these parts the isthmus is occupied by the table-land of the Oost-oort, in which no depression of such a description occurs as would be required to form a wide and deep strait. The Russian surveys of the Caspian have made us acquainted with its eastern shores and the countries immediately adjacent to them. The hills which skirt the shores are, as already observed, interrupted at three places. But the two southern, and the northern, or the Tashkent, branch, has a distance from 300 to 400 miles from the southern shores of the Sea of Aral, and it is hardly probable that a strait of such a length could have passed through the country without leaving indelible traces; but such traces have not been found.

The northern depression above noticed, which opens into the Caspian, with the extensive lagoon of Kara Bogus, may have formed a strait, for its soil consists of such sand, as is left behind wherefore the sea water has not penetrated. It is also of considerable width, except towards the eastern extremity, west of Kana Oorgendsh, where it is only a few miles across. In these parts it appears rather to have formed the bed of a river than the receptacle of a strait. This leads us to another more complicated question. The ancient authors, who mention the Oxus, state that it flowed into the Caspian Sea, and the Arabic geographers of the middle ages, who were better acquainted with these countries than the ancients, hold the same opinion; it can therefore hardly be doubted that it was so. Arrian, whose authority is the best of all, distinctly states that it flowed into the Caspian Sea (Arab. 32). But where did the river which formed the Caspian Sea? It is certain that it did not flow into the Caspian Sea, when the Oxus had passed the Gulf of Khyrva, or Ashab Beyur, north of 39° N. lat., which is only one degree farther north than the place assigned to it by Arrian. It is probable that the Oxus did not flow into the Sea of Aral, but that it reached the sea by the middle opening, and flowed into Bukan Bay. But Alexander von Humboldt is of opinion that historical facts prove that, as late as A.D. 1500, the Oxus flowed into the Caspian Sea. The most decisive proof he finds in the ‘Theatrum Orbis Terrarum’ of Ortelius (1570), where an account and map of Russia and Tartary are found, which both previously (1562) had been published by Abraham Ortelius, agent of the Russia Company, who was sent to establish a commercial intercourse with central Asia by the way of the White Sea and Moskow. The title of Jenkin’s work is, ‘Rusiae, Mogolicae, Turciae, et Persiae Novissima, et accuratissima Descriptio.’

In this map the Oxus is laid down as falling into a large arm of the Caspian at 41° N. lat. This is evidently the lagoon of the Kara Bogus, but it appears that at the time of his travels (1559) the lagoon advanced much farther eastwards, which change may have been produced by a change in the level of the Caspian. In his account Jenkinson states that the water of the Oxus no longer reached the bay as it formerly did, and he attributes this change to the great volume of water which was drained from the river to irrigate the adjacent countries. But Oorgendsh was at this time a large country on the Oxus, with a large, and from what has been said, gable at that place. In fact, he embarked here, and ascended it to the vicinity of Bokhara. In the history of Abul Ghazi, it is stated that in 1575 the Oxus turned to the northward, and began to flow into the Oxus again north-west, and sends a branch, called Kara-Beili, to Lake Dunkara, and two smaller ones, Kint Chargun and Koko-Daria, to the depression north of Lake Ak-Chegenank. Farther on, at a distance of about thirty miles, the Oxus divides itself into two arms, of which the smaller and western, called Takhly Daria, reaches the Sea of Aral without dividing any farther, but the eastern, Uria Daria, enters the sea by two arms, of which the eastern is known as Kankar Daria.

A river like the Oxus, traversing such a level country as Khyrva, must be subject to frequent and great changes in its course. The river, like the Nile, brings down during the freshets a great quantity of detritus; but, unlike the deposit which the Nile leaves on the field at its mouth, the desert bed, the sandy matter contained in the waters of the Oxus diminishes the fertility of the soil. To prevent inundations the banks of the river and of the larger canals have been covered with sand. Above the level of 22° 30' the detritus is thus confined to their beds, and it leaves there a thick layer of mud mixed up with sand. The canals must annually be cleansed, and this is a laborious work. In spite of the enormous cost and the labor which has been necessary for this, the cultivation of the country surrounding Oorgendsh was then converted into a desert. Since that time this place has presented only ruins to the travelers who visited it; no river has been found in its vicinity in the last three centuries. But it would appear that in the last fifteen years the river has made some efforts to occupy its old bed. Several statements tend to prove it, and Bashiter found, in Sept. 1842, that the Szarkrak, near Kana Oorgendsh was from sixty to seventy feet wide, and two feet deep, and that the place, which was formerly uninhabited, had again been settled, and contained a population of 1000.
in this inundation. The level of the river is highest from May to July, and then its waters are very turbulent; but in the remainder of the year they are clear and well-tasted. It runs with a considerable current, at least two miles an hour. Its depth varies between six and ten feet. It must be much navigated, as it is stated that there are more than a thousand vessels employed in its transportation.

No country in the world has so many canals as Khvya. The number of the larger canals is stated to exceed twenty. In the southern districts they run westward to the beach; in the northern one, northward to the sea. They are connected with each other, and their length is considerable; that of Shwat, which is the largest, is at least seventy miles long. From these larger canals others of minor dimensions branch off and water the country to the distance of twenty miles. The canal of Palwan has twelve such lateral canals, of which one-fourth exceed twenty miles in length and about six are more than fifteen miles long. The water of these canals is brought to the fields by ditches. During the fresher a considerable current runs through the canals, and even at other seasons it is perceptible. The canals are still more navigable than the Oxus itself.

Climate.—The climate partakes of that excess of cold and heat which is not uncommon in the climate of large deserts. Though the thermometer does not rise much above freezing, the temperature is not sea-level in January. The summer is long, and in May is very hot. The winter is short, and the thermometer does not fall below freezing. It is a dry climate, and the summers are dry; rains fall rarely, but gales are frequent. Frost is common in October, and frequent in the spring. The temperature of the air is low in the south, and high in the north. The climate is a little too dry for the cultivation of the vine, but it is warm enough for it.

Production.—Agriculture is attended to with great care and industry; sometimes the fields are ploughed seven times. Great attention is paid to the preparation of manure. The crops are rice, wheat, barley, millet, sesame, cotton, jute, hemp, and clover; in the gardens, melons and water-melons, pumpkins, carrots, turnips, peas, onions, potatoes, and cucumbers; in the orchards, mulberries for rearing the silk-worm, apricots, apples, pears, plums, cherries, and vine, also currants. The fruits are not distinguished by flavour, except the melons and water-melons. On the banks of the canals and ditches are fruits of the most delicious kind; the melons and water-melons are only found on the eastern banks of the Oxus. In the lower region a plant grows wild, whose roots, moricha, are used in dyeing.

The horses of the Truchmenes are very beautiful, and held in great estimation, especially those which are called argamaks. Common horses are brought to Khvya by the Kirghiz. Many camels are kept, even by the poorer people, and also asses. Few cattle are reared, on account of the want of meadows, except by the Karakalpakes, who import cows and oxen into the cultivated region. Sheep are reared by the Truchmenes, or imported from Bokhara, on account of the fleece of the Kirghiz import a considerable number for slaughtering. Fowls are numerous; but turkeys, geese, and ducks, are only kept by the khan. Water-fowl are numerous in the delta, but not in the desert. Of wild animals there is little to be seen; bears, wolves, foxes, wild cats, jackals, hares, wild goats, deer, and wild hogs, mostly in the delta, where also the tiger is sometimes met with. Fish abound in the lakes, river, and Sea of Aral. Bears and wolves do not abound. Turtles and crayfish abound. Silk-worms are reared to a considerable extent.

Gold and copper are said to exist in the Shikhodshili mountains; but they are not worked. Of the woods there are stone for building, lime, pine, cypress, salt, and sulphur.

Population and Inhabitants.—The whole population is estimated at 2,000,000, of which one-fourth are stated to be sword-armed. Of the whole, about 125 persons live on a square mile, which does not appear to be an over-estimate, as there are several places containing some thousands of inhabitants. This region is inhabited by two nations—the Uzbecks and the Sartes. The former are a branch of the Turks, whose language they speak, and are the ruling nation. They have abandoned the nomadic life and live in houses, and in summer frequently to tents erected on the fields which they cultivate. Many families of these inhabitants inhabit the towns of Khvya, where their language, and occupy themselves with the cultivation of the soil, commerce, and handicraft trades. They are a very peaceable and industrious people. Among these nations a few families of Jews, Armenians, Afghans, Aimaiks, Kirghis, and Karakalpakes are settled; the last three have been import- as slaves.

The uncultivated portion of the Khatan is in possession of three nomadic tribes—the Truchmenes, Karakalpakes, and Kirghis. All three are Turkish nations, and speak dialects of the Turkish language. The Turkomenes (Truchmenes) or Turcomans, wander about in the wide region lying between Khvya Proper and the Caspian, and extending from the southern boundary of the table-land of Oost-aort to the mountains of Kasaan and of the Aimaks. They live on the great steppes, and are very peaceable and industrious. They are skilled in the arts of the camp, and live by rearing sheep and cattle. They are very firm in their faith, and build their khan. The Kirghis, who call themselves Kasaks, wander about in that immense plain which extends from the banks of the Volga to Lake Balkash. Some of their tribes living in the vicinity of the Karakalpakes appear to be in some degree dependent on the Khan of Khvya, but we do not know if that dependence is real or only nominal. They have numerous herds of horses and sheep, of which they annually im- port a great number into Khvya.

Towns and Villages.—It is observed as a very remarkable circumstance, that in no part of Central and Western Asia, except in Khvya, the country lying between two towns or large villages is interspersed with a great number of small farming establishments, which are situated in the centre of the lands belonging to them. This proves that the inhabitants must enjoy a considerable degree of security. The number of towns containing more than 1000 persons is rather great in proportion to the extent and population of the country.

Khvya, the capital and residence of the khan, consists of about 700 mud houses, but the suburbs contain 1500, and the population exceeds 12,000 individuals. The streets are crooked, and so narrow that a loaded camel cannot pass through them. The palace of the khan is only a large mud building. There are two colleges and three mosques, all built of brick. The karwanas are also of brick and arched over.

The other large towns are Nogorocht, Gurulan, Mura, and Kiptshak, in the vicinity of the Oxus, and Shawat and Taishathau in the interior of Khvya Proper. The town of Kungrad may be considered the capital of the nomadic popula- tion of the delta. In summer it has very few inhabitants, but in winter it is the common residence of several nomadic tribes that inhabit the adjacent country. Its walls are stated to be more than twelve miles in circuit.

The Manufactures of Khvya. The manufactures of Khvya are inferior to those of Bokhara, but still of some importance. The chief are those of cotton, of which several kinds of stuffs are made by the Sartes, who also work up all the raw silk made in the district. Other manufactures are the weaving of cloth and other articles of wool are made by the nomadic nations. In some places are large manufactories of earthen- ware. Several utensils of copper are made in the town of Khvya, but all the best copper imports, almost exclusively from Russia; only a few Kirghis settled in the khanate exercise the trade of blacksmiths.
Commerce. — In a country like Khryva, whose soil supplies its inhabitants abundantly with food, whilst its manufactures afford almost all the other necessaries of life, but do not yield any article for exportation, foreign commerce must be very inconsiderable. The most active is that with Bokhara, from which place also a few Indian goods are imported. We have heard of commerce with the distant and the Pacific. From time to time a caravan goes from Khryva to Orenburg. It exports a few manufactured articles, sheep-skins, hides, and horses, and brings back utensils, coffee, tea, and some woollen or silk goods. It passes through Kana Oorganeth, traverses the table-land of Oost-oort, near the shores of the Sea of Aral, and after descending to the low plain its route lies through the Little Horde of the Orenburg. The commerce between Khryva and Persia is still less important. Khryva sends there chiefly horses, and receives in return dried fruits and some silk goods.

History. — Khryva probably was a part of Bactria when that country was united to the sway of Cyrus, the founder of the Persian empire, and constituted a portion of the province of Bactria at the time of the conquests of Alexander the Great. After his death it was united to the kingdom of Syria, but separated from it by the revolt of Theodotus of Bactria (256 before Christ), who founded a separate kingdom in these parts. But in the second century before Christ the nomadic nation of the Khwarias began to ascend into Turan, to take possession of the countries north of the Oxus and south of the Sea of Aral. They seem to have laid waste the country and kept possession of it for more than two centuries. In the second century after Christ however, Bactria was reduced under the sway of the Chinese emperors, who at that period extended their dominions to the shores of the Caspian. It is not known at what time and in what way the Chinese were compelled to abandon this country. In the third century of our era it was connected with Persia, and remained so up to the tenth century, when one of its governors acquired independence and erected the kingdom of Karizim or Khowarism, which appears to have remained independent and independent state until it was conquered by Gengis Khan (1218). The descendants of Gengis Khan remained in possession of the country, which continued to form an independent kingdom under the name of Khowarism, up to 1797, when the town was taken by Tiourk, and the country annexed to his possessions. Khryva remained a part of Mawar-el-nahr, or the kingdom of Samarkand, to the beginning of the sixteenth century, when a Turkish nation, the Usbecks, under the auspices of Shibli Khan, descended from Upper Turkistan, and by degrees took possession of the whole of Turan. Khryva, as it appears, soon became an independent state under an Usbeck prince, and has remained so to this day. A few years ago it was discovered that the caravans passing between Orenburg and Bokhara, in travelling to the country east of the Sea of Aral, were frequently molested and robbed by the subjects of the Khan of Khryva, who knew that they were unable to restrain the nomadic nations from attacking the caravans, they resolved on taking possession of the country; probably also with the view of extending further their conquests in this direction; however, the government of the Emperor of China,ributed to the order of Charles, the Emperor of Russia, who was then in the neighborhood of Orenburg, and who employed none of his time on other pursuits unknown to his father. He was about fifteen when, during a public examination of the pupils of the college in Berlin where he received his instruction, he was asked: 'Why, you know nothing at all.' He replied indignantly, 'Because you cannot, or you are not taught to learn anything.' He was, therefore, sent to the university of Marburg, and afterwards to the imperial university of Khryva; he was there instructed in foreign languages, history, and the arts of war, and was appointed governor of a province in the north of Persia, where he died in 1756.
bled from place to place without finding repose for his pursuits. During the time he was in Paris, Klaproth distinguished men in the French armies, and his name became known to Napoleon. Klaproth's admiration for the French emperor must have been great, for after Napoleon had become Emperor, Klaproth, with Baron Vyse, the fallen hero in his exile. Napoleon received him very well, and it appears that Klaproth, expecting the emperor's early return to France, offered him his services, and was chosen as one of the first newspapers in France. The 'hundred days' however passed away without any notice being taken of Klaproth, and when the Bourbons returned to Paris he was at Florence, in rather uncomfortable circumstances. He was imprisoned at the Leghorn, and when the Bourbons invited him to settle in Paris, and there Klaproth live some time by his pen, when he accidentally met with William von Humboldt, who, although he had seen him only once, employed all his influence to procure for him a situation suitable to his pursuits and his merits. It was at Humboldt's recommendation that the late King of Prussia, Frederick William I., conferred upon Klaproth the honorary title of royal professor of Oriental languages and literature, which was accompanied with a liberal pension, and a promise to defray the expenses of printing whatever works the professor might think fit to publish. Klaproth was further allowed to stay in Paris as long as pleased France, and all wars and moreover enjoying an income which enabled him to gratify his love of pleasure and refined society, Klaproth now exhibited an extraordinary activity, and it was in the years succeeding his return from Paris that the most remarkable productions which established his European reputation. The life which Klaproth led in Paris, leaving his study only to plunge into the heart of the most medical and physical excitement of Paris, and the payset capital of Europe, preserved faithful to his health. In 1833 the symptoms of a drop of the chest becoming alarming, a tour to Berlin, where he was received with great distinction by the king and the public, produced a good effect; but shortly after his return to Paris the symptoms became worse, and his bodily sufferings were unfortunately accompanied by occasional derangement of his intellectual faculties. The skill of the French doctors however was more than equal to their task, and after long and painful sufferings Klaproth died suddenly, on the 27th of August, 1835, and was buried in the cemetery of Montmartre.

Klaproth was one of the best scholars and decidedly the best linguist of his age which can justly boast of great linguists. His penetration and sagacity, the quickness of his perception, were extraordinary; clearness and perspicuity distinguished his style; and his memory was so happy and capable of retaining the most difficult impressions without ever confounding them, that he seldom made more than scanty extracts. When he began a work, it was already clear and distinct in his mind, and the composition did not take him more than ten days, provided he was not interrupted by a visit to the Louvre. When we compare Klaproth with William von Humboldt, we find that Klaproth had the superiority in analytical power, while Humboldt surpassed Klaproth in the synthetic. Klaproth's books are laboriously designed, and after long and naturally of a kind disposition towards everybody. Yet this 'man was the dread both of his literary enemies and friends. The former dreaded his answers to their attacks, and the latter observed the greatest precaution in their intercourse with him, lest they should irritate his irascible temper; and it would seem as if he made no distinction between scientific and moral error, so severely did he handle those who incurred his scorn through a degree of inaccuracy or ignorance in matters of learning. His controversy with Professor Schmidt, the Mongol scholar in St. Petersburg, is an instance of this.

It would take much space to give a complete catalogue of his numerous publications, especially as the majority of them consist of pamphlets, memoirs, and dissertations, many of which are not of great importance. Previous to 1812 he had only published minor works, as for instance, 'In- schrift des Œuf, übersetzt und erklärt,' Halle, 1811, 4to., being a German translation, with notes, of a Chinese inscription: an Euphrates stone. Amschel von Hirsch's 'Asiatisches Magazin' was edited by himself. The following are his most remarkable works.

1. 'Reise in den Kaukasus,' with maps, Halle and Berlin, 1816, 12mo., being a description of the various languages and national characters; and a collection of Russian, French translation, with valuable additions, appeared in Paris in 1823: 2. 'Exécution d'Autome (The Autumnal Excursion), Peking, 30ème année Kia King, 8ème lune, jour mal-
speaksthe state of knowledge of his time. 18, Notice
d'une Mappemonde et d'une Cosmographie Chinoises, pub-
lies en Chine, l'une en 1730, l'autre en 1732, Paris, 1833,
-cr. ; 19, 'Npon o Dai itai ouan, ou Annales des Empereurs
du Japon, de M. le Dr Wv, revu et corrigé, revu et corrigé,
original par M. Klapproth, et précédé d'une Histoire My-
thologique du Japon,' Paris, 1834, 4to.
Among the publications edited or translated by Klapproth,
we mention the six volumes of the Asiatique Society of
Paris, of which he was one of the founders; Guldénstädts's
Travels in the Caucasus; Count John Potocki's Travels in
the steppes of Astrakan and the Caucasus; Father Della
Penna's description of Tibet; a description of the same coun-
try, translated from the Tibetan language into Russian, and
thence into French; Timokowski's Travels to Pekin; "Magazi-
zn Asiatique," from 1825-27, &c. &c. Among his minor pro-
ductions a letter to Baron Alexander von Humboldt on the
invention of the Compass, and another on the art of printing
and gunpowder, are both important and interesting. Klapproth's
contributions to the learned periodicals of France, Germany,
and Russia would fill more than twenty octavo volumes. Kl-
approth was not only an Oriental scholar, but also an excellent
theoretical as well as practical geographer, as appears from
Critical Observations on Arrowmith's Map of Asia; his
"Géographie d'après les Missions," published by
le l'Empereur Kiang-Loang, par les Missionnaires de Pekin,;
Paris, 1835, in four large sheets: "Carte de la Mongolie,
de la Russie, de la Corée, et du Japon," Paris, 1833;
and his monographies on the "Mekong," "Pechla," Klapproth
left ready for the press 'Description géographique,
statistique, et historique de l'Empire Chinois," which was
to appear in French and English, but has not yet been published.
The same year, he published a MS, containing a plan of an
church of Mithridates," and a Commentary on Marco Polo: both
these works were completed in his mind, but as he was not
in the habit of making many notes previous to writing, there is
not a single MS ever made ready for pub-
A complete catalogue of all his publications is con-
tained in Catalogue de la Bibliothèque de feu M. de Klapproth,
universitaires, Paris, 1835, crto. (Bibliothèque Universitaire; 
Notice du Neolog de Deutschen;
Quädrat, La France littéraire.)
KLEBER, JEAN BAPTISTE, according to the best au-
thorities, was born at Strasbourg in the year 1754, though some
place the date of his birth three or four years earlier. He
was brought up by his father, who was a domestic in the house-
hold of the Cardinal De Rohan, to the profession of a
wealth in his behalf, induced him to accompany them to
Munich, and through his influence he entered the military
career. This new situation filled him with pride and
science of war gained him the patronage of General Kaunitz,
son of the celebrated Austrian minister of that name, by
whom, at the completion of his college career, he was
appointed to a post of some importance in an Austrian
regiment. He
served seven years in that corps, which he left in 1783, in
order to return to his native country. He there resumed his
former profession, and obtained the situation of inspector of
public buildings at Béthor in Upper Alsat.

The breaking out of the French Revolution opened to him
a more brilliant career. He had taken a prominent part in a
revolt at Béthor in 1791, and had enabled the republicans of
that town, by putting himself at their head, successfully to
resist the regiment of Royal Louis, which had been called to
suppress it. To screen himself from the consequences of this
act of rebellion, he joined a private soldier in the
corps of the battalion of volunteers which had been raised in
the department of the Upper Rhine. By his bravery and
talents he soon attained the rank of adjutant-major, in which
capacity he was soon taken notice of. When
Custine was afterwards brought to trial, he had the
courage to present himself before his sanguinary judges, and
give testimony in his favour. At the siege of Mayence in 1792, considered one of the

services were rewarded by the rank of adjutant-general, and
shortly afterwards he became brigadier-general. From thence
he was ordered to La Vendée to oppose the insurgent royal-
ists, who, conducted by M. de Bassette, King of the Rooks of
the Vendéens, and assisted by a community of the clergy of
Mount Cenis, whose courage and devotion he could reckon. At the cele-
brate combat of Toulou (September 19, 1793), while charging
the army at the head of the advanced guard of his regiment,
he fell with several wounds, and his life was only preserved
by the prompt assistance of his soldiers. The agents of the
National Convention construed into a crime his humane inter-
ference in stopping the cruelties which were exercised towards
the prisoners. After the termination of this affair, he was cres-
ated. However he was only removed to a command in the Army
of the North, and afterwards in that of the Sambre and Meuse,
where he held a general of a rank of division.

At the battle of Fleurus (June 26, 1794) he commanded
the left wing of the French army, and by his skilful ma-
noeuvres greatly contributed to the victory. He then marched
against Mons, which he took from the Austrians, and having
forced the passage of the Scarpe, he advanced again to the
right bank of the Rhine. Returning towards Maasstricht,
he took that strong fortress, after a siege of twenty-eight days.
In 1795 he directed the passage across the Rhine of
the army of the Sambre and Meuse, and, when compelled to
retire before superior forces, he effected a retreat in which
his cool intrepidity and skilful dispositions were alike remark-
able. In the year following he put to the glory which
attended the success of General Jourdan's operations at the
opening of the campaign; and he afterwards refused the com-
mand of Pichegru's army, when this general was disgraced
by holding his troops to inaction.

(From "Lexique historique de l'Europe moderne," by Paul de Puy.
C. J.)

Discontented with the manner in which the Directory
managed the military affairs, Kléber retired to Paris, where he
spent the greater part of the year 1797, and occupied him-
self with the military affairs. His wish to command
was not satisfied, as he was appointed to the chief command of the army for Egypt;
he made it a special request to the Directory to be allowed
to take him as one of his generals of division. Kléber joyfully
accepted the appointment, and the plan of an army for Egypt,
brilliant achievements already prognosticated his future glory.
The army likewise which he accompanied was in a great measure composed of the veteran soldiers, who had distin-
guished themselves in the war of 1793-94. After so many

At the siege of Alexandria, on the first landing of
the French forces, he was wounded in the head while gallantly
climbing the ramparts, but he did not retire from the conflict
but he was carried to hospital a second and a severe wound. While in
hospital he was taken Kléber was appointed to the command of it,
and of the whole province of which it was the head-quarters. He
afterwards joined his division and took part in the expedi-
tion to Syria; there he distinguished himself by the cap-
cature of the fort of El Arish and Gaza, and was at the taking
of Jaffa. He was also at the memorable siege of St. John of
Acre, where he rendered himself conspicuous by his un-
daunted bravery, and shared every danger with the common
soldiers. He was however withdrawn from the siege by order of
Bonaparte, who desired him to march with his division to
reinforce the troops stationed at Nazareth under the command
of General Mathews, and to repel the attack of the
remnants of the Mamelukes under Ibrahim Bey, the
Janissaries of Aleppo and Damascus, and numerous hordes of
irregular cavalry, who were advancing upon their rear, and
were bid to storm the walls of Acre. The arrival of Kléber's divi-
sion was most opportune, for the enemy had already crossed
the Jordan, and were rapidly pressing in considerable numbers
towards the coast. Kléber left Nazareth with the entire
distraction of his troops in order to make an attack upon the
Turkish camp, but in attempting to do so he was anticipated by
the enemy, who advanced against him with fifteen thousand cavalry
and as many infantry. Kléber formed his small army of two
thousand men in squares, and placed the artillery at the
angles, which had scarcely been effected when he was
fiercely attacked by the whole force of the enemy's horse.
A deadly fire from the close range which the
remnants of the Mamelukes and
the Janissaries poured in upon the
Turkish troops. The siege of Acre however was renewed
in vain, every assault against it proved unsuccessful, and
British valor, combined with Asiatic enthusiasm, was finally
triumphantly repelled. (From "Lexique historique de l'Europe
modernes" by Puy.
C. J.)

The French on their return to Egypt obtained at Aboukir
another signal victory over the Turks; and the day after this
decisive battle Bonaparte returned to Alexandria, where he
was greeted by the cheering crowds; and Count de Cuyerea, the
close blockade of Malta by the same powers. These
circumstances, combined with the loss of his fleet at the
battle of the Nile, determined him upon leaving Egypt.
On the 22nd of August, 1799, he secretly embarked, accompanied by several of his generals, his secretary Bourrienne, with Berthollet and Monge, who had joined the expedition for the furtherance of science. Before leaving he signed his orders for Kléber by adding his name. He had appointed him his successor in the chief command of the Egyptian army, and authorized him to conclude a convention for the evacuation of the country in the event of no succour arriving. At the same time he wrote to Napoléon of the great mortality from the plague amongst his soldiers should amount to fifteen hundred men.

The sudden departure of Bonaparte spread anxiety and distress in the camp; the reputation of his successor however, who enjoyed the highest confidence of the army, tended greatly to dissipate their fears. But the talents of Kléber did not at first appear to be equal to the difficult circumstances in which he was placed. He not only permitted himself to be swayed by feelings of indignation at what he deemed the abandonment of the army by his former chief, but he committed the fault, which in his position became a crime, of openly declaring his opinions to his disconsolate colleagues in command; he thus caused the seeds of discontent and desire of home, which had been previously sown among the troops, to ripen to a maturity which soon threatened the ruin of the expedition. A letter addressed by him to the Directory contains many erroneous and exaggerated statements which had been furnished by Pousseeilgue the army administrator, relative to his own and public affairs in Egypt. A copy of it is in the Memoirs dictated by Napoléon at St. Helena to the Count de Montholon, and is rendered more valuable on account of the copious comments which are prefixed thereto, that is, the analyses of the French spirit, are for the most part borne out by contemporary testimony.

In this letter Kléber complains that his army is reduced to one-half; that it is destitute of the necessary stores and munitions, and that the greatest discontent prevails. He further states that the Manœuvres were dispersed but not destroyed, and that the Grand Vizir was marching from Acre to the head of thirty thousand men. Two copies of this letter were sent, one of which fell into the hands of the English who was the immediate cause of the expedition under Sir Ralph Abercromby, by which the French were compelled to abandon Egypt. In justice however to Kléber it must be mentioned that his chief fault consisted in trusting too implicitly to the statements which had been given to him by one who, though loaded with favours from Bonaparte, made this ungrateful return to his absent benefactor in order to secure his present interests.

Kléber, under the influence of these despondent feelings, addressed proposals of accommodation to the Grand Vizir; though at the same time he made vigorous preparations to repulse an attack. This proceeded the necessity of a negotiation. The Grand Vizir with upwards of forty thousand men had crossed the desert, and, assisted by some British officers, had captured the fort of El Arish on the 29th of January, 1800. The English Government at Desmaiz was, against his will and contrary to his judgment, appointed negotiator on the part of the French, and, after many debates and frequent delays, a convention was signed at El Arish on the 29th of January, 1800, by which it was agreed that the whole of Kléber's army should return to Europe, with its arms and baggage, either on board their own vessels or some furnished by the Turks; that all the fortresses of Egypt, with the exception of Alexandria, Rosetta, and Aboukir, should be surrendered within forty-five days from the time that the convention was ratified; and finally, that the Vizir should pay a sum equivalent to about 30,000,000 francs, during the evacuation was taking place. The English admiral, Sir Sidney Smith, though not vested with full authority from his government to conclude such a convention, had entered willingly into it, as it was hoped would precluding see it carried into effect. Three months however before those events the British government had dispatched orders to Lord Keith, who had the command of the Mediterranean arm of the allied convention. It was not stipulated that the French army should be considered prisoners of war; and a letter from this admiral reached General Kléber, warning him of his intention to detain any vessel returning to Europe. The Convention was signed under the name of the French commander made a noble use of the opportunity which was now presented to him of retrieving his military character. Danger reviver his energies and roused his courage. He immediately ordered the evacuation of the stronghold to be stopped, and prepared to resume hostilities. In one of those acting proclamations so common in modern French warfare, he indignantly declared to his soldiers that victory was the only answer to such insolence, and bade them be ready to fight. This appeal to their courage was entirely with the shouts of the army. On the night of the 10th of March, 1800, Kléber formed his army, which was 12,000 strong, into four squares, with the artillery at the angles, and the cavalry in the rear. The main body was formed and commanded by General Regnier, and those on the right by General Friant; the whole army was drawn up on the plain fronting the ruins of Heliopolis. Before them were the Ottoman army, advancing towards it in their rear was Cairo with its three hundred thousand inhabitants, waiting only the signal of success to join the standard of their faith. The formation of the French had taken place by moonlight; perfect order and deep silence prevailed throughout the ranks, and every soldier felt that the fate of Kléber and of Egypt hung on the issue of the contest. A large body of Turkish troops had encamped in the villages of Matarieh, and a movement was made by the division of Regnier to cut it off before the remainder of the army could come up to its support. No sooner did the Janizaries perceive the approach of the hostile columns than, rallying forth from their entrenchments, they attacked them with desperate courage. Steadily onwards however moved the unbroken bands, pouring forth a rolling fire. They drove the enemy back to their camp, while their cavalry charged the squares of the Turkish cavalry soon enveloped the compact squares by whose murderous fire they fell so rapidly that a barrier of bodies was formed around them, and impeded the renewed attacks of the impetuous horsemen. But Astile value could not long withstand European discipline, and the Turks at last fell in confusion towards the desert. Kléber, following up his success, hastened to El Karah, where was posted the enemy's army, were according themselves closely pressed, hastily retired, leaving behind them the whole of their baggage and munitions. Thus ended the battle of Heliopolis, important in its results, and attended by little loss to the French, who numbered only two or three hundred killed and wounded. The relief of Cairo, in whose citadel two thousand men under General Verdiere were closely besieged, was the next object. The firing had scarcely ceased in the plains of Heliopolis when the sound of cannon was heard from Cairo; it informed Kléber that fresh exactions were required, and he instantly proceeded to the rescue of his countrymen. The Turks under Ibrahim Bey, who formed the besieging army, were hanging on the verge of a serious battle, to evacuate the town; but the excited populace of Cairo refused to listen to any terms, and prepared themselves for a desperate resistance. It became necessary to take by storm Boulah, and the energies of the French, which had returned from the pursuit of the Grand Vizir, invested the city. On a further refusal to surrender, a severe cannonade was directed against it, and it was finally entered by assault. A desperate struggle ensued between the besieged, who occupied the houses, and the besiegers, who pressed on in the streets. Night alone terminated the contest; and, on the following morning the Turks offered to capitulate, and were permitted to do so on favourable terms. Kléber, in this instance, as in many others, enhanced his victory by his moderation and humanity.

About the time that these events were taking place, another body of the Turkish army had laid down their arms to General Belliard; and Mourad Bey, the chief of the Manœuvres, deputed of every hope of ultimate success, concluded an honourable convention with the English that the Turks had returned within a month of the battle of Heliopolis, the French were again in possession of their previous conquests. With an army trudging in numbers, with a numerous enemy in his front, more than half completed by death, and his courage were so greatly renowned, with all Egypt revolted in his rear, and when the English considered that he would be compelled to surrender on any conditions, in less than forty days he had overridden the Ottoman emperors, and completely dispersed the revolted Egyptians. A graphic description of the Turkish mode of warfare is to be found in the eighth volume of Alison's 'History of Europe,' to which valuable work we have been much indebted for the details of this narrative.
Released from immediate danger, Kléber now began to direct his energies to more pacific labors, and to apply them to the administration of the conquered country. His plan appears to have been that of first asserting the position of the victorious army, and to adopt the course followed by the British government in India of enlisting in its service the native troops. Scarcely however had he entered on this work when he was involved in an expedition to Egypt. A young Turk, a native of Aleppo, named Suleiman, was incited to the atrocious act by religious fanaticism and the prospect of an ample reward. He had performed the pilgrimage of Mecca and Mezireh, and his mind was deeply impressed with the tenets of the Musalmans' faith. He cherished the idea of being in Palestine, when the remaining remnant of the vizier's army was passing through that country, and he became acquainted with Kléber, who was then at Jericho, at whose suggestion he was sent to become the instrument of what he considered divine vengeance on 'the sultan of the French.' He was furnished with a sum of money, with which he proceeded to Cairo, and spent several weeks in seclusion in a mosque of that city. He had intimated his purpose to the four principal sheikhs of the mosque, who, though they attempted to dissuade him from it, took no steps to prevent its execution. He armed himself with a poniard, and having followed Kléber several days without being able to effect his purpose, he at length determined upon concealing himself in an abandoned cistern in the garden attached to the mansion which the general occupied. On the evening of the 29th of June, 1798, Kléber was passing with Protais, the architect of the army, and he was pointing out to him some repairs which the building required, when Suleiman presented himself before him as a supplicant for alms; who, referring to his function, was seized with the opportunity of rapidly striking him several times with his dagger. The architect, who was armed with a stick, attempting to interfere, received a severe though not deadly wound. The guards having hastened at the cry of Kléber, secured the assassin, whom they found concealed behind some ruins. Universal sorrow spread through the army, and the Arabs themselves, who had frequently admired and experienced his clement disposition, regretted his fall. A military commission was immediately assembled to try the assassin, boldly confessed, and even gloated in his crime. The four sheikhs, the partake of his confidence, were beheaded, and Suleiman was impaled alive.

Thus prematurely perished this distinguished general, and with him the hopes of the eastern expedition. He had formed many important designs for colonizing the country, and it is probable that, under his judicious rule, it might long have been preserved a valuable acquisition to the French Republic. 'There is no military man,' says Napoleon, 'who will deny that the army of Acrebrouck would have been detested if Kléber had lived. How many times was the weight of a young fanatic, acting on the faith of a doubtful passage of the Koran, in the general balance of the world?' Though many may hesitate to agree with this assertion, it is certain that the name of Kléber was strongly contrasted with that of his successor General Menou, to whom by seniority devolved the chief command of the expedition. In a conversation with Dr. O'Meara, Napoleon further remarks that, of all his generals, Desaix and Kléber possessed the greatest talents. There was also a melancholy coincidence in their deaths: on the same day, and nearly at the same hour, that Kléber fell under the stroke of an assassin in Egypt, Desaix, who had left that country about three months previously, found a glorious death on the plains of Marengo.

Kléber,' says a celebrated French writer, 'was the finest man in this revolution. His lofty stature, his noble countenance, whose features were animated by the fire of his soul, his valour at once bold and calm, his prompt and sure intelligence, rendered him on the field of battle the most commanding of commanders. His talents, though unaided by education, were brilliant and original. The works of Plutarch and Quintus Curtius were his constant and exclusive study; he sought in them that nurture of lofty minds which the active and warlike soldiers of the Republic had been deprived of. All the glories of his conduct were capricious, indolent, and capricious. It has been said of him, with truth, that he was as unwilling to command as to obey. He obeyed indeed under General Bonaparte, but it was as an obedient man, he could not bear another's name, as in the campaign with General Jourdan; it was in the midst of combat that, by a species of inspiration, he assumed the command, and exercised it with mastery...
Newton’s experiment on which it was founded, were impugned by Klingenstaerna, who, from his own experiments, found that although most grains had a golden-yellow color, under the circumstances in which Newton supposed it would be wholly free from it. In 1744 he transmitted to the Royal Society an account of his experiments, together with some investigations on the dispersion of light in lenses, and these papers induced that distinguished artist to have again recourse to experiments with a view of determining more accurately the nature of the refractive power of lenses. It was in the prosecution of these experiments that Dollond discovered that combination of lenses of flint and crown glass by which the dispersions of light have been so nearly corrected in optical instruments. He was a fellow of the Royal Society of London in 1730; and in the ‘Philosophical Transactions’ for 1731 there is a paper by him on the quadrature of hyperbolic curves.

Klingenstaerna died Oct. 28, 1785; and by order of the crown, the mother of his pupil Gustavus III., he was buried in the tomb of Dalin, who had died a short time before him.

KNAPPA, a genus of plants belonging to the natural order Gramineae. It has an influence, with a somewhat one-sided raceme. The flowers solitary; glumes not keeled, and blunt. It has 2 pale, when dry, very sly; one obtuse, unequal, and without awns. There is but one species of Knapia.

K. amplexicaulis, an elegant but very small grass, with a small tuft, containing, having numerous stems and short polygon leaves. The spikes are slender, consisting of from 5 to 10 mostly sessile alternate spicules. It is found in sandy maritime pastures, but is rare in grass.

Knauth (author님의 독감, a German botanist), a genus of plants belonging to the natural order Dips-aescaceae. The inner calyx is cup-shaped, with radiant teeth, the outer one forming a thickened margin: the germs. It has 4-fld corymb, a fruit with 4 sides and 8 little depressions, the receptacle with spinous scales shorter than the involucre.

K. arenaria, the Field Scabious, has its lower leaves simple, the stem-leaves pinnatid, the inner calyx with 8 or 16 somewhat awned teeth. The stem rises from 2 to 3 feet in height, it is 1 or 2, the flowers few, the petals are purple, in large, convoluted long-stalked heads. This is the only British species of this genus. There are a few species of Knautia natives of Europe.

Knibb, Rev. William. Of the early life of this devoted missionary few particulars have yet been made public, but the very brief interval which has elapsed between his unexpected death and the time of writing this article (January, 1846) is sufficient to account for the lack of such biographical information. From a sketch of his life and character in the ‘Patriot’ newspaper of December 22, 1844, to which we are mainly indebted for the materials of this notice, it would appear that he was born at Kettering in Northamptonshire (a place, it may be remarked, early connected with the history of the Baptist Church, P. C. p. 270), about the commencement of the present century. In due time he was apprenticed to a printer at Bristol, where he appears to have made an early profession of religion. His early inclinations were gratified by his admission into the Baptist Church in 1823, when he undertook the charge of a school connected with one of the Baptist Mission churches in Jamaica, where he died, in May, 1824. The intelligence of his death so excited the zeal of Mr. Knibb, the late London Missionary Society agent for the island, that he at once visited the scene of his death. He was present at the inquest, and, as one who was well acquainted with him, he was enabled to furnish much that was valuable.

In the autumn of 1834 Mr. Knibb returned to Jamaica, and in the following summer he was invited to undertake the charge of a school connected with one of the Baptist Mission churches in Jamaica, where he died, in May, 1824. The intelligence of his death so excited the zeal of Mr. Knibb, the late London Missionary Society agent for the island, that he at once visited the scene of his death. He was present at the inquest, and, as one who was well acquainted with him, he was enabled to furnish much that was valuable.

1835. The death of Mr. Knibb, another missionary of the same denomination, he accepted a prearranged invitation to succeed him as pastor of the mission church at Falmouth. He then removed to the island of St. John, of between eight and nine hundred members. Shortly after Mr. Knibb’s settlement at Falmouth he was brought into painful notoriety in consequence of the breaking out of an alarming spirit of abolitionism, which had been communicated to him by various letters, and by the influence of that spirit, which had been embodied in an anti-slavery petition, had been actually sent to the West Indies, but had been suppressed or held back through the influence of the slave-owners; and, in consequence of this belief, the slaves upon several estates in Jamaica avowed, towards the latter end of December, 1831, their determination to do no work after Christmas. So soon as the missionaries became acquainted with this state of things, they endeavoured to remove the erroneous impression from the minds of such of the negroes as were under their influence, and were so active in their measures as to lead to a report among the disaffected slaves that the white people had bribed Mr. Blyth (a Presbyterian missionary) and Mr. Knibb to withhold their freedom. In surreptitious movements were, in spite of all the efforts of the missionaries, actually commenced by the negroes, although the interposition of Mr. Knibb, who possessed great influence over the slaves, saved them for several of his mission and dispersed them to their respective plantations. Notwithstanding this fact both he and his brother missionaries were regarded with great jealousy by the planters, overseers, and others in the slave-holding interest, whose enmity had been excited by their efforts for delaying the conclusion of the negroes, and by the part they had taken in exposing many cases of gross cruelty and oppression. On the 1st of January, 1832, Mr. Knibb was compelled, without regard to his sacred mission, to leave the island, and while on shore he was arrested and with marked indignity. Having a few days later, memorialized the governor for exemption from military service, he was arrested, and debarred from any communication with his family, upon the plea of alarming intelligence by which it was pretended, the missionaries were implicated in the rebellion. After suffering much persecution, he was released in February, no evidence being obtained to support a criminal prosecution; but in March fresh steps were taken to bring him to trial, though on the day appointed for trial the proceedings were abandoned upon the appearance of about three hundred witnesses who came forward, upon a few hours' notice, in his defence.

During the continuance of disturbances in the island Mr. Knibb’s chapel and mission premises at Falmouth were razed to the ground by the negroes, under the direction of a certain regiment, who had used them as barracks for a time; and as similar outrages had been committed on other missionary stations, it was determined that Mr. Knibb, accompanied by Mr. Burchell, should visit the English Colony and present the grievances and demands of the mission. They accordingly reached England in the beginning of June. Down to that time the Baptist Missionary Society had carefully avoided taking any part in the question of emancipation, regarding it as one of the political questions on which it was desirable to observe a rigid neutrality. Mr. Knibb was accordingly cautioned not to commit the Society by his proceedings; but, warmed with enthusiasm to the highest pitch by his personal knowledge of the horrors of the system, he boldly declared that the Society’s missionary stations in Jamaica could no longer exist without the entire and immediate abolition of slavery, and, feeling that the time had now arrived for making that declaration at the annual meeting of the Society on the 31st of June, to avow this at the risk of his connexion with the Society. Mr. Knibb carried the meeting, and subsequently the feeling of the meeting was so strong in favor of the agitation on this subject, that his stirring appeals had no unimportant share in bringing about the Emancipation Act of 1833.

In the autumn of 1834 Mr. Knibb returned to Jamaica, and in the following summer he was again invited to undertake the charge of a school connected with one of the Baptist Mission churches at Falmouth, and of a new Lancaster school for children of all denominations at Trelawney, was commenced under his superintendence. The same benevolence and energy which had led Mr. Knibb to the western district, induced him now to expose the failure of the apprenticeship system established by the act of 1833, as
KNOX

KNOX

a means of preventing the evils anticipated from sudden emancipation. He showed that many of the worst features of slavery were continued under the guise of apprenticeship, and indirectly to anticipate to some extent a law by immediate emancipation. After the complete emancipation of the slaves or apprentices, on the 1st of August, 1838, Mr. Knibb purchased, by the aid of English friends, a tract of ground for the purpose of founding an independent and occupa-
tion for the liberated negroes; and he erected a normal school at the village of Kettering, in Trelawny, for training native and other schoolmistresses for both Jamaica and Africa. As a consequence of the missionary work of the Church of England in Jamaica, and the mission churches in Jamaica, it was determined by the missionaries to separate themselves from the Baptist Missionary Society, so far as any dependence upon them was concerned. Church was constituted in the same year Mr. Knibb visited England to promote the establish-
ment of a theological seminary in connexion with the native mission to Africa, which had been commenced about two years before, through his exertions. In the early part of 1845 he again visited England, to obtain pecuniary aid for the negroes connected with the Baptist churches in Jamaica, who, in a new way, made the victims of cruel oppres-
sion, in consequence of the adoption, by the colonial legis-
lature, of a system of taxation which bore upon the liberated negro labourers with extreme severity, by limiting the supply of food and other necessaries, and at the same time importing, by the revenue from the sale of emancipated negroes, a large number of European and foreign labourers, so as to overstock the labour-market, and reduce the persecuted negroes to the greatest distress. Hav-
ing succeeded in obtaining both sympathy and pecuniary assistance for his objects, he returned to Jamaica. In the fall of the same year he was seized with yellow fever, and died, after an illness of only four days, on the 16th of that month, at the village of Kettering. Though his funeral took place on the following day, much was not respected by the friends of the memory that not less than eight thousand persons are said to have assembled on the occasion.

It is yet, perhaps, too soon to form, between the enthusiastic passport of his friends and admirers, and the bitter vituperations of his political opponents, and of the men whose opposition he expressed with such unflinching courage, an accurate estimate of the character of William Knibb. Of a peculiarly ardent temperament, and feeling that he had under-
taken the championship of a cause which demanded all the zeal and energy which could be called into exercise for the exposure of enormous wrongs, he sometimes exceeded, in the estimation of his best friends, the bounds of prudence, if not of charity; but it should never be forgotten that his long resi-
dence in Jamaica, and his intimate knowledge of the state of the country, enabled him to furnish an intimate but real, if not to be realized by his friends in this country, the cruelties which he laboured to abolish or to mitigate. As an instru-
ment in the mental and moral elevation of the negro character, the negro will long be honored in the African race. A full account of the important transac-
tions in which he was involved is given in the second volume of Dr. Cox's 'History of the Baptist Missionary Society.'

KNOLE, MARTIN VON, a distinguished German painter of the eighteenth century, was born in the village of Steinhach in the Tyrol, in 1725. His father appears to have been a poor painter of some sort, and he intended his son to follow his own pursuit. He was however in such circum-
stances as to make it necessary for his son to perform the menial work of the house, which Martin appears to have found particularly distasteful. The boy accordingly ran away from home, and took shelter in the house of a rath von Harnay, at Innsbruck, who, when he had heard the boy's story, let his father know of his safety, and placed him with an ordinary painter of the name of Pögel, who thus became Martin's master, and who have had the slightest influence upon him, if any at all. Martin's father however required his son's services in every way, and he was forced to return home, where he divided his time be-
tween the requirements of his art, in which he was very skilful, and other way he could, and in the performance of menial domestic offices. Such was the state of affairs when circumstances brought the painter Paul Troger, on his return to Viechtach, where Martin, with some of the extraordinary productions of Knoller, then twenty years of age, Troger perceived the lad's ability, and offered to take him with him to Vienna. Young Knoller went with his patron, and in eight years from that time he had not a superior of his own age in the Austrian dominions. Already, in the years 1748-50, he assisted Troger in the frescoes of the cathedral church of Britzen; and in 1750 he obtained the important position of pupil for the church of St. Stephen, in Vienna. In 1753 Knoller returned to the Tyrol, and in the following year painted in fresco the church of Annas in such much in the manner of Troger that it might pass for the work of that master. In 1754 he was engaged in the restoration of the design and sharp in his outline. In 1756 Knoller visited Rome, and greatly improved his style during the three years he spent in that city. From Rome he was invited to Naples, and was engaged in painting the Church of the Illustrious, where he employed him much in that city, and in the decoration of his palace at Milan. Knoller visited Rome several times subse-
sequently, and contracted a close friendship with Winckelmann, and with his death he was considerably impoverished. In 1760 he left Italy, and returned to Vienna, where he continued to paint in frescoes, the frescoes of the church of Volders near Hall, in the Tyrol, consisting of passages from the life of San Carlo Borromeo. In 1765 he returned to Milan to his former patron, Count Firmian, whose esteem and patronage induced Knoller to make Milan his head-quarters, and he there mar-
ried, in 1767, the daughter of a merchant, by whom he had nine children. Knoller painted many works in Milan, in oil and in fresco, the best of which is a ceiling in the palace of the Prince Belgioioso, representing the apotheosis of one of his ancestors. The palace of the Count Firmian was rich in Knoller's works. His principal German works are the fres-
coes of the church of Our Lady in Wilten, near Innsbruck, and the seven cupolas of the church of Neresheim in Wur-
temberg, painted in 1770-75, for which he received 23,000 florins. He painted a large fresco, 110 feet by 33, in the chapel of Maria-Turin, near Turin, for which he received 2,000 Vir-
gin; and there are altar-pieces by him in several churches in the south of Bavaria. He was much engaged also at Vienna, but chiefly in portrait painting; be was there ennobled, with the title of normannia, and there are many of his works in the Tyrol, at Innsbruck, Bozen, and other places. The church of his native place, Steinhach, possesses three altar-pieces by Knoller. He died in 1804. He was gay in colouring, accurate and vigorous in design, and his works are chiefly characterised for their physical qualities—dramatic and effective composition, strong expression, and vigorous and uncommon attitude. His sphere was almost exclusively the practical part of art; the true historical and aesthetical he hardly approached; but this might be said of many more emi-
nent painters. A Life of Knoller was published in the ' Bei-
träge zur Geschichte und Statistik der Tyrol,' for 1881.

(Lipowsky, Künstler-Lexicon; Fitoilo, Geschichte, &c.; Nagler, Künstler-Lexicon.)

K. NOULTONIA, a genus of plants belonging to the nat-
ural order Leguminosae, family of Caesalpinieae. The
petals, with the margins nacked. The stamens and ovaries numerous; many 1-seeded succulent fruits, not pointed by the style, which is deciduous. The species are 1-seeded peren-
niel herbs, the flowers are pointed, with the fruit 3-angled and flat-
dowered. The leaves are used as vestiaca in the Cape of Good Hope. There are four other species, native of the Cape of Good Hope, where these plants grow in abun-
dance. They will thrive well in a mixture of loam and peat,
and may be increased either by dividing the root or by seed.

(Dow, Gardener's Dictionary; Lindley, Flora Medicinali.

KNOX, REV. VICEMISUS, D.D., was born at New
instant of the Rev. Mr. Knoller, LL.B., Fellow of St. John's College, Oxford, and head master of Merchant Taylors' School, Lon-
non. Vicemisus Knox, the son, was also educated at St. John's; and was made head master of the school at the time of his settling at Tunbridge, and his wife died in 1809, leaving two sons and a daughter. A short time after his marriage he received the degree of D.D. by diploma from the University of Cambridge. He was the second head master of Tunbridge School thirty-three years, he retired, and was succeeded by his eldest son. He was rector of Rumwell and Ramsden Crays, in Essex, and minister of the chapelry of Shipbourne, in Kent. He performed the duties of a parish
priest nearly forty years with great regularity. In the latter part of his life he resided in London. He was much admired as a preacher, and frequently gave his aid in behalf of public charities by delivering a sermon. He died while on a visit to his son in Cambridge, Sept. 6, 1871.

Dr. Knox's chief works were—1, 'Essays, Moral and Literary,' 12mo., 1777, which came out anonymously, and met with so much success that he republished them in 1778, with additions. 2, 'Liberal Education, or a Practical Treatise on the Methods of acquiring Useful and Polite Learning,' 8vo., 1781, enlarged in 1785 to 2 vols. 8vo. This work was chiefly intended as a recommendation of the principles of the English universities, and is said to have had some effect in producing a reformation 3, 'Elegant Extracts in Prose,' 8vo. 4, 'Winter Evenings, or Laccubrations on Life and Letters,' 3 vols. 12mo., 1784. 5, 'Elegant Extracts in Verse,' 1790, 8vo. 6, 'Sermons intended to promote Faith, Hope, and Charity,' 1792, 8vo. 7, 'Elegant Epistles,' 8vo., 1792. 8, 'Family Lectures,' 8vo., 1794. 9, 'Christian Philosophy, or an Attempt to display the Evidence and Excellence of Revealed Religion,' 2 vols. 12mo., 1795. 10, 'Considerations on the Nature and Efficacy of the Lord's Supper,' 12mo., 1799.

Dr. Knox published a few other minor works, occasional sermons, and poems.

Dr. Knox's writings were once much admired. His style has considerable neatness and elegance, but he has little originality or power of thought, and his popularity has for some years been on the decline. The 'Elegant Extracts' were made with much taste and judgement. They were very useful works in their day, and had for many years a large circulation.

(Dr. Knox's 'Poems and Obituary, 1822; Watt's 'Bibliotheca Britannica.')

KOEBELL, the name of several German and Dutch landscape painters, of whom the following are the most distinguished.

Ferdinand Koebel was born at Mannheim in 1740, and was educated by his father with a view to obtaining an honourable position in the civil service of the Electoral government. He had long meditated on becoming a lawyer or a diplomat, or even a lawyer or a diplomat, or even a archaeologist, or a landscape painter. Ferdinand however had an invincible passion for landscape-painting, which the encouragement of the emperor Prince Karl Theodor, enabled him finally to follow, notwithstanding the opposition of his father. He studied eighteen months at Paris, in 1768-70, at the expense of the elector, who appointed him his cabinet painter after his return to Mannheim; he was also made a member of and secretary to the Academy of Mannheim. In 1793 he removed to Munich, where he died in 1796. Koebel was also a very able etcher: a set of his prints, 'The Battle of the Carnival at Mannheim,' from drawings by Count Seckendorf, is a beautiful example of Koebel's style. His etchings have been published by the Kunstblatt, and are among the most important of his productions. In his Dictionary. Koebel's landscapes are well selected, true in colouring, and executed with care: the figures in them are painted by himself.

Ferdinand Koebel, the younger brother of Ferdinand, was born at Mannheim in 1748. He was intended for a merchant, and spent four years in a merchant's house at Mainz; but his love for the arts, especially landscape and architecture, finally overruled all obstacles, and his brother's patron, the great collector, Theodor, befriended him also, and enabled him, in 1776, to visit Italy, where he remained an enthusiastic student of Italian painting, chiefly at Rome, for nine years. From Rome he passed to Florence, and then to feel the invigorating influence of the landscapes of Academia and Seckendorf, and then to learn from the landscapes of Theodor and Seckendorf, and then to become a landscape painter, and then to be appointed a member of the Academy. Koebel's landscapes are well selected, true in colouring, and executed with care: the figures in them are painted by himself.

KOELE, a genus of plants belonging to the natural order Gramineae. It has unequal glumes, the upper one with 2 or 3 ribs, shorter than the compressed. The outer pales is narrow, rough at the edges, and ciliate. In dry places the leaves are much shorter than the stem; in damp places elongated, as long as the leaves. (Babington, 'Manual of British Botany.')

KOELE/RIA, a genus of plants belonging to the natural order Gramineae. It has unequal glumes, the upper one with 2 or 3 ribs, shorter than the compressed. The outer pales is narrow, rough at the edges, and ciliate. In dry places the leaves are much shorter than the stem; in damp places elongated, as long as the leaves. (Babington, 'Manual of British Botany.')

KONIGA, a genus of plants belonging to the natural order Cruciferae. It has an oval compressed poutch, from 1 to 2 seeds in each cell, simple filaments, and 8 hypogynous glands. But one British species of this genus has been described, K. maritima, which is a procumbent plant, with bipartite hairs, lanceolate acute leaves, oval pointed glabrous pods. It is the Lobularia of Koch, and the Gyco of Lindley. The flowers are white and scent-scented.

KOTTBUS, [COTTBUS, P.C.] KRAFFT, an old sculptor and architect of Nürnberg, where he was born about 1430; he married in 1470. There are several of his performances still extant in the city and churches of Nürnberg, but the principal is the huge figure of St. Lawrence, which is one of the columns of the church of St. Lawrence, Lorenskirche. It is in the form of a square open Shakespearean spire, and is 64 feet high, the pinnacle being turned downwards, like the points of a crenel; and the whole design is the work of the church. The ciborium is placed immediately upon a low platform which is supported partly by the columns of Adam Kraft and his assistants, and partly by a wall, or 12 feet of the platform itself is hollowed, and ornamented with the figures of eight saints. The whole tabernacle is also profusely ornamented with small figures in the round and basque-reliefs: immediately above the ciborium, on three sides, are representa-

K U R

tations in boso relicue of Christ taking leave of his Mother, the Last Supper, and Christ on the Mount of Olives; high above them is Christ before Caiphas, the Crowning with Thorns and the Scourging; above those are the Crucifixion and, lastly, above that is the Resurrection, all in the round. This elaborate work was executed by Kraft for a citizen of the town of Han, executed on a raft, but so strenuous was the task that both of are still involved in their former uncertainty. He is supposed to have died in the Hospital of Schwabach in 1507. Sandrart has inserted the portrait of Kraft in his 'Academy,' from a work referred to above, unless he had been in a tabernacle. (Sandrart, 'Deutsche Academie,' &c.; Doppelmayr, 'Historische Nachricht von den Nurnbergerischen Künstlern,' &c.; Fuseli, 'Allgemeines Künstler-Lexicon,' Nagler, 'Allgemeines Künstler-Lexicon.')

KÜGELGEN, GERHARD and CARL VON, twin brothers and distinguished painters, were born at Bacharach on the Rhine, in 1772. Their father was Hof-Kammerrat, exchequer-counselor, in the service of the elector of Cologne, who in 1721 sent the twins to complete their studies in Rome after they had made sufficient progress at home. Gerhard painted history and portrait; and Carl, landscape. Gerhard was induced to try his fortune at St. Petersburg, whither he was sent by his brother, who was already resident there, and broke through both with great success, and married two sisters, of a noble family of Curland; but Gerhard, after a few years, removed in 1804 to Dresden; Carl remained at St. Petersburg, where he was appointed professor of painting and architecture, and where he had established himself, and a high reputation, at Dresden, where he held the appointment of professor of painting at the Academy, where his career was suddenly cut off in a most melancholy manner. He was brutally murdered and murdered on the road from Pillnitz to Dresden, not far from the capital, in 1820. It was a common highway robbery; the miserable wretch who committed the deed was not in the least aware of who his victim was. He was a painter of singular dignity, and the cause of his detection. He even drew off the boots of Kugelgen, and his afterwards taking these boots to be mended to the very man who had made them and who knew them, is said to have been the cause of his detection. Kugelgen's works are of a very undignifying character; in most of them an abstract religious sentiment is the chief and characteristic motive; in execution they are careful, delicate, and somewhat formal, yet pleasing and impressive. He delighted in compositions of one or at most very few figures; often three-quarter lengths of the size of life. His biography, by E. F. Griesbach, was published in Leipzig in 1845.

Carl Kugelgen painted many landscapes, and executed many drawings of the scenery of Russia, both in the northern and southern provinces. He made two journeys in the Crimea for the purpose of making etchings. One of these journeys was made in 1804 by the desire of the Emperor Paul, the second by the express permission of the Emperor Alexander, in 1806. Thirty of paintings and sixty sepia drawings, part of the fruits of the second journey, were purchased by the emperor, and placed together in a hall in Kamouo Ostrov. In 1818 Alexander sent Kugelgen for a similar purpose into Finland, of which country he painted fifty-five pictures, which also were purchased by the emperor. Kugelgen executed in all 171 pictures and 200 finished drawings. He died at Beval in 1832. His Life is in the 'Neser Nekrolog der Deutschen,' &c.' 1 (Nagler, 'Allgemeines Künstler-Lexicon.')

KUPETZKY, JOHANN, a very celebrated portrait painter, was born at Böding or Bonn, near Pragreb in Hungary, in 1867 or 1868. His father, originally of a Bohemian family, was a poor weaver, and he intended his son to follow his own business; Kupetzky however had very different intentions: he fled from home when only fifteen years of age, begged his way to Switzerland, and there, at Lucerne, obtained the name of Hans Imhof, and for some time with great success painted the portraits of the name of Klaus, who instructed him in painting, and was soon surpassed by his pupil. Kupetzky, after a time, found his way to Rome, where he underwent many hardships until he was reduced to beggarly straits. His friend Carl von Lichth potatoes at Vienna, where he soon obtained the reputation of the first portrait painter of his time. He numbered among his patrons and admirers the emperor Joseph I. and Charles IX of France, and in 1716 was appointed by Pope Clement XI. to paint the Great to Carlsbad. Peter wished Kupetzky to enter his service and to return with him to Petersburg, but Kupetzky was obstinately fond of his liberty, and would never accept his offer. He entered the society of the Bohemian Brothers. This liberty, however, very nearly involved him in serious difficulties, as he was accused or threatened to be accused, by some of his rivals, of malignant heresy; and Kupetzky was now a man of some importance in the tabernacle. He was accused of being a sympathizer of the Bohemian Society, and he secretly left Vienna and settled in Nürnberg in 1740. Kupetzky painted history and portrait, but chiefly portrait. His pictures have a great deal of character and much effect; his friend and admirer Fuseli says they combine the vigour of Rubens, the truth and elegance of Vandyck, and the effect of Rembrandt. Many of his portraits and some of his pictures have been engraved, especially by Bernhard Vogel, in mezzotint. Prints engraved by Vogel were added to be V. D. Freiselder and published in a collection in folio at Nürnberg in 1745, under the following title:—Joannis Kupetzki, inomparabilibus artificiis, imaginumque miniaturarum, et sepulcrorum ad quinque dodecages arte quam vacant nara acri inacise, a Bernhardo Vogelio, jam vero simillimae continuatiae opera et summoppeo Valentinia Daniellia Freiseldari, Chalcographo. Kupetzky's letters of himself, in which he certifies to the work of prodigious merit, has been copied by L. de Laborde, from Vogel's print and is inserted in a specimen in his history of mezzotint engraving—'Histoire de la Gravure en Mâtre-Or.'—L. Fuseli published a Life of Kupetzky, with one of Rugendas, at Zurich, in 1758. (Fiorillo, 'Geschichte der Zeichnenden Künste,' &c.; Dlabacz, 'Allgemeines historisches Künstler-Lexicon für Böhmen.') KUBDIN, JOHANN, was a landscape painter, who painted the larger portion of that mountain-region which divides the elevated table-land of Iran (Persia) from the low plains of Mesopotamia or Al-Jezireh. As it does not constitute a political division, its boundaries are not exactly determined. Some authors consider the country surrounding the lake of Van as forming a part of Kurdistan, but as that country is mostly inhabited by Armenians, and there are only a few Kurds among them, the mountain-range of the Erdoa Tagh (38° 20° N. lat.) must be considered as constituting the boundary-line between Armenia and Kurdistan. From this range it extends in a south-eastern direction to the province of Louristan, or to about 35° N. lat., the width of this mountain-range may be about a hundred miles. This gives an area of 28,000 square miles, or the extent of Ireland. About three-fourths are under the dominion of the Turkish sultan. The remainder belongs to Persia, and constitutes the province of Kurdistan, of which Kermanshah is the capital. The higher mountain-region occupies the northern portion, and extends from the Erdoa Tagh to the El Khoir Mountains; the south-west approaches the banks of the Tigris south of Jezireh-Ibn-Omar; from which point it extends in an east by south direction across the whole region, being overtopped near the boundary-line of Persia by the elevated peak of Rwandas (10,120 feet above the sea-level). This range is called at its western extremity, where it hardly rises a thousand feet above the sea-level, the Koli Range, but in the middle, where it attains 3000 feet and more, it is the El Khoir Mountains; it is still higher where it approaches the table-land of Iran. The whole country between this range and the Erdoa Tagh is mountainous. In the vicinity of Mounts Kuhistan the peaks are rare and not deeply furrowed by depressions in the shape of valleys. They form a table-land, from 6000 to 7000 feet elevated above the sea-level, whose surface presents a succession of broad hills succeeded by spacious valleys with great summits, and great plains between them. This is the table-land of Ali Bough, on which very few lofty summits rise. The climate is very dry, and the vegetation scanty. It is mostly used as pasture-ground and a few crops. In proceeding from west to east it gradually changes its features. The valleys sink deeper and the masses between them rise higher, and thus the table-land is changed into a mountainous country consisting of high ridges with steep declivities and depressions of narrow valleys between them. Some of the ridges attain a great elevation,
as the Marzanan mountains, the Jawur Tagh, and the Jelooch mountains. The elevation of the Baseb River is about 12,000 feet above the sea-level. The declivities of the ridges and the valleys present a vigorous vegetation in the numerous forests and in the growth of the different kinds of trees, such as oaks, trees, and hazel. The forests chiefly consist of different kinds of oak (Quercus valiosa and Q. infectoria), from which those immense quantities of gull-nuts are collected which constitute the most important product of the region. The wheat and the European cereals are raised; and the orchards produce apples, pears, plums, and cherries. Many of the valleys open towards the plain of Mesopotamia, and these are wider, but they do not contain as much cultivation as those which are more than two miles wide, and generally not half so much.

This portion of Kurdistania is in possession of some tribes of Kurds, which are independent when the pashas of Baghdad and Mosul are not in arms to punish the least act of disobedience. It is as difficult for the Turks to penetrate into the valleys of these regions as for the Russians to get possession of those of Circassia. Probably more than half the population are Mohammedans, and the other half Christians, among whom the Nestorians are the most numerous. Their patriarch resides in Julamerik, a small town situated in the vale of the river Zab Ala, or Great Zab, and enjoys almost the power of a sovereign. Near the southern extremity of this region are the towns of Amadiyah and Rowandiz, two places whence the gull-nuts are exported. Amadiyah lies in a valley from five to six miles wide and very fertile, and is built on high ground near the Zab, which descends below the level of the valley; it contains about 200 houses, many of which are inhabited by Jews. The town of Rowandiz is some miles west of the peak of Rowandiz. It is built on a tongue of land formed by the confluence of two rivers, and contains more than 1,000 houses and perhaps 10,000 inhabitants. Numerous caravans pass between this place and Mosul. They export gull-nuts, madder, hides, and tobacco, and bring back several European goods.

The southern portion of Kurdistania, or that which lies between 36° and 34° N. lat., can hardly be called mountainous, except in its eastern districts, which are contiguous to the elevated plains of Iraq. The surface however is greatly diversified by several ranges of hills. Three such ranges may be traced between the banks of the Tigiris and the eastern mountains. These three ranges go by the names of the Hamrin Hills, the most south-western, All Tagh, the central ridge, and Kara Tagh, the north-eastern. They run parallel to one another from north-west to south-east. The Hamrin Hills terminate on the banks of the Tigiris between the town of Tekrit and the mouth of the Zab Asfal or Lesser Zab (near 32° N. lat.); the All Tagh, south of the confluence of the Zab Ala or Great Zab (near 36° N. lat.); and the Kara Tagh, west of the Zab Ala or Great Zab. These ridges are connected with each other at several places by hilly tracts. It appears however that the greater part of this region is occupied by plains of considerable extent, which are either entirely sterile or possess only a soil of indifferent quality, but along the base of the hills, partly on their declivities and partly in the adjacent level country, there are lands of considerable fertility, well cultivated, and populous. The mountain-region which borders this country on the east varies from ten to twenty miles in width, and it contains several high ranges, as the Shabn mountains, the Azmir Tagh, and the Kurmur Tagh. In the second range the town of Zab Asfal or Omar Gudrun, an elevated mass which appears to rise above the snow-line, as it supplies the adjacent countries with ice all the year round. This mountain-region is united to the high masses surrounding the eastern Table-land of Iraq by the Zab, or Great Zab, which has about 7,000 feet above the sea-level; receives by its numerous affluents the drainage of almost the whole of Northern Kurdistania, enters Southern Kurdistania by a narrow gulf where the Kurmur Tagh meets the Khabur. It descends in a great regular gulf, and joins the Tigiris about 30 miles below Mosul. At the place of their confluence the rivers are nearly equal in size. The waters of the Tigiris are large and rapid, but in July, for about that season the greater part of the snow with which the mountain region is covered during the long winter dissolves, and thus the water brought down by this affluent serves during the summer to keep up the level of the Tigris. The water of the Great Zab is much colder than that of the Tigris. The other large rivers of Kurdistania are the Zab Asfal, or Lesser Zab, and the Diyala. They rise in the elevated region dividing Southern Kurdistania from the Table-land of Iraq. Not far from this first-mentioned country, they fall into the Tigris; they break through all the lower ridges of Southern Kurdistania.

There are several considerable towns in Southern Kurdistania. The most important is Artik (Al-Tur), which lies between the Great and Lesser Zab, in a plain which has a very fertile soil, yielding rich crops without being irrigated. The town is built on some considerable hills, which all travellers consider as of almost indescribable beauty. It contains large mosques, and two baths. Altun Kupri, on the banks of the Lesser Zab, contains 8,000 inhabitants. Kirkuk, farther south, is a rather large place, which carries on a considerable commerce with Sulaimanibagh, to which place it sends large quantities of gull-nuts, honey, sheep, and cattle, brought from the mountain-region lying farther east, and whence it receives European, Persian, and Indian goods. Its population may amount to between 10,000 and 12,000 individuals. There are some manufactures of coarse calicoes.

Suleimania, the modern capital of Southern Kurdistania, and the residence of the hereditary pasha or wali, who however is dependent on the pasha of Bagdad, is not far from the base of the Azmir range, and of the peak called Pir Omar Gudrun, which rises to more than 10,000 feet above the sea-level. The plain of Banna, at the eastern border of the landscape, on which it lies, is frequently watered, and contains more than 1,000 houses and perhaps 10,000 inhabitants. It was built in 1788, and contains more than 2,000 houses and about 10,000 inhabitants, six caravanserai, five baths, and five mosques. The commerce with the adjacent countries is considerable, and is carried on in this place.

Little is known of the climate of Kurdistania, except that of Sulaimania, where the winters are very cold and the summers very hot. Snow covers the plain of Banna for six weeks, or even two months. In May the climate is very agreeable, the thermometer standing at six o'clock in the morning at 66°; at half-past one, at 78°; and at ten o'clock in the evening at 68°. In July the heat is oppressive, especially during the north-eastern winds, which are called sherk, and which affect the human body more than the samouk at Bagdad, as they suddenly raise the temperature ten degrees and more, and produce the most unpleasant feeling. They continue to blow sometimes for eight or ten days, and return frequently, even as late as the end of September. When the sherk does not blow, the changes of the atmosphere are very regular in summer. At sunset it is quite calm; but immediately afterwards a light breeze begins from the east, which increases gradually until the sun attains the meridian, when it blows a gale, or at least strong enough to make the sails go. In July the wind turns to the west and moderates. The mornings are generally unpleasant, but the afternoons are very agreeable.

The fields of Kurdistania produce wheat, barley, and Indian corn; millet and sesame are also cultivated. Olive trees are planted towards the banks of the Tigiris. Tobacco and cotton are largely cultivated, and supply articles of commerce. Legumes, especially lentils, are much grown. Melons, watermelons, and cucumbers are very abundant. The orchards yield figs, pomegranates, olives, oranges, walnuts, apricots, peaches, plums, apples, pears, cherries, and abundance of grapes of good quality; in some places there are plantations of dates. Poplar and chinar trees (Populus orientalis) are planted, and among the forest trees are several kinds of oak, and also wild pear-trees of great size, and between them wild rose-bushes.

Sheep, cattle, and horses abound; the best horses are imported from Bagdad. There are bears, wild hogs, goats, antelopes, and jackals. Land-turtles are frequent, but of small size. Bees are very abundant, and honey is a considerable article of commerce; locusts sometimes lay waste a part of the country; birds are not numerous, except partridges and quails.

Minerals appear to be scarce, except building-stone. In the mountain-region iron and sulphur are met with; and in some places these mines are worked on a small scale. There are several salt springs in the hills between the lesser Zab and the Diyala, from which there are great quantities of salt, as well as of naphtha, which is used in the manufacture of dyestuffs. Naphtha and petroleum abound, especially in the vicinity of Kirkuk, and of some of the springs yield a considerable revenue to the wall; they are noticed by Strabo (p. 736, ed. Cas.).

Vol. II.—X.
As the passes through the ranges of mountains and hills are rather difficult, single travellers are subject to be robbed and murdered. Commerce is therefore carried on by caravans. At least one caravan departs every month from Sulaimanabad for the Persian towns of Tabriz and Hamadan. They take to Tabriz chiefly goods obtained from Bagdad, as coffee, dates, and European and Indian manufactures; and bring back large quantities of silk for the manufactures of Bagdad, and some silk stuffs. The exports to Hamadan consist partly of goods obtained from Bagdad, and partly of the produce of the country, as tobacco, fruits, honey, ginnuts, and the borax consisting of borax especially of the manufactures of Kusbin, as velvets, brocades, cotton goods, &c. The commerce with Kerkuk, which is the chief market for the produce of Kurdistan, is very active; from that place are brought to Sulaimanabad ginnuts, honey, sheep-skins, and cattle; and exchanged for fruits, rice, leather, coffee, cotton stuffs, &c. There is also much commerce with Bad-dad, where coffee, dates, and European and Indian goods are obtained in exchange for the silk brought from Tabriz, and for the produce of the country, consisting of sheep, ginnuts, sumach, cheese, butter, gymnou, tallow, soap, and tobacco. These articles are also taken to Mosul, where they are exchanged for calicoes and other cotton stuffs, silks of Damascus and Diarbekr, stuffs for turbans, boots, and shoes.

The least active branch of the commerce of Sulaimanabad is that with Erzerum, to which place hardly anything is exported except those articles which are imported from Bagdad, for which the returns are iron, copper, and mules. Armenia supplies the whole of Kurdistan and some neighbouring countries with these animals.

The population of Turkish Kurdistan is estimated at about one million, of which four-fifths are Kurds, and the remainder Armenians, Persians, Jews, and Turks. The Kurdish popula-
tion of Persia in Kurdish may amount to 20,000 individuals. But as a numerous colony of Kurds is found in Khorasan, and several tribes have also been dispersed over the hilly region in Mesopotamia, and as far west as Aleppo and the Taurus mountains, the whole population of the nation may perhaps not fall short of two millions. The Kurds are a stout race of men, of dark complexion, with black hair, a large mouth, small eyes, and a savage look. They are very regular in their habits, and are great believers. Their language is derived from the same stock as that of the modern Persian, but not having been fixed by writing, it has degenerated much more. There are several dialects, which vary considerably in proportion to the distance at which the different tribes live from one another. The name of Kurd signifies a valiant warrior, and is therefore adopted as an honourable designation. In Turkish Kurdistan the nation is composed of two castes, the warriors, called Bebebhr or Balaks, and the working people or agriculturists, called Garun. The latter are considered by the Bebebhr as a race of men totally different from them, and are treated as such. The Bebebhr never cultivate the ground, and the Garun never serve as soldiers. A great portion of the population is still addicted to a migratory life. Even when settled in villages, they leave them in summer, and return with their flocks to the adjacent mountain-ranges, from which they return when the harvest time approaches. Though the Kurds are as good Moham-
edians as their neighbours, their women enjoy a much greater degree of liberty, and are frequently met with in the streets. Ladies of rank wear a veil, but the women of the middling and lower classes go out without. The Kurds are much more inclined to associate than their neighbours the Persians or Turks.

The Kurds were known to the ancients. Xenophon (Anabasis, iii. 5, 15, &c.) called them Carduchi (Kapodiaces), and later historians Kapodias, Topodias, Gordiani. When subject to the kings of ancient Persia, they belonged partly to the province of Assyria, and partly to Media, as at present their country is divided between Turkey and Persia. The battle of Gaugamela (Arraca) was fought in Kurdistan, near the modern town of Arbil. After the time of Alexander their country was subjected to the kings of Media, who were dismembered from it in the third century before Christ by the Parthians. It afterwards became a part of the new Persian empire, and was included under the dominion of the caliphs of Bagdad. After the destruction of the Parthian partook of the numerous revolutions in Persia and Mesopotamia. The famous sultan Saladin was a Kurd, of the tribe of Roudhindis, and appeared to have got possession at least of a part of the country. But it soon passed under the dominion of the Moguls (1258), and finally (1588) was conquered by Timur. After the establishment of the Soolkhe dynasty (1602), Kurdistan constituted a part of Persia, and remained so till the seventeenth century, when the Kurds, oppressed by the Persians, revolted, and subjected themselves to the dominion of the Turkish emperor.

Kyd, Thomas, was one of those dramatic poets who immediately preceded Shakspeare. Three plays of his are extant—'The Spanish Tragedy,' 'The Fair Cornelia's Tragedy,' a translation, respectively executed, from the French of Garnier, printed in 4to. 1594, 1595; 2; 'The First Part of Jeronimo,' 1605, 4to.; 3. 'The Spanish Tragedy, or Hierosolyma,' is marked as having been translated, but there are several editions, the oldest known being of 1599, though the play was certainly printed earlier. All the three are in Dodgely's Old Plays. 'The First Part of Jeronimo' is merely an Introduction to the 'Spanish Tragedy.' The former, and probably the latter also, must have been on the stage about the year 1587 or 1588; and they kept their place in 1601 and 1602, when Ben Jonson was paid for making large additions to the Second Part, which are in the modern editions and are quite worthy of his genius. The portions written by Kyd himself are the objects of continual ridicule to Shakspeare and his contemporaries, whose comic characters parody the most extravagant speeches of the tragedians. Yet the play, even in its Introduction, and still more in the Second Part, possesses great vigour, both of imagination and of passion. It is an irregular and rude work, belonging essentially to the infancy of the modern drama, and the conception of its theme and in its language. But it was by no means unworthy of the great popularity which it enjoyed. It is a tragedy of bloodshed, and the writer of 'Titus Andronicus,' to which, however, it is much inferior; it has been observed by more than one critic, that there are in it points which may naturally enough be supposed to have suggested thoughts for 'Hamlet.' Kyd has also been supposed to have been the author of the old 'Taming of a Shrew,' 1594, and of the tragedy of 'Solyman and Perseda, 1599. For the former support there is no ground; and for the other there is no better reason than the particular mention made of the story of a 'Solyman' in the 'Spanish Tragedy.'
L.

LAACHER SEE. (ANDREASCH, P. C.)

LABEO, QUINTUS ANTIUSIS, A Roman of some distinction as a lawyer. It is said that he was born at Philippi, on the side of M. Brutus and Cassius, and after the defeat he killed himself in his tent, and was buried there. (Appian, Civ. Wars, iv. 2. 5.) Labeo was a distinguished lawyer; but contrary to the practice of that time, instead of devoting himself exclusively to one master, he attended several. He lived in the time of Augustus. Labeo was distinguished for his knowledge of Roman law and Roman usages, and also for the freedom with which he expressed his opinions to Augustus (Suetonius, Octavianus Caesar, c. 54.), to whose measure he set himself in opposition. Some critics suppose that he is alluded to by Horace (I. Sat. III. 82), and there might be other persons of the name of Labeo. Atius Capito, his rival in legal knowledge, was raised to the consulship by Augustus in order that he might have that superiority in rank which his talents alone could not give him. Labeo never enjoyed any higher honour than the praetorship. (Tatius, Annu. iii. 75.) The character of Labeo is given by Gallius (iii. 10): 'Labeo Antiusius principally applied himself to the study of the civil law, and publicly gave his opinions to those who consulted him. He was also not acquainted with other liberal pursuits, and he deeply studied grammar, dialectic, and ancient learning; he was also well acquainted with Greek and Latin words, and he advised himself of that kind of knowledge especially to clear up most legal difficulties.' He was confident in his abilities and acquirements, and bold enough to advance many new opinions. He was a copious writer, and is said to have produced four hundred different treatises, from which there are sixty-three excerpts in the Digest, and he is very often cited by the other jurists. Labeo wrote commentaries on the Twelve Tables, fifteen books at least on Pontifical Law, and fifteen De Disciplinis Et Reris. His works which are mentioned in the Digest are, eight books of Hierarchia, of which Paulus made an epitome with additions; and ten books of Posteriora, so called from having been published after his death, of which Javenus made an epitome; but Gallius refers to the fourth book of Posteriora. He also wrote Libri ad Edictum, Libri Pratica Urani, and thirty Libri Pratica Peregrini.

A brief notice of C. Atius Capito may be appropriately introduced here, for he was the rival of Labeo, and founded a sect or school which was opposed to that of Labeo. The father of Capito was an orator; his own name has left a centurion who served under L. Cornelius Sulla. Capito was made Consul Suffectus by Augustus A. D. C. 738, and it was during his term of office that he decided that a patron could make his freedwoman to wife against her consent, a decision perfectly consistent with Roman principles. Capito was a flat-tarer; Labeo was an independent man and said what he thought. Instances of Capito's adulation are recorded by Tacitus (Annu. iii. 76) and Suetonius. He died in the time of Tiberius, A. D. 29. (Annu. iii. 75.)

Capito is often cited by other jurists, Proculius, Javenelius, Paulus, and once by Labeo: they always call him Atius. Capito's reputation as a lawyer was very great. He wrote on Pontifical Law at least five books, as appears from Gallius (iv. 6), and numerous books of Conjectures (Gallius, xx. 2; xiv. 7). He also wrote a single book De Oficio Senatorio, from which Gallius gives an extract (iv. 10), and a book De Jure Sacrificiorum (Macrobius, Saturn. iii. 10). Gallius (xiii. 12) also quotes a letter of Capito, in which he speaks highly of Labeo's legal knowledge. There are no excerpts from Capito in the Digest.

From the time of Labeo and Capito we date the formation of two opposed sects or schools of law among the Romans. The nature of this opposition is collected from the words of Proculius. (Lec. 2. 9.) The differences centre in greater acquirements than Capito and of a bolder temper. He applied to his legal studies the stores of knowledge that were open to him, and thus was led to many new views. Capito stronglyd emphasised the fact that he was one of those who appealed to authority. So far as concerns general principles, we cannot condemn the method of either of these great jurists. Each has its merit, but either of them, if carried too far, may be injurious to jurisprudence. He who handles the matters of law in an enlarged and comprehensive manner, is more likely to arrive at true results; but he who does not well know what the law is, and if he is more eager to change what is established than to maintain its stability, he may destroy the edifice on which he is labouring. He who merely studies the law of Tullius, will be satisfied if he can find authority for anything, however inconsistent with fair dealing and the general interests of society, may be a good lawyer of a kind, but he is a bad citizen. The Roman jurisconsults were mainly engaged in writing on law and giving their opinions (responsum) to all persons who consulted them. Their business was not that of the modern advocate, who has to make the best of his client's case. The opposition then between Labeo and Capito, between him whose method, if judiciously practised, would lead to a progressive improvement of law, and him whose method would stop all such improvement, if strictly adhered to, hardly constitutes a ground of like comparison between lawyers in this country. Numerous questions divided the respective followers of Labeo and Capito; but it is not always easy to discover in the questions, so far as we know them, sufficient to enable us to trace the two opposing principles of the founders of the schools to their just consequences. Much has been written on this matter; and a great deal has been said for which there is little or no evidence.

The followers of Labeo were called Proculian, from Proculius, one of the successors of Labeo. Those who attached themselves to the school of Capito were called Sabinius, or sometimes Schola Cassiana, from Massarías Sabinius and C. Cassius Longinus. For further remarks on the subject of the schools the reader may consult Pucht, Carusus Institut., i. 98. LAMBEAU (LAMPIADE, P. C.) LABIDUS (MULTEIDUS, P. C. S.) LAPIX (P. C. S.) LAVROPHANTHODON, a genus of fossil reptiles from the new red-sandstone strata. (Owen.) (SALAMANDROIDES, P. C.) LACER-TREK. (DAVIES, P. C.) LACPRO (LACRUM, P. C.) LACTICUM, a genus of plants belonging to the natural order Composite, the suborder Lighflorine, the tribe Cicennacae and the subtribe Lactueae of the Crucifolae. It has a cylindrical inbrinated involucre with involuntions at the margin and few-flowered; the receptacle naked; the achenium compressed, wingless, with a long filiform beak, the pappus hair-like in several rows. L. cressa, And. Lettuce, has leaves with a prickly keel, horizontal, oblong, auricled and clasping, mucronate, dentate or sinuated, the beak white, equaling the fruit, which is black. This plant is found on hedges, old walls, and the skirts of fields throughout the whole of England. It is generally grown when procured and dried has the name Lactucarium. (LAC- TUCARIUM, P. C.) This substance is also procured from the garden lettuce (L. sativa), and in the London Pharmacoepoeia the L. sativa is the only plant recognised for supplying this substance. Dr. Christian remarks, 'the London College however, and many cultivators, are wrong in restricting themselves to the garden lettuce, for the preparation of lactucarium.' From information communicated to me several years ago by Mr. Duncan, chemist and druggist in this city (Edinburgh), who has often made lactucarium on a large scale, it appears that the Lactuca virosa yields a much larger quantity, and that the product is of a superior quality. Nor is there any reason for dredging the narcotic properties of the wild lettuce, the scientific name of which has given rise to an exaggerated notion of its activity. The results obtained by Mr. Duncan have been since confirmed by those of Schults in Germany; who found that a single plant of the garden lettuce yields only 17 grains of lactucarium on an average, while a plant of wild lettuce yields no less than 66 grains. — Mr. Duncan has made the observation also that, although the milkiness of the juice increases till the very close of the time of flowering, namely in the wild-lettuce till the month of October in this climate, the value of the lactucarium is determined by the period of its annual flowering: this increases consequently while the juice becomes thicker a material decrease takes place in the proportion of bitter extract contained in it.' For an account of Lactuca sativa and its uses as a salad, see X.2.
Lettuce. This plant appears to have been introduced among the Greeks, and also used in medicine. It is the spatha of Dioscorides, 2:2, and was used by the garden-lettuce were both used among the Greeks and Romans as salads. L. sarvola, Prickly Lettuce, has the leaves with a prickly kind of stem, and is used in salads, as is the oak-leaved lettuce, which is composed of a similar kind of stem, the base white, equaling the pale fruit. It is found plentifully in waste places in many parts of Europe, but is a rare plant in Great Britain. It has a stem from 2 to 4 feet high, leafy and panicked. Its juice is not so acid as that of L. virgata, but possesses the same properties. It is found on the higher hills of Greece, and is probably the spatha of Dioscorides and Spalernian of Dioscurides. The spatha of Theophrastus, B. and of Galen, 2, according to Fras is the L. coriaceae of Scluthus.

There are two other British species of lettuce: L. salignum, with a white elongated base, twice as long as the fruit, the upper leaves entire, acuminate, and L. ericifolius, with the base much shorter than the fruit. [On the Cultivation of the Lettuce, see Lettuce, P. C. J.]

(Babington, Manual of British Botany; Fras, Synopsis Plantarum Flora Classicæ; Christian, Dispensatory.)

LADING, BILL OF. [BILL OF LADING, P. C.)]

LAGENARIA (from 'lagen,' a bottle), a genus of plants belonging to the natural order Cucurbitaceae. The flowers are white, the calyx campanulate, the calyx segments shorter than the tube. The corolla is white, with oboteate petals spreading below the edge of the calyx. It has five triadaphous stamens, the fifth one distinct; three subterminal, two terminal, oblong compressed seeds tufted at the margin, 2-lobed at the apex.

L. vulgaris, common Bottle-Gourd, is a musky-scented plant, and clothed with a soft down. It has a climbing stem with tendrils from 6 to 4 feet long. The fruits are spherical, smooth, and in clusters; the fruit in shape like a bottle, when ripe of a pale yellow color, sometimes six feet in length. When dried it becomes hard, and is used to contain water; it is then of a pale brown color. In its wild state the plant produces a poisonous fruit, and Dr. Rayle states that a very intelligent native doctor informed him that cases of poisoning have occurred from eating the bitter pulp in the district where it grows. Some sailors also are said to have died from drinking beer that had been standing in a flask made from one of those gourds. These injurious effects seem however to be removed by cooking, for Don says that the poor people among the Arabsians eat it boiled with vinegar, or fill the shells with rice and meat, and so make a kind of pudding of it. The pulp of the fruit is often employed in soups: it is bitter and purgative, and may be used instead of coloquint. This species grows wild on the west coast of Africa and on the Arabian coast of the Red Sea. It is cultivated in the neighborhood of the town of Charran; it thrives wherever the mountains are covered with a fit soil. There are three other species enumerated by Don growing in Guinea and the East Indies.

In India it is a great reversion by the Hindus in their religious ceremonies.

(On, Gardener's Dictionary; Lindley, Flora Medica.)

LAGERUS (from Leuc, a hare, and ed, a tail), a genus of plants belonging to the natural order Grumineae. It has a spiked pedicle 1-flowered, scarious glumes ending in a long fringed seta. The outer pale end in two long setae and with a dorsal geminated twisted awn.

L. coerules, the only species, and has a stem from four to twelve inches in height. The leaves are broad and lanceolate, the spikes ovate and subovate. It is found in sandy places in Germany and on the Continent of Europe.

(Babington, Manual of British Botany; Koch, Flora Germanica.)

LAI, MALCOLM, an historian, was born in Orkney, where he possessed a small patrimonial estate, in 1762. He received the rudiments of education at Kirkwall, and afterwards studied at Edinburgh, where he was one of the most active members of the 'Scrupular Society'; an association in which he was prominent, while he was a student. He first tried their prowess. In 1785 he joined the Scotsbar. He does not appear to have obtained much practice as a writer, but he only conscious occasion in which he was professionally employed seems to have been in the defence of some of the parties tried for sedition in Scotland between 1798 and 1799. He is one of the many instances where lawyers have in their works displayed particularly high forensic abilities, without, for some inexcusable reason, being able to rise in their profession. His first known literary effort was editing the last volume of Henry's 'History of Britain,' in 1798, after which he published 'The History of the War in America on the Death of James VI. to the throne of England, to the Union of the Kingdoms in the reign of Queen Anne.' This was published along with two other works, the names of which appearing on the title of the History, are very characteristic of Laing's propensity to enter on disputed points in history or criticism with the spirit of a lawyer. The History as published in two volumes was accompanied by 'Two Dissertations,' both of which were critical, on the supposed Authenticity of Ossian's Poems. Neither of these subjects came within the scope of his History—the former related to a period thirteen centuries earlier. To the second edition of his History, published in 1804, he added a 'Preliminary Dissertation on the Participation of Mary Queen of Scots in the Murder of Darnley.' He was a sagacious, honest, and able historical critic, but certainly too much inclined to take up a side in any question and to keep perpetually in view the circumstances that he was bound to defend that side. His style was harsh and formal, and sometimes obscure, from a pedantic adoption of the mode of his author. He was frequently upon the bosom of his subject, and often too much to him. He was for some time member of parliament for Orkney, and enjoyed the confidence and esteem of Fox. He died in 1818. His brother Samuel Laing, who has written some interesting memoirs, succeeded his brother in the seat. LAMBERT, JOHN HENRY, a distinguished philosopher of Germany, was a descendant from a family which had been compelled to quit France in consequence of the persecutions caused by the revocation of the Edict of Nantes, and he was born at Mühlenhausen in Upper Alsatia, August 29, 1728. He was sent to a school in the town, where he acquired the rudiments of a classical education; but the want of means obliged his father to let him trade a tailor, to withdraw him from thence at an early age.

At home, however, the youth availed himself of every means in his power to preserve the knowledge he had acquired of the Latin tongue; and a great part of each night was spent in reading such of the Roman authors as he could procure, or in studying arithmetic and geometry; the money for the purchase of the books, and even of the candles by whose light they were read, being obtained, it is said, by the sale of drawings which he found time to execute. A taste for literature and science in a young person so situated did not fail to attract notice; but the only immediate advantage which resulted from his attainments was the neatness which the practice of transcribing had given to his hand-writing: this qualification procured for him an appointment as a clerk in the office of a solicitor; and he was afterwards employed, in a like capacity, by the most prominent men in the neighbourhood. At seventeen years of age he became the secretary of Dr. Iselin at Bale; and during the five years in which he held this situation he omitted no opportunity of extending his literary attainments. He then, also, began to acquire a knowledge of philosophy and logic by the study of the works of Locke, Malebranche, and Wolf; and zealously cultivated the mathematical sciences, in which alone, it is observed, he found that the processes of investigation lead directly to truth. In 1749 his patron recommended him to M. de Salis, who was then the President of the Swiss Confederacy, as a tutor to his children; and, having obtained the appointment, he went to reside with the family of that statesman at Coire. Being thus placed in a situation congenial with his taste, and having access to a considerable library—enjoying, moreover, the opportunity of conversing with learned men—he was enabled, while communicating instruction to his pupils, to study the Greek, Italian, and French languages; and particularly to advance his knowledge of optics, astronomy, and philosophy. He was invited to become a member of the Physico-Medical Society of Bale, to whose 'Acts' he afterwards contributed several memoirs on mathematical and physical subjects.

In 1757 Laubert accompanied two of the sons of M. de Salis to the University of Göttingen; and, proceeding from thence to Holland and France, he returned in 1758 to Coire. At Paris he had an opportunity of conversing with some of the celebrated men of the age, particularly D'Alembert and
LAM 135

LAM

Messier; by the former of whom he was afterwards recom-
dended to the King of Prussia, Frederick III. He quit-
ted the family of Count Salm in 1758, and, having been chosen a
member of the Elector Academy of Bavaria, he went to reside
at Augsburg, where he proceeded to Berlin, where he passed the
remainder of his life. He was elected a member of the Berlin
Academy of Sciences, to whose 'Mémoires' he made
many valuable contributions; and he was also appointed
Chief Astronomer to the Academy, in the establish-
ment of a commission for superintending the improve-
ments of the kingdom.

While in Holland, Lambert published, at the Hague, a
tract entitled 'Les Propriétés de la Route de la Lune,' 8vo.,
(1758), in which he examines the path of a ray of light
refracted in the atmosphere, and points out some corrections
which should be made, on account of refraction, in deter-
mind the heights of mountains; and in the following year he
published at Zürich one which was designated 'Freys Per-
pective.' But one of the most important of Lambert's works
is his 'Phosphoria, sive Methodus et Gratulatio Lucis Colorum, et Umbrum,' which was published both at Leipzig
and at Augsburg in 1760. In this treatise the author states, from
his own experiments, the quantities of light reflected from the
exterior of the earth. It was received with delight and honor by
representing them. He compares the brightness of illu-
ninated objects with that of the body which enlightens them;
and he discusses the brightness of the image formed by a lu-
ninated object, and in this work he treats of the influence of
the degrees of illumination on the different planets; and he
describes instruments for measuring the intensities of dif-
ferently coloured light.

In 1761 he published at Augsburg a valuable work entitled
'Insigniores Orbitae Comentarum Proprietates,' 8vo., in
which he contains a formula for determining, in a parabolic orbit,
the perihelion distance in terms of two radii vectores and the
distance of the sun itself. In this work the orbit being any conic
section, the interval between two times of ob-
ervation is expressed in terms of the two radii and the chord
which joins their extremities. This is usually called 'Lam-
bert's Theorem,' and it was certainly discovered by him,
though Euler had, long before, given a like theorem for a
parabolic orbit. In the same year Lambert published at
Augsburg a small work entitled 'Logarithmicae Rechen-
strnadls,' in which are proposed some improvements on Gunter's
'Scale'; and one entitled 'Cosmologische Briefe uebcr die
Einrichtung des Welthaus,' 8vo., in which he considers that
the power of gravity extends to the fixed stars; and he ex-
presses a conviction that the system of the world is
built up from a system of satellites with respect to some celestial
body.

In 1764 was published, at Leipzig, in 2 vols. 8vo., Lam-
bert's work entitled 'Neues Organon;' this work is divided into four parts, of which the first contains a treatise on
thinking, and the second is on truth considered in its ele-
ments; the third is on the external characters of truth; and
the fourth, on the means of distinguishing the real from the
apparent. A sort of supplement to this work was published
by him at Riga in 1771, in two volumes 8vo.; it is entitled
'Architektonik,' and treats of the metaphysics of mathematics;
the subjects being Unity, Number, Dimensions, Continuity,
Limits, and Infinity.

The first mathematical work which Lambert published after
he went to reside at Berlin was his 'Beyträge zum Gebräuche
der geographischen Stereographie,' 12mo. (1773). He then
edited the work of his former teacher, John Bradley (1718 to
1779). This contains some profound investigations relating
to the theory of numbers, and a tract on trigonometry, with
notices on what is called tetragonometry; in it are given also
some important propositions relating to the projections of
the sphere. In the first of those years he published 'Description
d'une Table Ecliptique formant un Tableau vrai de toutes les
Éclipses, tant de la Lune que de la Terre;' and in 1770 ap-
ppeared another of the same nature entitled 'Tableau du
triennes Tabellen,' 8vo. He was joined with Bode, Schultz,
and Lagrange in the publication (1776), under the direction
of the Academy of Berlin, of a series of Astronomical
Tables.

Lambert also wrote a tract on 'Hygrometry,' which was
published at Augsburg in 1770; and he left one on Pyrome-
try, which was published at Berlin, in 1779, that is after his
death; this last contains a biography of the author, by Ever-
hard. Besides these works Lambert wrote numerous papers
on scientific subjects, which were published in the 'Acta
Helvetiae' and in the 'Mémoires' of the Academy of Berlin.
Among the 'Acta' he is the 'Testamen de Vi Caroli eiusque
Dimensione a Saucierio Sculpsit,' and which was
afterwards generalised by Lagrange, and a 'Memoir sur Vibrat-
stringing.' The 'Mémoires' of the Academy contain his
papers on the Incommensurability of the Circumference of a
Circolo to its Diameter; on Hydraulica; Wheels; on Windmills; and on Friction. He moreover pre-
pared two papers in which he had discussed all the known ob-
servations on Jupiter and Saturn; and these were published in
the same 'Mémoires' (1780) which contains the estab-
lishment of a commission for superintending the improve-
ments of the kingdom.

Lambert was endowed with a strong memory and a fertile
and well regulated imagination: his manners were simple, and
he is said, in his dress, to have disregarded the fashions of the
time; but he was both esteemed and beloved by those who
knew him intimately. He died Sept. 25, 1777, being
then only forty-nine years of age. All the manuscripts left
by him were purchased by the Academy of Berlin, and were
subsequently published by John Bernoulli, a grandson of the
celebrated John Bernoulli of Basle.

(The Berlin Mémoires.' Biographie Universelle.)

LAM, GIOVANNI, born at Venice, in Tuscany, in 1697, studied law at Pisa, took a doctor's degree, and after-
wards repaired to Florence, to exercise his profession. But
his fondness for literature, and especially classical and ecle-
siastical studies, diverted him from the profession of a
lawyer, and he became an author. His first work was in defence of the
Nicene Creed concerning the Trinity, and against Leclerc
and other Socinian writers. Lami contended that the Nicene
Doctrine and the dogma concerning the Trinity were but
the early promulgations of Christianity in the Apostolic times.
His work is entitled 'De recta Fatum Nicenum Fide,'
Venice, 1730. Lami travelled with a Genoese nobleman to
Vienna, where he resided some time, and he afterwards visited
France, whence he returned to Florence in 1732, where he
was made librarian of the Riccardi library, and Professor of
Ecclesiastical History in the Florence Lyceum. At Florence he
published 'De Ecclesiologia,' 8vo. Florence, 1738, which is a sort of continuation of his former work.
The Socinians having assumed that the notion of the Trinity had been derived from the 'Logos' of Plato, Lami
undertook to prove, among other things, that the apostles and
their first disciples were too ignorant of profane learning to
be acquainted with the writings of the Greek philosophers.
Lami's work also contains much miscellaneous and recondite
erudition concerning the early ages of Christianity.
The author treat's the style of dress, and of the manners of
the primitive Christians, of the amusements of the apostles, and
of the early translators of the Gospels and Epistles, of the
cryptical books and libraries of those times, and lastly he gives an historical account of the old MSS. of
the Gospels, Epistles, and other parts of the New Testa-
ment which existed in the libraries of Florence.
In 1740, Lami was named to a new library journal, entitled
'Novelle Letterarie,' which he carried on till the year 1760,
at first with the assistance of Targioni, Gori, and other learned
Tuscans of his time, with whom he afterwards quarrelled, and
he then continued the work alone. This publication was
the source of some annoyance to him, both from private animosity
and from the jealousy of the censorship.

Lami made a selection of edited works, or fragments of
works, from the MSS. of the Riccardi library, of which he
was keeper, and published it in a series entitled 'Delizia
Eruditorum,' 16 vols. 8vo., Florence, 1736—69. He also
published the work of John Bradley in 12 vol.
folio. He wrote short biographies of many illustrious Italians
of his age: 'Memorabilia Italorum Eruditione prestantium
quibus vertens Seculum gloriarun,' 2 vols. 8vo., Florence,
1743—7. He published in Greek the letters of Gabriel
Severus, Archbishop of Philadelphia in Asia Minor, and of
other Prelates of the Greek Church: 'Gabrielis Severi et aliorum Graecorum Recentiorum Epistolae,' 8vo.,
Venice, 1754. He had contributed a verse to a song on
Churches from the Council of Florence of 1439; a subject
which he observed had been much neglected by writers of
ecclesiastical history; but this undertaking was interrupted by
Lami's death, which occurred in the year 1773, in the church of Santa Croce; and the following sentence was
engraved on his tomb: 'Doctissimi Polyhistori etatis suae
nulli secundus.' He left all his property to the poor. Fabbroni
and Fontanini wrote his biography. Besides the works already
mentioned, Lami wrote satires both in Latin and in Italian, especially directed against the Jews, whom he strongly disliked. He also published, 1, ‘Lezioni di Antichità Toscane,’ 2 vols. 4to., 1766. 2, ‘Ricordi Romani richi di Vita,’ Florence, 1748. 3, ‘Catalogus Codicium MSS. qui in Bibliotheca Florentini Fidei, seu in Bibliotheca Universitatis Florentinae, & Bibliothecas tav. & Annalium,’” 1756, and other minor writings.

(Corniani, I Secoli della Letteratura Italiana, and the works of Lami above quoted.)

LAMIUM, a genus of plants belonging to the natural order Labiatae. It has a 2-lipped corolla, the upper lip arched, lower lip trifid. The lateral lobes minute, tooth-like, or obsolete, rarely elongated. The anthers approach in pairs, and the stamens are inserted at about a right angle to the axis of the corolla. The calyx is 5-toothed and holl-shaped, the teeth nearly equal. This genus includes the dead, blind, and dumb nettles of our peasants, so called from their resemblance to the Urbin in many points, except their stings.

*L. amplexicaule* has roundish corolla obtuse leaves, the lower ones stalked, the upper ones sessile and clasping; the teeth of the calyx are longer than the tube at length convolute, the lateral lobes of the lower lip of the corolla toothless; the nuts small, and of an oblong oblong shape. It is found in sandy and chalky fields in Great Britain, the North of Africa, and Middle Asia.

*L. amplexicaule* differs from *L. amplexicaule*, obtuse leaves, and is distinguished by the teeth of the calyx being longer than their tube, hispid, and always spreading. The lateral lobes of the lower lip of the corolla with a short tooth, the teeth being longer than those of the former species, and of an oblong shape. This species is common in Scotland, Sweden, and the North of Germany.

*L. purpureum* has a pale purple corolla, spotted with red, the lateral lobes of the lower lip having 2 teeth. The nuts oblong, or about twice as broad as long. It is found in Great Britain and Sweden, where, according to Linnaeus, it is boiled and eaten. It was formerly used in medicine, but is not used now.

*L. incisum* has but one tooth in the lateral lobes of the lower lip of the corolla. It is a British plant, and is likewise found in France, Germany, and Sweden.

*L. album* is distinguished by having the calyx teeth as long as the tube, all separated by acute angles, the upper one distant from the others. The corolla has 3 teeth, and is large and white. It was once used medicinally, but is now disregarded. Like *L. purpureum*, this species is eaten in Sweden as a pot-herb. It is found in Great Britain and the southern parts of Europe.

*L. maculatum* has the calyx teeth longer than their tube, the upper ones separated from the others by broad obtuse angles; the lateral lobes of the lower lip of the corolla with one tooth. It is found in Great Britain and the continent of Europe.

*L. striatum* has deeply cut ovate leaves, the corolla 3 times as large as the calyx, which is glabrous. It is a native of Greece in waste places, and is supposed by Fraas to be the same as *L. striatum* var. *quadrifolia*, 9, 105.

There are several other species of Lamium, growing chiefly in the southern parts of Europe. They are not worth cultivation for ornament, but will easily grow in any soil or situation, and are to be propagated either by division or by seed.

(Don, Gardener’s Dict.; Babington, Mon. Brit. Bot.; Fraas, Synopsis Plantarum Floreae Classicarum.)

LAMOTTE. [Matté, L., P. C.]

LAMP (Lights, Artificial, P. C. S.)

LAP (Laws) COUNTY PALATINE OF. [Palatine Counties, P. C. S.]

LAND. [Taxation, P. C. C.]

LANDTAX (LANDTAX) TENANT AND LANDTAX. [TENANT AND LANDTAX]

LANGBAINE, GERARD, D.D., born in Westminster about 1608, was successively a servant, scholar, and fellow, of Queen’s College, Oxford; and he held the places of keeper of the archives of the university and provost of his college for a good many years before his death, which happened in 1658. He was a studious and timid man, who contrived to steer through the political storms of his time without giving serious offense. He lived Longinus, and published several works of his own chiefly on church questions. But his chief usefulness was in his unprinted collections, which included several catalogues of manuscripts, often referred to by Warton and others.

GERARD LANGBAINE, his son, was born at Oxford in 1656, and, after having received an elementary education, was apprenticed to a bookseller in London. An elder brother having died before his time, he became his father’s heir, and was a commoner of University College. He betook himself however to idleness and low extravagance, and spent a great part of his property; but after a time he reformed, and regained of his earlier tastes but his love for the theatres. He made a very large collection of old plays, amounting, as he says, to almost a thousand. He made use of these, first, in a republication of a catalogue of plays made by Kirkmann, a collector of old books, but who had exhausted its stock, ‘Folium et umphans,’ 1687, 4to. This work, speedily sold off, was improved into ‘A New Catalogue of English Plays,’ 1688, 4to. Still further additions and amendments produced his ‘Account of the English Dramatic Poets,’ 1691, 8vo, 1699 (by Gilson), 1719 (by Giles Jacob, for Curll). The criticism contained in this work is shallow, prejudiced, and obsequious. The author pronounces Sir Robert Howard to be an admirable poet, and prefers Shadwell’s plays to Dryden’s. But, in relating facts and describing editions, he scrupulously sets down what was before him; and although the information he gives is very incomplete, his work is the most trustworthy of our stocks of old plays during that period. He is the only bookseller employed in the purchase of the gallery of the Duke of Mantua, for which Charles gave 20,000.—it comprised the Triumph of wit and speech by Mantegna. [HAMPTON COURT PICT.

LAP (Laws) GALLERY, P. C. S.]

Laniere was a better musician than a painter. He was appointed in 1626 Charles’s chaplain-master, for which he had a salary of 200l. per annum; he was also closet-keeper to Charles. There is in Ben Jonson’s works a masque, which was performed in 1617 at the house of Lord Hay, for the entertainment of the French ambassador, and for which Laniere both painted the scenes and composed the music. He also wrote and set the hymns which were written by Thomas Fierce for the funeral dirge of Charles I.

Laniere lived to see the dispersion of the collection which he himself had been mainly instrumental in forming. He purchased many pictures at the sale of 200l., others were purchased by his brothers Jerome and Clement. Laniere appears to have been a general dealer in pictures, and, according to Sanderson (Gra. 210), to have been keen of art for a long time, and that sc.Vector employed him in the purchase of the gallery of the Duke of Mantua, for which Charles gave 20,000.

polcnon, the Duke of Wellington, and Marshal Ney and Soult. He was born of humble parents, and was at first hired as a day labourer. In 1786, having joined a battalion of volunteers raised in the department of Gers, of which he soon became sergent-major. His first campaign was with the army employed on the frontiers of the Pyrenees. In 1792, at the suggestion of its living father, he had obtained the rank of ‘chef de brigade,’ which nearly corresponds to that of major among the English troops. After the political crisis of the 9th Thermidor (July 27th), 1794, he partook in the destinies of the new régime. On that occasion, he quitted his native region, and accomplished his ambition, by uniting their connection with the younger Lobespierre; he then retired to Paris, where he formed an acquaintance with those two distinguished commanders, whose future glories he was destined to share. His calm and daring character especially attracted the notice of Bonaparte, who employed him in the affair of the Sections [BONAPARTE, P. C.], and he afterwards joined him with the army of Italy. After the victories of Montenotte and Milleisano, April 26th, 1796, where he greatly distinguished himself, he was made colonel of the thirty-second demi-brigade, in the place of the gallant Rampon, who was raised to the rank of general. Among his many duties, in the capacity of a minister of Simonsen, he had occasion to cross the river Po, he was the first with a few grenadiers to arrive at the opposite bank; and likewise, on the bridge of Lodri, he was foremost in effecting the perilous passage. In 1797 he entered the camp of Vienna in command of a detachment with distinction till the signing of the treaty of Campo Formio. [CAMPO FORMIO, P. C.] He afterwards formed part of the expedition to Egypt, where he rose to the rank of a general of division, and distinguished himself high honour. He greatly contributed to the victory gained by the French at Aboukir, and was dangerously wounded at the siege of Acre.

When Bonaparte determined upon leaving Egypt, Lannes was one of the generals chosen to accompany him to France [BONAPARTE, P. C.; KLEBER, P. C. S.], where he rendered him material assistance in the revolution of the 18th Brumaire (November 9th), 1799, and as a recompense for his services on that occasion he was named commander of the Consular guard. He was afterwards employed in the south of France, at the head of the ninth and tenth military divisions, to suppress the insurgent Jacobins. From thence he was recalled by the First Consul, in the year 1800, to join the expedition to Italy, and he shared the dangers and labours which attended his services on this occasion was so great, that some years afterwards, Montebello was the title chosen for the dukedom to which he was raised. After the battle of Marengo, in which he likewise greatly distinguished himself, he received a sabre of honour, and was selected to present to the government at Paris the standards that had been taken from the Austrians. In 1801 he was sent to Lisbon by the First Consul in the capacity of minister plenipotentiary of France, a character for which his previous habits especially fitted him. The blunt frankness of a soldier, joined to his natural impetuosity of disposition, but ill accords with the close reserve of conduct so essential in a diplomatist. This very defect however proved of advantage to the cause in which he fought, and bore a determined bearing obtained from the feebly government of Portugal every measure which Napoleon at that time required. Several characteristic traits of General Lannes’ behaviour at the moment of Ligny are to be found in the recently published Memoirs of the Duchess of Abrantes [Madame Junot], whose husband was sent to supersede him as ambassador.

On his return from Portugal in 1804, Napoleon, who was now at the height of his power, considered the撤出 of a subject and sent him towards Duke of Montebello. In the Austrian campaign of 1805 Lannes was appointed to the chief command of the left wing of the French army, and was present at the battle of Wagram, where he distinguished himself by the gallantry he displayed towards Duke of Montebello. In the great and decisive battle of Austerlitz, December 2nd, 1805, where he manifested his usual courage and gave proof of increased skill and judgment, he had two of his sides-devils cut off by a direct shot from the enemy’s balls. He was instantly followed by his men, whom
The gallant spectacle of their leader's courage had animated, and, by this daring and decisive measure, the breach was quickly passed, and the town was gained.

The last but not least noble exploit of this distinguished general was the defence of the valley of Eauling, in the sanguinary battle which has been named from it, and the grand attack on the Austrians, which, though unsuccessful in its result, was conducted by Lannes with great skill and success.

While the French were thus occupied, the Austrians directed their attention to the island of Lobou, their vaunted bands were attacked by fresh troops, which the Archduke Charles brought up in constant reinforcement from the main body of his army, and checked the advancing numbers of the Austrians. The French had reserved their fire till the enemy had approached within a few yards of them, and then commenced a most desperate struggle.

At that critical moment Lannes distributed amongst his horse, that he might be least exposed to the sweeping fire of the Austrian artillery, when he was struck by a cannon-ball, which carried away the whole of his right leg and the foot and ankle of the left. Napoleon was directing the position of some batteries, when he beheld the almost lifeless body of his heroic marshal borne off from the battle. The last scene in the life of Lannes has been very differently related, and some of the circumstances of the last moments have been exaggerated.

The description given of it by Alixson, which is chiefly derived from the accurate narratives of Poleit, Savary, and Thibault, is that which appears most consonant with truth. He was reproached with the shattered remains of his heroic companion, Lannes had still sufficient strength remaining to seize his hand, and, with a voice weakened by loss of blood, to bid him a last adieu. 'Live, my friend, as the saviour of the world, and bestow a few thoughts on one of your best friends, who is shortly to be no more.' Beside the litter of his early friend, of the sharer of his perils, and the partaker of his fortunes, knelt and wept the Emperor of Europe. "Lannes," exclaimed Napoleon, "do you remember me? is it the emperor, it is Bonaparte, it is your friend; you will surely yet be preserved to us." 'To live in order to serve you and my country is my wish," he replied, "but in an hour I shall be no more.' On no occasion had Napoleon evinced such deep emotion. Nothing, he observed to Massena, 'but so terrible a calamity could have withdrawn me for a moment from the care of the army.'

Critical indeed were the circumstances in which that army was then placed, and the fate of Napoleon's empire was depending on the issue; but seldom can ambition, even amid its highest efforts, stifle the genuine emotions of the heart. For some time Napoleon remained in the presence of the emperor, during which he was constantly visited by the emperor, and on the 31st of May, 1809, he expired. At the same time had fallen with him the brave General St. Hilaire, whom, like Bayonne, Napoleon had styled 'the knight without fear and without reproach.'

Lannes, unlike many of Napoleon's generals, had acquired a constantly increasing military reputation. In the first part of his career courage predominated over judgment; but experience was daily producing in his mind a more just equilibrium between those two qualities so essential to a commander. 'I found him a dwarf," said the emperor to Las Cases, "and I lost him a great.' And in another conversation with this faithful companion of his exile, he remarked of this marshal that 'he had great experience in war, having been in fifty-four battles and three hundred combats. He was cool in the midst of fire; possessed of a clear penetrating eye, ready to take advantage of any opportunity which might present itself. Violent and hasty in his temper, even in my presence, he was however ardently attached to me.' His chief fault was a carelessness of the future, too common among the soldiers of that period; a large shaver in the rewards which Napoleon so lavishly bestowed upon his generals, he was the prodigal of his means as of his blood. But to his credit it may be said that he never received a pension of his in coming, but went to the relief and support of his poorer companions in arms.

Lannes had married Madeleine Louise de Ghebhenacus, a young woman of exquisite beauty and possessing manners. When she became a widow, Napoleon evinced by the most assiduous attention to her the highest respect he bore for the memory of her distinguished husband. She was afterwards appointed a lady of honour to the Empress Maria Louise. The present Duke of Montebello, Lannes' eldest son, has married an English lady, Ellen, the daughter of Charles Jenkins, Esq.

The Military Life of Lannes, written by Mons. René Peria, was published at Paris, in 1810.

sulwar War.

LANTERN. [SKYLIGHT, P. C.] LANTERN, MAGIC. [MAGIC LANTERN, P. C. S.] LANZAROTE, one of the Canaries, lies about seventy miles from the mainland, and is about one hundred and sixty miles in circumference, between 28° 02' and 29° 14' N. lat., and 13° 50' and 14° 29' W. long. It is separated from the island of Fuerteventura, which lies south of it, by a strait which is from four to six miles wide, and called La Bocaya. Lanzarote extends in a north-east and south-west direction about thirty-one miles, with a breadth varying between five and ten miles. The area is estimated at 325 square miles, or about forty miles more than the county of Middlesex.

North of Lanzarote are five small islands: the largest are Algebranza and Graciosa, which are inhabited, and produce barley and orchids; the others are only rocks. The strait between them is so narrow that it is in most parts rather more than a mile wide, and is the most spacious and only safe port for large ships in the Canaries, but useless as a harbour for trade, because the coast of Lanzarote rises so steeply, until it reaches the height of 1500 feet. The mountain mass to which these cliffs belong contains an extinct volcano, called La Corona, whose edges rise to the elevation of 1506 feet above the sea. From this point the mountain mass gradually descends southward, and is surmounted by a few wide valleys which open to the south-west, and in which palm-trees and fig-trees abound. It terminates in an extensive sandy plain, which surrounds Teguise, the capital of the island. West of this place the country is covered by numerous hills surrounded by fields of lava. All these hills have a conical form, consist of scoria and ashes, and have craters. These hills were formed by a terrible eruption which took place in 1720. Such masses of lava were thrown out by them, that one-third of the island, and that the most fertile portion, was converted into a stony waste. The streams of lava ran into the sea, owing to which the whole western shore is precipitous in the island, which from one little bay called Janubio, where once a harbour for small vessels, which by the eruption was converted into a salt-water lake. The eastern shores are neither so steep nor so precipitous as the western, and, extending straight southward, called Montana Blanca, lies to the west of the lava tract, nearly in the centre of the island; it rises to 2000 feet above the sea, and is cultivated to the summit.

The climate of Lanzarote is exceedingly hot, but during certain seasons, when the south-east winds, having passed over the Sahara, extend to the island: these winds frequently bring hosts of locusts with them. In spring and the early part of the summer northern and north-eastern gales are frequent; they last for several days, and blow with such violence as to prevent the growth of trees, which are only found in the valleys of the northern tract, where they are protected by the high ground north of them. Rain is scarce, and the crops are uncertain. A drought which lasted from 1768 to 1771 compelled nearly the whole population to emigrate; the water in the cisterns had entirely dried up. There is only one spring on the island, and even that is inconsiderable.

Wheat, barley, Indian corn, and potatoes are extensively cultivated. In some parts are large vineyards; the grapes are of a superior flavour, and the wine of Lanzarote is preferred to that of the other islands. The most important product is the barilla, which is obtained from the Mesembryanthemum crystallinum: this plant is indigenous, but has also become the object of extensive cultivation. The South embryo is a delicate, white, hair-like plant. The fruits are small, but very small; they are only kept for agricultural labour. Very few horses and mules are kept; but there are many donkeys and camels. There are many goats and sheep. There are few hogs. On the plains, the so-called El Río salt is made, and a considerable quantity is exported to the other Canaries.

The population is estimated at about 18,000 individuals. They are strongly built, and of a dark complexion. May have
L A P

Black curly hair, and some features which prove that the ancient Spanish settlers have intermarried with the Moors and Negroes of Africa. The inhabitants are mostly occupied with cultivating the ground; but several families gain their livelihood by fishing. Three vessels on an average are annually sent to the coast of Africa, where the Assou-grogs, as the native canoes of Cape Bojador to Cape Blanco; each vessel makes between eight and nine voyages, and has a crew of from thirty to forty men. They take chiefly cod and Brent, and salt them. Salt-fish constitutes the principal food of the population.

The capital is Teguine, a small place consisting of about two hundred houses scattered over a small hill. On the eastern shore is the harbour, which has a number of foreign vessels visiting annually the island is stated to vary between twenty-five and thirty. Lanzarote exports to Teneriffe and Palma considerable quantities of grain, brandy for the West Indies, cattle for the slaughter, and quantities of green and dry timber and firewood, besides foreign articles. From the small port of Papagayo, near the southern extremity of the island, a large quantity of brandy is sent to Fuerteventura, whence it is consumed in the interior of the island.

Lanzarote was the first of the Canaries which submitted to the Spaniards. They took possession of it in 1404. In the sixteenth and seventeenth centuries it was frequently laid waste by the Moors from the coast of Africa. This circumstance, with the terrible eruption of 1780, and the great dearth in 1768 to 1771, prevented the inhabitants from improving their agricultural condition. But in the middle of the eighteenth century a gym of the barilla plant was introduced, and since that time the condition of the population has improved.

(Humboldt, Voyage aux Régions Equatoriales du Nouveau Continent; Von Buch, Physikalische Beschreibung der Canarischen Inseln; Arlett, Survey of some of the Canary Islands, &c., in London Geographical Journal, vol. vi.; Mac Gregor, Die Canarischen Inseln nach ihrem gegenwärtigen Zustande.)

LAPERO, ARNOLFO DI, the name by which a very celebrated and one of the most early of the Italian architects is known. He is said to have lived at the time of Leonum German, whose house in Lucca he decorated, and who was sometimes called in Florence Jacopo Todesco, but more frequently Lapo. This Lapo, who executed many works in Florence, died there, according to Vasari, in 1202.

L. minor has a tapering fleshly root, an erect stem, 3 feet or more in height, solid, leaffy, round, and with many wide-spreading branches. The leaves are stalked, broad, heart-shaped, and being 3-ribbed at the base, somewhat hirsute and downy beneath. The flowers are axillary, with their anthers and stigmas purple. When in flower the involucre readily breaks from the stalk, and is known in the country by the name of a fur. It approaches the cost of the hair and clothing of those who pass by, and it is almost impossible to become free from it without breaking the scales and scattering the fruit. The root is reckoned tonic, aperient, and diuretic. It has some power in the form of a decoction in rheumatism and rheumatism of the skin. Sir Robert Waldolph recommends it as a remedy in gout, and some have used it as an excellent substitute for scarapilla. The fruit is bitter and slightly acid, and has been prescribed as a diuretic. It grows in waste places throughout Europe and the West of Asia.

L. major and L. tomentosus are species which are found in Germany and Switzerland, but are not used in the arts or medicine.

(Lindley, Flora Medica; Koch, Synopsis Flora Germanica.)

LAPSANA, a genus of plants belonging to the natural order Composite, the sub-order Tubulifloro, tribe Scioneceae, and the sub-tribe Cardineae. It has an equal and many-flowered homogamous head, a globose involucre, with imbricated coriaceous scales. The receptacle is rather fleshy, flat, and with stiff fringes. The corollas are 5-lobed, regular, and with a 10-nerved tube. The stamens have papillate filaments, with anthers terminating in filiform appendages. The fruit is oblong, laterally compressed, smooth, and transversely wrinkled.

L. communis, Nipple-wort. It has dentate or lobed stalked leaves, the lower leaves tuncate; the involucres glabrous and angular; the stem panicked. The stem is from one to three feet in height, branching above, with many small-headed florets. It is found in waste uncultivated land, and derives its common name from its reputation in village medicine, as a soothing application to inflamed nipples, and is used in many of our provinces as an external application in wounds and ulcers.

L. fistula is a species of this genus, which grows in Switzerland and the regions of the Alps.

(Lindley, Flora Medica; Koch, Synopsis Flora Germanica.)

LAPSE. [Beveridge, P. C.]

LARDIZABAL, a genus of plants belonging to the natural order Magnoliaceae, recorded by the name of St. Paul after Michael Lardizabal, of Uruguay, a Spanish naturalist. It has discoid or polypodium flowers. The sepals and petals disposed in a ternary order in 2 or 3 series. The stamens of a monadelphous cym. The ovary is 3-locular, the fruit a 3-valved, 3-seeded. The pulp of the fruit sweet and edible. It has leaves 2-5 ternate; the leaflets oblong, acute, unequal at the base, a little toothed; two large unequal ciliate hairs situated at the base of the peduncle. The plant is not seen in Peru. About Arauco it has an edible fruit, which is gathered and eaten.
sold in the markets of Chili and Peru. The pulp of the fruit is sweet and grateful to the taste. It is called in Peru Aguil-bougal and Guibougal; and in Chili by that of Copo-

L. reticulata and L. trifoliata are climbing plants, native of Chili and Peru, but their fruits are not eaten.

(Latin Formulary Dictionary.)

LARREY, DOMINIQUE-JEAN, BARON, was born at Beaufoul, near Bagnères de Bigorre, in France, in July, 1786. He studied the elements of medicine and surgery at the hospi-

tale at Toulouse under the direction of his uncle Alexis Larrey, who practised medicine in that city. In 1797 he went to study his profession in Paris, and obtained the appointment of surgeon to the regiment of Vignolle, in which he served until 1813. He returned to Paris at the commencement of the Revolution, and in 1792 joined the French army which was then carrying on its operations in the Rhine. Here he disting-

Laserpitium (the name of the ancient Sphilmum), a genus of plants belonging to the natural order Umbelliferae. It has a calyx with a 5-toothed rim; the petals oblong, emarginate, with an indented lobe; the fruit comprising, from the back, or somewhat taper, 8-winged, that is, the half-fruits with five primary flibilem ribs, and four winged secondary ones; a vitta in the channel below each secondary rib. The petals, 2-3-pinnato leaves, and entire toothed or cut segments; marcescent and showy umbels; the involucres many-leaved; the flowers white, rarely yellow.

L. glabrum, glabrous Lasera, has bipinnate leaves, quite glabrous in every part; the leaflets obliquely cordate, here and there mucronate and toothed; leaves of the involucres setaceous; wings of the fruit equal, rather curved. This plant is a native of mountainous districts of Europe, dry and rocky places. It attains a height of one or two feet on the Alps, but in cultivation is a much larger plant. The root is filled with a gum-resin, which is acrid, bitter, and even some-

L. silus has bipinnate quite glabrous leaves; leaflets lanceo-

L. silus is supposed by Fras to be identical with the Arvensis of Dioscorides, 3, 51. Sibthorp found this plant he species of L. gregos, which is narrow, and is found in Spain, also yields a gum-resin. There are several other species of Laserpitium described, and many of them yield a gum-resin, which is one of the secretions of the order to which these plants belong.

(Lindley, Flora Medica; Don Gardener's Dictionary; Fras, Synopsis Plantarum Florae Classic.)

LASTÈRE, a genus of Ferns, belonging to the tribe Aspidiaceae. It has a reniform indusium attached by the sinus, the veins distinct after leaving the midrib, and not uniting with those of the adjoining pinnules.

The following species of this genus are described in Rabing-

L. Neopolliniana has a herbaceous scabrous erect stem, with roundish seven-nerved leaves, and seven blunted lobes; the pedicels axillary and aggregate, the involucres shorter than the calyx, the lobes of the calyx acuminate. The flowers are blue with obtuse petals. This species is a native of Italy, Spain, Portugal, the north of Africa, and the Canary Islands, on maritime rocks; also in Britain, in the Isle of Wight, on Portland Island, in Cornwall, and Devonshire. It is the Malacian of Thesmophra (Hist. Pl., 1; 5; i. 14).

L. Neopolliniana has an herbaceous scabrous erect stem, with roundish seven-nerved leaves, and seven blunted lobes; the pedicels axillary and aggregate, the involucres shorter than the calyx, the lobes of the calyx acuminate. The flowers are blue with obtuse petals. This species is a native of Naples, by the sea-side, and is much cultivated in our own gardens as an ornamental plant.

L. Otbis has a strigilated, and rarely scabrous, from distant fascicles of hairs; the leaves are soft, woolly, five-lobed, the upper ones three-lobed, with the middle lobe elongated; the uppermost leaves are oblong, almost undivided, the flowers solitary, not in an inflorescence. It is a native of Provence, in hedgerows about D'Ihivres.

None of the species of Lavatera are of any importance or
value, excepting as ornamental plants. Many of them are herbs, and the growth of a tresson has thus become a luxury of the rich.

The greenhouse and frame species will thrive well in a mixture of loam and peat, or any light soil; they may be planted out during the summer against a south wall, and if protected in the winter by a strong frame or by a piece of glass will thrive all the year.

The perennial species grow in a kind of soil, and may be propagated either by dividing the plants at the root or by seeds. The annual and biennial kinds should be sown in different frames and in a temperature of 50° by the end of January of the year. The species chiefly worth cultivation in gardens are L. Olba, Iinnz, unguiculata, Nepenthes, Oelsia, Australian, Astringica, and Trissmis.

(Don, Gardener's Dictionary; Babington, Manual Brit. Bot.)

LAW, CRIMINAL. The object of the English law as of every other system of Criminal Law is the prevention of injuries by the terror of punishment; but it is not every injury the commission of the which law thinks fit to prevent by such means; in most cases it is satisfied with the redress of injuries after they have been committed, either restoring the party injured to his right, where that is possible, or by giving him compensation in damages. In law, an injury is any violation of a legal right or omission of a legal duty; a crime, then, may be defined to be such a violation of a legal right or omission of a legal duty as subjects the person guilty of it to punishment. Such acts or omissions for which the law affords redress only have, in England, been usually denominated civil injuries as distinguished from crimes. It is to be observed, however, that, in strictness, every crime includes an injury, but not every injury is a crime. Crime, therefore, by the law, is properly defined to be actionable by the party injured, and he is entitled to redress. In felony, indeed, such injury is said to be merged in the crime; but this doctrine appears to have originated in the circumstances of all felonies having, with one or two exceptions, been originally punishable with death and having worked a forfeiture of all the offender's property, and so rendered redress impossible.

Crimes, according to the English law, are divisible into two classes, as depend upon the mode of proceeding peculiar to each, viz. into

1st. Such as are punishable on indictment or information (the common law methods of proceeding).

2nd. Such as are punishable on summary conviction before a justice or justices of the peace or other authorized persons, without the intervention of a jury (a mode of proceeding derived entirely from special statutory enactments).

It is proposed, in the first place, to treat of offences punishable on indictment or information, and afterwards to shortly refer to those punishable on summary conviction.

Offences punishable on Indictment or Information.

Indictable offences are distributable into four classes, viz.: tressons, praemunire, feloies, and misdemeanors. Persons who commit the offences which constitute the last-mentioned division may also be prosecuted by criminal information instead of being indicted.

The distinction between these classes is, for the most part, a merely formal difference, and is only intended to render more certain the rule which constitutes the consequence of the following upon the nature wholly indistinguishable are, in many instances, separated and subjected to punishments widely disproportionate, and to forms of procedure widely dissimilar. In fact, the only real distinguishing feature between one class of crimes and another, at the present day, is to be found in certain peculiarities of punishment and procedure incident to each. Formerly, however, the classes were marked by distinctive characteristics; but they have subsequently, either by artificial constructions of the courts or by legislative enactment, been made to embrace offences of a very different nature from any of the earlier classes, and within the last, the crime of treason, whether high or petit, implied a violation of the allegiance due from an inferior to a superior. In the ease of high treason, so called by way of eminence distinguished from petit treason, which may be subject to his liege lord and sovereign; and in case of petit treason, which was limited to the murder of a husband by his wife, a master by his servant, or an ecclesiastic by his inferior with whom he was in the pacque of the allegiance of private and domestic faith.

The characteristic above pointed out can no longer be traced in many of the various constructive treasons which have been from time to time enacted. It will be necessary, therefore, here to give a single illustration of the mode in which the law has treated this class of offences, and in particular with its original design. By one of the clauses of the statute of treasons (25 Edw. III. c. 2) it is declared to be treason to levy war against the king. A riotous assembly attempting by force to do so or to inspire others to do so would, for example, to pull down all inclosures or to burn all meeting-houses, has been held to be a levying of war within the meaning of this clause, although there has been no direct intention or design whatever against the person or the person of the king. This construction is said to depend upon the generality of the design. If the intention be to pull down particular inclosures or meeting-houses only, the offence is a mere riot, and in quality a simple misdemeanour, although the possibility of design may be a reason for awarding a higher punishment in the former than in the latter case, there appears to be no foundation in reason or principle for construing an offence, which but for such generality would be a misdemeanour only, to amount to the crime of treason in levying war against the king. The Criminal Law Commissioners (4th, 5th, and 6th Reports) have recommended that this offence should no longer be considered to fall within the statute of treasons. They propose that the only assemblings or risings of the people which should amount to a levying of war against the king should be such as are against the person of the king, or against any army or forces appertaining to him, by the 12th section of his authority, or with intent to do him bodily harm, or impose any restraint upon his person, or to deprive him, or to dispossess or deprive him of any portion of his dominions or regal authority, or in any manner to force him to change his measures or counsels, or to put any forces or constraint upon or to intimidate or outrage both houses or either house of parliament; and that no assemblage or rising of the people should by reason of any illegality or generality of purpose be deemed to be a levying of war against the king, unless it be with one or other of the several intentions before mentioned. Such riotous and tumultuous meetings as have no such intention in view they recommend to be classed as misdemeanours or misdemeanors merely, according to the circumstances by which they are attended.

Again, the term 'praemunire' was originally applied to offences which consisted in the introduction of any foreign jurisdiction, more especially the authority of the See of Rome, into the kingdom; but has subsequently, to use the language of Mr. Benjamin Hawkins ('Plea of the Crown, b. 1, c. 19'), been applied to other heinous crimes, for the most part having relation to the offences originally coming under the notion of praemunire, but in some instances none at all. The Halaeus Corpus Act (31 Car. II. c. 12) contains an instance of the latter mode of application. By the 2nd section of that act it is made a praemunire to send any inhabitant of England, Wales, or the town of Berwick-upon-Tweed, a prisoner beyond the seas in defiance of its provisions to the contrary.

The term 'praemunire' was adopted from the first word of the original writ on which the subsequent proceedings were founded: 'praemunire' means to intromit or to introduce, and is corrupted from corum nobis, &c. [PRAEMUNIRE, P. C.]. The Criminal Law Commissioners propose to abolish praemunire as a class of crimes. (Seventh Report.)

The crime of felony had its origin in very remote times, and was founded upon feudal principles. Its incidents were not former, as they are now, of a merely arbitrary nature, peremptorily annexed to certain criminal acts without reference to rule or principle. The crime originally consisted in a violation of the feudal contract by the misconduct of the lord or of the tenant; and when committed by the tenant, occasioned a consequence forfeiture of his hold to the lord, (see Black Comm., p. 96; 4th and 7th Reps of Crim. Law Commrs.)

Those crimes, therefore, which induced such forfeiture, and, by a small deflection from the original sense, those which induced the forfeiture with intent, were classed as felonies, and afterwards, by long use the term felony came to signify the actual crime itself, and not the penal consequence. 'So that, upon the whole,' to use the words of Mr. Justice Blackstone (4 Com. Dig., tit. felony, p. 206), 'the denomination of felony seems to be that which is before laid down, viz. an offence which occurs a total forfeiture of either lands or goods, or both, at the common law; and to which capital or other punishment may be suppressed and the person acquitted of guilt. Where the punishment is less than capital, the offender loses his goods only; where capital, his lands as
well as his goods. The crimes which occasioned such forfei-
ture were originally, with one or two exceptions, capital; but at the present day there are offenses for which no greater punishment can be inflicted than imprisonment for a term not exceed-
ing fourteen years, and in those cases which are for offenses and con-
sequences the forfeiture of all the offender's goods and chattels; whilst other crimes, for which the punishment may be as high
as transportation for fourteen years, and in four instances must
be for life, are misdemeanors only, and work no forfeiture.
It is apparent from this that the present law is very defective, and
that the amount of punishment is no longer the test of dis-
tinction between a felony and misdemeanor. It is proposed by
the Committee on Criminal Law (Sec. Rep. p. 19) to remedy this by making the liability to transportation the test of
distinction, i.e. that all offenses liable to a less punishment
than transportation should be misdemeanors only.

The term 'Misdemeanor' is used in the English system
of Criminal Law to denote such indicable offenses as are of
a lower degree than felony.

We shall now point out the peculiarities of punishment
which distinguish one class of crimes from another at the pre-
sent day. In order to this, the penal consequences incident
the whole body of offenses constituting each class will be
first stated, and then in what respects those consequences dif-
fers from brother class. The classes will be taken in the same
order as above.

1. Treason. — Treason, with one exception mentioned
below, are capitally punished; but whether capital or not, the offender,
upon conviction is sentenced to the crown and personal
captors for every description, whether in action or possession, or settled
by way of trust, which the offender has otherwise than as an
executory (Cr. Car. 366), or a trustee, or a mortgagee (3 & 4 Wm. IV. 
c. 23, s. 9) as the case may be. In the case of captns, upon attaint by judgment of
death or outlawry, the blood of the offender is corrupted, but
not so as to obstruct descent to such offender's posterity, where
the offense is not a capital one, or is derived through such offender
to a remote ancestor (3 & 4 Wm. IV. c. 106, s. 10), and all the
freehold lands and tenements of inheritance in free-simple or
fee-tail, and all other hereditaments (except copholds), whatever
they be granted, by way of fee or grant; and all the
right of entry on freehold lands and tenements which the offender
has (other than as a trustee or mortgagee, 4 & 5 Wm. IV. c. 23, s. 9) at the time of the offense com-
mitted or at any time afterwards, and also the profits of all
freehold lands and tenements which the offender has in his or
her own right for life, so long as such interest shall subsist,
and, if the offender be a male, his wife's dowry, are forfeited
so. to the crown (4 Black Comm., 281; 30 Hen. VIL, c. 13,
5; 33 Hen. VIII, c. 20, s. 2; and 35 & 36 Edw. VI c. 11,
s. 9 and 13); and all the cophold estates belonging to the
offender at the time of the offense committed are forfeited to the
said crown (5 & 6 Judg. C. 1, s. 3). The above penal consequences are general to all capital
tresonors, unless, as is sometimes the case, the act which creates
the particular treason expressly exempts from some of them. The
latter is the case of a capital treason committed by the party guilty
of it to those only of the above consequences which accu-
rm upon conviction, since the others follow only upon the
party's being attained, that is, sentenced to death or out-
lawed, which latter, in the case of capital treasons and felonies,
is of the same effect as being sentenced to death. The
existence of this non-capital treason would appear to be the
result of inaccuracy. By the Forcroy Consolidation Act
(11 Geo. IV. & 1 Wm. IV. c. 81) it was declared to be
treson and punishable with death to forge the great and other
royal seals and the sign manual. By the 2 & 3 Wm. IV. 
c. 23, the punishments of death was repealed for forgery in all but the two cases of wills and powers of attorney to trans-
fer stock (it has been since taken away in those cases also by
the 7 Wm. IV. & 1 Vict. c. 84); but the quality of the
offenses enumerated in the Forcroy Consolidation Act was left
without alteration: so that to forge the royal seals, for
which appearance would appear to be still treason, though no longer a capital
offense.

The judgment of death in the case of treason is that the
offender, if a male, be drawn on a hurdle to the place of
execution, and be there hanged by the neck until dead; and
that afterwards the head be severed from the body of such of-

fender, and his body divided in four quarters, to be dis-
posed of as her Majesty shall think fit (4 Black Comm.,
p. 1499); and, if a female, that the offender be drawn to the place
of execution and be there hanged by the neck until dead
(30 Geo. III. c. 48, s. 1). The queen, however, may, by
warrant under her sign manual, countermanded by a principal
secretary of state, direct, where the offender is a male, that
he shall not be drawn, but taken in such manner as in the
word, or sent to the place of execution, and he shall not be hanged, but be beheld, whilst alive, instead
(54 Geo. III. c. 146, s. 2).

2. Precumaries. — The penalties of preumaries, as shown
summed up by Sir Edward Coke (1 Inst. 190 a), are, 'that
from the conviction the defendant shall be out of the king's
protection, and his lands and tenements (i.e. in fee-simple or
for life, but not in tail beyond his life interest therein),
and goods and chattels, are forfeited;' and that his body shall
remain in prison at the king's pleasure, or, as other au-
thorities have it, during life. These penalties were first im-
posed by the stat. 16 Rich. II, c. 5 (commonly called the
Statute of P r e u m a r i e s ); and it is by reference to that statute
that all subsequent preumaries have been made punishable.
It was formerly supposed that a person convicted of preumary,
being put to death under the king's protection, might be
killed with impunity, as being the king's enemy; but by the 5 Eliz. c.
ss. 21 and 22, it was enacted that it should not be lawful to
kill any person attainted in a preumary, saving such parts of
death or other hurt or punishment as theretofore might, with
put to death, be done upon us, and save our man and
to the realm, &c. any process, &c. from the See of Rome.
Preumaries, although they occasion a forfeiture of the
offender's lands and goods, are not felonies. To constitute a
forfeiture of moveables, the offense must be of a higher law;
but in case of preumary the forfeiture is made as a
part of the punishment by statute merely, which is not suf-
cient (4 Black Comm., pp. 94 and 118.)

3. Felonies. — The felonies, with one or two exceptions,
were originally, with one or two exceptions, punishable with death; but the
offender, unless the felony was excluded from the benefit of
clergy, was entitled, for a first offender, to be discharged from the
capital punishment upon paying a fine in the discretion of
that person (13 & 14 Geo. I. c. 82, s. 3). But now, since the passing of the 7 & 8 Geo. IV. c. 28,
it is not punishable with death unless it was excluded from the
benefit of clergy before or on the 14 Nov. 1828, or has been
punished or imprisoned for the same offense; all others being
tied to the realm, &c. any process, &c. from the See of Rome.
Any sentence of death in a capital offense is suspended for
seven years, or imprisonment for any term not exceeding
two years, with the addition, if the court shall think it, of whipping, where the offender is a male, hard
labour and solitary confinement, or any of them. (7 & 8 Geo. IV. c. 28, ss. 7 and 8.) Such confinement must not
however be for a longer period than one month at a time, or
three months in a year. (7 Wm. IV. & 1 Vict. c. 90, s. 5.)

In the case of conspiracy, under the Statute of Treason (7 
Wm. IV. c. 23, s. 3), at the time of conviction (Bac. Abrid.,
"Forfeiture" (I) ; Co-Litt. 391 a); and in the case of all
capital felonies, upon attaint by judgment of death or
forfeiture, forfeits to the crown the profits of all estates of

capital felonies (4 Black Comm., 355), and of things not lying in
tenure (Bac. Abrid., "Forfeiture" (A)), and to the lord of the
manor the profits if all estates of any cophold (Hawk.
P.C. b. 2, c. 49, s. 7; Lord Campbell's case, 2 Vett.
38-9), which the offender has, otherwise than as a trustee or
mortgagee (4 & 5 Will. IV. c. 23, s. 3), at the time of the
offense committed, during his life; and his blood is corrupted
(but not so as to obstruct descent to the posterity of such
offender where they are obliged to derive a title through him
to a remote ancestor (3 & 4 Will. IV. c. 106, s. 10), and
after his death his copholds which he holds in fee-simple are
forfeited to the lord (Coke on Copholds, 523, note d.) And also in the case of murder, all his
freehold lands and tenements in fee-simple escheat (subject to
what is called the crown's day, day and waste) to the lord of the
lost (7 Geo. III. c. 146; Co-Litt. 391 a; 4 Black Comm.
355.)

The judgment of death in the case of all capital felonies, except murder, is that the offender be hanged by the
neck until dead; and, if a male, drawn on a hurdle to
the place of execution, and be there hanged by the neck until
death, and, if a female, that the offender be drawn to the
place of execution and be there hanged by the neck until
death (4 Black Comm., 355).
have been confined after conviction. (2 & 3 Will. IV. c. 75, s. 18; & 4 & 5 Will. IV. c. 95.) The court however is empowered, if it shall think that the offender is a fit subject to be recommended to the royal mercy, to abstain from pronouncing judgment of death upon him, and to order such judgment to be entered of record instead; and the judgment so ordered has the same effects as the conviction which produced the punishment were reprimed. (4 Geo. IV. c. 48, ss. 1 & 2; & 6 & 7 Will. IV. c. 90, s. 2.)

4. Misdemeanors.—The punishment in the case of misdemeanors is, more immediately, decided by the court, and not by a statute, that has been specially provided by statute, is generally fine and imprisonment.

From what has been stated, it will be seen that the circumstances of the offense are the determining circumstances of the sentence—distinguishing misdemeanors from all other classes of offenses, is the absence of forfeiture as a necessary consequence of conviction. The distinction between misdemeanors and felonies (which term, it should be remarked, in its largest sense, includes treasons, on account of the forfeiture which that class of crimes occasions) is, that the forfeiture which ensues upon a conviction of the former is, as before observed, in pursuance of statutory provisions; whereas in the latter case it is a common law consequence of the offense, and follows as a matter of course whenever a crime is declared to be a felony. There appears to be no distinction as regards punishment, in the case of a no less a crime, than an act not only small in amount, but even a single act, as theft or false imprisonment of a person committed on the highway.

The law of felony is a great code, and the difference between felonies and treasons is not one which is readily distinguished. The court, in determining the degree of such offenses as false imprisonment, on account of, and upon, upon, forfeits to the crown the profits of such freehold and copyhold lands as he had at the time of committing the offense, during his life, and after his death, his copyholds in fee-simple are forfeited to the lord of the manor, and even when attainted of murder, though his freehold estates in fee-simple fall after his death, it is not as a consequence of the law of forfeiture, but because they escheat for want of heirs capable of enjoyment, as his blood being corrupted by the attainer; and it is on account of such estates escheatting and not being forfeited that they go to the lord of the fee (that is, subject to the crown's year, day and waste), and not to the crown, unless there appears to be no intermediate lord between the offender and the crown, in which event the crown takes as ultimate lord of the fee. In the case of treason, however, the offender upon attainer, instead of forfeiting to the crown the profits merely of such freehold lands as he had at the time of committing the offense, during his life, forfeits all freehold estates of inheritance, as well those in fee-tail as those in fee-simple, and not only such as he had at the time of the commission of the offense, but those also which he may acquire at any time afterwards; and instead of forfeiting to the crown the profits of his copyhold during his life, and to the lord of the manor his copyhold in fee-simple for the life of the copyholder, and instead of paying to the crown the profits of the manor all the copyholds belonging to him at the time the offense was committed. Where the offender is a male, his wife's dowry is also forfeited to the crown, which is not the case in the case of a female. The law of treason has now empowered (see 59 Geo. III. c. 94) to restore the whole or any part of any lands or hereditaments to which it becomes entitled by escheat or forfeiture to the family of the offender, a provision which has greatly mitigated the harshness of the law of forfeiture. The Criminal Law Commissioners however recommend the entire abolition of the confiscation of property as a necessary incident to convictions for treason or felony. (Seventh Report on Criminal Law.) The difference between the judgment of death for treason and that for felony requires no comment.

As to the peculiarities of punishment, those different classes of offenses are distinguished by particular forms of procedure; but it will be more convenient to refer to these when describing our general system of criminal procedure.

The law of England, in grouping under one or the other of the various classes into which indictable crimes are divisible by the law of England, it is now proposed to state shortly what are the different offenses comprised under each of those classes. In this belonging to each of those classes, and who are under their several punishments. The classes are taken in the same order as before. It will be proper, however, in the first instance, to show what persons are capable of committing crimes, to notice one or two provisions of general application, for the purpose of preventing repetition, and to make a few explanatory observations.

According to the law of England, all persons above the age of seven years, except such as by reason of unripeness, weakness, insensibility, disease or delusion of mind, are incapable of discerning, at the time they do an act, that the act is contrary either to the law of God or the law of the land, are criminally responsible for such act; but temporary incapacity willfully induced by intoxication or other means to excuse. An infant of the age of seven and under fourteen years, however, is to be presumed to be incapable of committing a crime until the contrary be proved. Duress, also, inducing a well-grounded fear of injury or death, will excuse a person acting under such stresses in all cases except treason and murder; and a married woman committing any offense, except those last mentioned, if her husband be present at the time, shall be presumed to have acted under his coercion, and be entitled to an acquittal, unless it appear that she did not so act. A married woman also shall not be liable to conviction for receiving her husband or any other person in his presence and by his authority.

The following provisions are of general application. By the statute 7 Will. IV. & 1 Vict. c. 90, s. 5, it is enacted that no court shall direct any sentence of imprisonment for a term of six months or more, in any case of confinement for any longer period than one month at a time or three months in the space of one year. Whenever, therefore, in the following statement solitary confinement is mentioned as part of the sentence of punishment for any offense, the periods during which it may be inflicted are to be understood as regulated by the above provision.

By the statute 7 Will. IV. & 1 Vict. c. 85, s. 11, power is given to the jury on the trial of any person for any felony whatsoever, where the crime charged shall include an assault against the person, to acquit the felony, and to find a verdict of guilty of assault against the person indicted, if the evidence shall warrants such finding; and thereafter the court may imprison the person so found guilty of an assault for any term not exceeding three years, with or without hard labour or solitary confinement, or with both.

By the statute 1 Geo. IV. c. 57, s. 3, it is provided that where the punishment of whipping on female offenders formed, before the passing of that act, the whole or part of the sentence to be pronounced, the court may pass sentence of confinement to hard labour for any time not exceeding six months nor less than one month, or of solitary confinement, in lieu of the sentence of being whipped. In all cases, therefore, where whipping is mentioned to be part of the punishment, with its being restricted to males, the above provision operates.

By the statute 3 & 4 Vict. c. 111, made perpetual by 5 & 6 Vict. c. 65, members of joint-stock or other banking companies, who, consisting of more than six persons, are charged with, or with intent to injure or defraud such co-partnerships, are made liable to the same punishments as if they had not been or were not members of such co-partnerships.

In the case of assault, a sentence of transportation only is given of any particular offence. It is to be observed, however, that where a crime is defined by statute, the enactment in most cases comprehe, in fact, many other offenses distinct from the general one, though in nature connected with it. For the details of such enactments, reference must be made to the statutes cited at the end of each offense. With respect to these statutes, those which define the crime, as well as those which declare the punishment, are referred to where ever the statutes are distinct, and these are arranged as regards any particular crime in the order of date; and generally, where there is no intent on the part of the criminal to injure any act of, or in the course of, such acts have been primarily separately from the public general acts.

I. TREASON.—(Capital.)

The following treasons are punishable with death; viz.:—1. Compassing or abetting the death of the king, or of a queen regnant, or of his queen, or of their eldest son and heir;
violating the king's companion, (4. e. his wife during the coverture,) or the king's eldest daughter unmarried, or the wife of the king's eldest son and heir; levying war against the king in his realm, or being adherent to the king's enemies in his realm, giving them aid and comfort in the realm or elsewhere, and being thereof attainted of open deed; or slaying the chancellor, treasurer, or the king's justices of the one bench or the other; justices in eyre or justices of assize, or any other justices assigned to hear and determine, being absent in their places doing their offices. (25 Edw. III. st. 5. c. 2.)

2. Endeavouring to prevent the person next in succession to the crown, according to the Acts of Settlement, from succeeding thereto, (1 Anne. st. 3. c. 17. s. 3.)

3. Affirming, by writing or printing, that any other person has a right to the crown otherwise than according to the Acts of Settlement and the Acts for the Union of England and Scotland; or that the crown, with the authority of parliament, is unable to limit the descent of the crown. (6 Anne. c. 7. s. 1.)

4. Compeising or intending the death or destruction, or any bodily harm tending to death or destruction, or any wounding, imprisonment or restraint of the person of the king; or to deprive or depose him from the crown; or to levy war against him, within the realm, in order to compel him to change his measures or counsels, or in order to overthrow the parliament; or to move any foreigner to invade any of the British dominions; such compising or intention being expressed by publishing some printing or writing, or by some overt and visible act. (2 Geo. III. c. 7. s. 1. made perpetual by 57 Geo. III. c. 6.)

5. Being married to, or being concerned in procuring the marriage of any issue of her present majesty whilst such issue are under age, or in the crown or have descended to any such before that age), without the consent in writing of the regent and the assent of both Houses of Parliament. (5 & 4 Vict. c. 52. s. 4.)

6. Giving any person to have committed any of the before-mentioned capital treasons, receiving, relieving, comforting or assisting him, or aiding his escape from custody.

7. Bringing into the realm papal bulls or other writings or instruments from the See of Rome; or publishing or writing or in use any such bulls, writings or instruments. (18 Eliz. c. 2. s. 2 and 3.)

Besides the last-mentioned offence, there also existed till very recently several other capital treasons relating to the See of Rome; but these were repealed by the 7 & 8 Vict. c. 102.

Traiter.—(Non-Capital.)

The following treason (the one already alluded to) is punishable with transportation for life or not less than seven years, or with whipping for any term not exceeding one year, or with or without hard labour or solitary confinement, or with both; viz—

1. Forgery of the great seal, her majesty's privy seal, any privy seal of the realm, the royal sign manual, the seals appointed to be used in Scotland, and the great and privy seals of Ireland. (11 Geo. IV. & 1 Wm. IV. c. 66. s. 2; 2 & 3 Wm. IV. c. 123; 3 & 4 Wm. IV. c. 44. s. 3; 7 Wm. IV. & 1 Vict. c. 84. ss. 2 and 3.)

11. Premises.

The following are the offences coming under this denomination still in force:

1. Derogating from the queen's courts. (27 Edw. III. st. 1. c. 1. s. 1.)

2. Deeds and charters omitting to elect a bishop; and archbishops or bishops to consecrate the person so elected after receiving the queen's congé d'élire. (25 Hen. VIII. c. 20. s. 7; repealed by 1 & 2 Philip and Mary, c. 8, and revised by 3 & 4 Phi. c. 5.)

3. Molossing the possessors of abbey lands contrary to the provisions of 1 & 2 Philip and Mary, c. 8. (1 & 2 Phi. and Mary, c. 8. s. 40.)

4. Obtaining any stay of proceedings, other than by arrest of judgment or writ of quo warranto, in mulct or monopo. (21 Jac. I. c. 8. s. 4.)

* By the 11 Hen. VII. c. 1, it is enacted that no person who attends upon the king or queen, or attends upon the queen for the true being, in his person, and does him true and faithful service of allegiance in all things belongeth to his person or his estates, in this land or without, shall for such deed and true allegiance be convicted or attainted of treason.

* The repeal of this offence is recommended by the Commissioners for revising the Criminal Law, in Their Report on Peace, War, and Disabilities in regard to Religious Opinions, dated the 20th May, 1848.

5. Procuring any stay of proceedings, other than by the authority of the court, in actions brought against persons for making provision or purveyance for the crown. (12 Car. III. c. 24, s. 14.)

6. Assembling maliciously and advisedly, by speaking or writing, that both Houses or either House of Parliament has a legislative authority without the crown. (18 Car. II. c. 1, s. 3.)

7. Sending any subject of the realm a prisoner beyond the seas in defiance of the Habeas Corpus Act. (31 Car. II. c. 9. s. 12.)

8. Asserting, maliciously and directly, by preaching, teaching or maintaining, that any act according to the Acts of Settlement and Union, has any right to the throne of these kingdoms, or that the queen and parliament cannot make laws to limit the descent of the crown. (6 Anne. c. 7. s. 2.)

9. Knowingly and wilfully solemnizing, assisting or being present at, any marriage forbidden by the Royal Marriage Act. (12 Geo. III. c. 11. s. 3.)

10. Aiding, comforting or maintaining persons who bring into the realm papal bulls or other writings or instruments from the See of Rome, to the intent to uphold the jurisdiction or authority of the pope. (13 Eliz. c. 2. s. 4.)

III. Felonies.—(Capital.)

The following felonies are punishable with death, viz—

1. Destroying ships of war or her majesty's arsenals, dockyards, magazines, storehouses or victualling, or other ammunition of war, &c. (12 Geo. III. c. 24. s. 1.)

2. Murder. (9 Geo. IV. c. 81. s. 3.)

3. Unnatural offences. (9 Geo. IV. c. 81. s. 15.)

4. Aiding, or procuring the taking of a person, by ouing or by wounding, or by any other means whereby bodily injury dangerous to life is caused. (7 Wm. IV. & 1 Vict. c. 85. s. 2.)

5. Burnary, aggravated by striking an inmate. (7 Wm. IV. & 1 Vict. c. 85. s. 2.)

6. Robbery, aggravated by wounding the person robbed. (7 Wm. IV. & 1 Vict. c. 87. s. 2.)

7. Piracy, aggravated by endangering the life of any person on board. (16 Geo. IV. c. 80. s. 3.)

8. Setting fire to a dwelling-house, any person being therein. (7 Wm. IV. & 1 Vict. c. 89. s. 2.)

9. Destroying vessels with intent to murder, or whereby human life is endangered. (7 Wm. IV. & 1 Vict. c. 89. s. 4.)

10. Exhibiting false lights, &c. with intent to bring ships into danger, or unlawfully doing anything tending to the destruction of ships in distress. (7 Wm. IV. & 1 Vict. c. 89. s. 5.)

Besides the above offences, that of wilfully and without lawful cause having or being possessed of any forged stamp used in pursuance of any Act relating to any duties on gold or silver plate made or wrought in Great Britain, for the purpose of marking or stamping such plate, appears to be still punishable with death.

That offence is contained in 56 Geo. III. c. 185. s. 7, by virtue of which enactment it was formerly also a capital crime to forge or utter the stamps provided for marking any such plate, or to fraudulently remove such stamps from one piece of such plate to another, or privately or secretly to use such stamps with intent to defraud the king. The punishment of death for these last-mentioned offences was repealed, however, by 11 Geo. IV. & 1 Wm. IV. c. 66. s. 1 (as to the forging and uttering), and by 4 & 5 Vict. c. 56. s. 1 (as to the removing and fraudulently using); but by some inaccuracy (for it is clear that it can never have been intended) the offence of being possessed, without lawful excuse, of forged stamps for marking gold or silver plate (the least criminal of all the acts specified in 56 Geo. III. c. 185. s. 7) is still left capital.

There are two other enactments of capital offence which do not seem to have been wholly repealed, either expressly or by implication. The Criminal Law Commissioners (7th Report) say, 'Although many Acts have been passed which punish prison-brush by penalties not capital, yet these seem to be still sufficiently severe to render particular grises and prisons, and not to
affect the general enactments above referred to, as regards officers against their provisions confined in other prisons.  

(Non-Capital.)  

Non-capital felonies are punishable as follows, viz., with  
1. Transportation for life, and previously thereto imprisonments, &c., with or without hard labour, for any term not exceeding four years.  
2. Offenders transported from Great Britain being found at large, without some lawful excuse, before the expiration of their term of transportation. (5 Geo. IV. c. 84, s. 92; 4 & 5 Wm. IV. c. 67.)  

II. Transportation for life.  
1. Rape. (9 Geo. IV. c. 31, s. 16; 4 & 5 Vict. c. 56, s. 5.)  
2. Carnally knowing and abusing girls under ten years of age. (9 Geo. IV. c. 31, s. 17; 4 & 5 Vict. c. 56, s. 8.)  
3. Forgery of the name or handwriting of the Receiver-General of Prisons, or of the Comptroller-General of Customs, &c., to any draft, &c., on the Bank. (8 & 9 Vict. c. 85, s. 36.)  

III. Transportation for life, or not less than fifteen years, or imprisonment for any term not exceeding three years, with or without hard labour or solitary confinement, or with both.  
1. Piracy. (28 Hen. VIII. c. 15; 11 & 12 Wm. III. c. 3, s. 8, 9, and 10; 4 Geo. I. c. 11, s. 7; 6 Geo. I. c. 19; 8 Geo. I. c. 34; 12 Geo. III. c. 56, s. 7; 18 Geo. I. c. 25; 7 Wm. IV. & 1 Vict. c. 61, s. 3.)  
2. Offences against the Riot Act.* (1 Geo. I. s. 2, c. 5, ss. 1 and 5; 7 Wm. IV. & 1 Vict. c. 91, ss. 1 and 2.)  
3. Rescuing a runner out of prison, or whilst going to or during transportation. (25 Geo. II. c. 87, ss. 9, 10; 7 Wm. IV. & 1 Vict. c. 91, ss. 1 and 2.)  
4. Seducing sailors or soldiers from their allegiance, or inducing them to desert. (57 Geo. III. c. 70, s. 1; 57 Geo. III. c. 7; 7 Wm. IV. & 1 Vict. c. 61, ss. 1 and 2.)  
5. Administering oaths binding any person to commit treason or any capital felony. (32 Geo. III. c. 104, s. 1; 7 Wm. IV. & 1 Vict. c. 91, ss. 1 and 2.)  
6. Any subject of her majesty, or any person residing in any of the queen's dominions, or in any place under the government of the East India Company, or upon the high seas, or within the Admiralty jurisdiction, carrying away any persons to make slaves of them. (5 Geo. IV. c. 112, s. 9; 3 & 4 Wm. IV. c. 73; 7 Wm. IV. & 1 Vict. c. 91, ss. 1 and 2.)  
7. Assembling armed, to the number of three or more, for the purposes of smuggling. (7 Wm. IV. & 1 Vict. c. 91, ss. 1 and 2; 8 & 9 Vict. c. 87, s. 63.)  
8. Shooting at vessels belonging to the navy or in the revenue officers, &c., employed in the prevention of smuggling. (7 Wm. IV. & 1 Vict. c. 91, ss. 1 and 2; 8 & 9 Vict. c. 87, s. 64.)  
9. Attempts to aid or abet, by attempting to administer poison, or by shooting at or attempting to drown, suffocate, or strangle any person, although no bodily injury be effected. (7 Wm. IV. & 1 Vict. c. 85, ss. 3 and 5.)  
10. Attempting to discharge any kind of loaded arms at or wounding any person, with intent to do grievous bodily harm to such person, or to prevent lawful apprehension or detention. (7 Wm. IV. & 1 Vict. c. 85, ss. 4 and 8.)  
11. Sending explosive substances, &c., to any person, or throwing any corrosive fluid or other destructive matter upon any person, with intent to do grievous bodily harm, and whereby grievous bodily harm is done to any person. (7 Wm. IV. & 1 Vict. c. 85, ss. 5 and 9.)  
12. Attempting to procure the miscarriage of women. (7 Wm. IV. & 1 Vict. c. 85, ss. 6 and 8.)  
13. Robbery, aggravated by the offender being armed, by numbers, or by the use of personal violence to the person robbed. (7 Wm. IV. & 1 Vict. c. 87, ss. 3 and 10.)  
14. Extorting property by threatening to accuse of unnatural generation, &c., with intent to extort any money. (7 Wm. IV. & 1 Vict. c. 87, ss. 4 and 10.)  
15. Setting fire to places of worship or houses, or to buildings or erections used for the purposes of trade, with intent to injure or defraud any person. (7 Wm. IV. & 1 Vict. c. 89, ss. 1 and 2.)  
16. Setting fire to or otherwise destroying vessels, with intent to prejudice any person interested therein or in the goods on board the same, as an owner, part owner or underwriter. (7 Wm. IV. & 1 Vict. c. 89, ss. 6 and 12.)  
17. Forcibly recovering a person, &c., in order to save his life from a vessel in distress or wrecked. (7 Wm. IV. & 1 Vict. c. 89, ss. 7 and 12.)  
18. Setting fire to coal-mines. (7 Wm. IV. & 1 Vict. c. 89, ss. 9 and 12.)  
19. Setting fire to stacks of corn, grain, coal or wood, &c., or to any stook of wool. (7 Wm. IV. & 1 Vict. c. 89, ss. 10 and 12.)  
20. Transportation for life, or not less than fifteen years, or imprisonment for any term not exceeding three years.  
1. Setting fire to farm buildings, or to buildings or erections used in farming land; or for the purpose of setting fire to such farm-buildings, or to any fire to farm produce or implements being therein, with intent in any such case to injure or defraud any person.* (7 & 8 Vict. c. 62, ss. 1 and 2.)  
2. Forgery of the name or handwriting of any person so entitled, or of any officer or servant of Chelsea Hospital, &c., or any writing concerning the payment of any such prize-money, &c. (2 Wm. IV. c. 53, s. 49.)  
3. Transportation for life or for any term of years.  
1. Taking or attempting to take (being compelled thereto) binding the person taking the same to commit treason or any capital felony. (93 Geo. III. 104, s. 4.)  
2. Personating soldiers or other persons entitled to pensions, &c., on account of military services, or their representatives; or  
3. Forgery of the name or handwriting of any person so entitled, or of any officer or servant of Chelsea Hospital, &c., or any writing concerning the payment of any such pensions, &c. (7 Geo. IV. c. 16, s. 38.)  

VIII. Transportation for life or for fourteen or seven years.  
1. Aiding the escape of prisoners of war from prison or from the queen's dominions, if at large upon parole. (52 Geo. III. c. 156, s. 1.)  
2. Subjects of her majesty sitting, upon the high seas, the escape of prisoners of war after they have quitted the coast. (52 Geo. III. c. 156, s. 8.)  

IX. Transportation for life or not less than seven years, or imprisonment for any term not exceeding seven years, with or without hard labour or solitary confinement.  
1. Stealing or embezzling her majesty's ammunition, naval or military stores. (4 Geo. IV. c. 55; 7 & 8 Geo. IV. c. 27.)  
2. Sending letters threatening to kill any person, or to burn his house, &c.; or rescuing a person in custody for any such offence. (4 Geo. IV. c. 54, s. 3; 7 & 8 Geo. IV. c. 27.)  
3. Bankrupt not surrendering, or not discovering all his estate, or embezzling or concealing any part thereof to the amount of 10l. or upwards, &c. (5 & 6 Vict. c. 122, ss. 32 and 33.)  
4. Transportation for life or not less than seven years, or imprisonment for any term not exceeding four nor less than two years, with or without hard labour or solitary confinement, or with both.  
1. Forgery of the seal or bonds of the South Sea Company (6 Geo. I. c. 4, s. 56; 11 Geo. IV. & 1 Wm. IV. c. 66, ss. 1 and 26); of receipts or warrants of the South Sea Company (6 Geo. I. c. 11, s. 50; 11 Geo. IV. & 1 Wm. IV. c. 66, s. 4; 2 & 3 Wm. IV. c. 129; 3 & 4 Wm. IV. c. 64, s. 3; 7 Wm. IV. & 1 Vict. c. 84, ss. 2 and 3); of seals, policies, &c., of the London and Royal Exchange Assurance Companies (6 Geo. I. c. 18, s. 15; 11 Geo. IV. & 1 Wm. IV. c. 66, ss. 1 and 4; 4 & 5 Wm. IV. c. 122, s. 1); of the seal of the Commissioner of the Accountant-General, Registrar, or Clerk of the Report Office (of the Court of Chancery), or of any cashier of the Bank, to any instrument relating to the sailors' money or
bank-notes, bills of exchange, promissory notes and warrants, or orders for the payment of money (11 Geo. IV. & 1 Wm. IV. c. 66, s. 3; 2 & 3 Wm. IV. c. 123, s. 1; 3 & 4 Wm. IV. c. 44, s. 3; & 5 & 6 Wm. IV. c. 44, s. 3, 7 & 8 Wm. IV. c. 123, s. 2; & 1 Vict. c. 84, s. 2 and 3); of deeds, bonds, court-rolls, receipts for money or goods, or accountable receipts, or orders for the delivery of goods (11 Geo. IV. & 1 Wm. IV. c. 66, s. 9); of entries in registers of marriages hereafter or herebefore to be kept by the officiating minister of the parish, &c.; or of marriage licences (11 Geo. IV. & 1 Wm. IV. c. 66, s. 20 in part; 6 & 7 Wm. IV. c. 80, ss. 43 and 49); of wills and other testamentary writings, and of powers of attorney to transfer any public stock transferable at the Banks of England or Ireland or the South-Sea Bank, or to receive any dividend in respect of any such stock (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 3 and 6; & 3 Wm. IV. c. 123, s. 2; 7 Wm. IV. & 1 Vict. c. 84, ss. 1 and 3); of certificates, &c. of the commissioners for granting relief to the Irish Guiltain, Loop, and the island of Dominica (2 & 3 Wm. IV. c. 125, s. 65; & 6 & 7 Wm. IV. c. 51; 7 Wm. IV. & 1 Vict. c. 84, s. 1 and 3); of receipts or certificates of the Slave-Compensation Commissioners (5 & 6 Wm. IV. c. 45, s. 12); of receipts or certificates for the sum of four millions for funding Exchequer-bills (2 & 3 Vict. c. 97, s. 32).

2. Offending a third time in uttering counterfeit gold or silver coin not permitted to be current within this realm. (37 Geo. III. c. 126, s. 4; 11 Geo. IV. & 1 Wm. IV. c. 66, ss. 1 and 26.)

3. Denying a seaman or mariner, or other persons entitled to any allowance from the Compagnonate Fund of the navy, in order to receive their pay or prize-money, or allowance from the Compagnonate Fund. (11 Geo. IV. & 1 Wm. IV. c. 20, s. 9; 1 Vict. c. 84, ss. 1 and 26.)

4. Taking false oath in order to obtain probate of the will or administration of the effects of deceased seamen or mariners, or demanding their pay or prize-money by virtue of such will or administration, &c. (11 Geo. IV. & 1 Wm. IV. c. 20, ss. 88 and 89.)

5. Making false entries in the books of the Bank, or of the South Sea Company, or making transfers of stock transferable at either of those places, in the names of persons not being the true owners thereof. (11 Geo. IV. & 1 Wm. IV. c. 66, s. 5; 2 & 3 Wm. IV. c. 123, s. 1; 3 & 4 Wm. IV. c. 44, s. 3; 7 Wm. IV. & 1 Vict. c. 84, ss. 2 and 3.)

6. Partaking of any stock or of the capital stock of the Bank of England, or of the South Sea Company, or of the capital stock of any corporate body, &c. established by charter or act of parliament, or of any dividend payable in respect of such stock, and thereby transferring or endeavouring to transfer the same to any other person, in order to receive such dividend. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 16, 17, 18, and 19; 2 & 3 Wm. IV. c. 123, s. 1; 3 & 4 Wm. IV. c. 44, s. 3; 7 Wm. IV. & 1 Vict. c. 84, ss. 2 and 3.)

7. Acknowledging any recognition or bail, cognizant action, judgment, or deed to be enrolled, in the name of any person not privy thereto. (11 Geo. IV. & 1 Wm. IV. c. 66, s. 11.)

8. Destroying or injuring registers of marriages heretofore kept, or registers of baptisms or burials heretofore or hereafter to be kept by the officiating minister of the parish, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, s. 20 in part; 6 & 7 Wm. IV. c. 86, ss. 43 and 49.)

9. Officers of the Bank or South Sea Company secret- ing, embellishing, or running away with securities or effects. (15 Geo. IV. c. 10, s. 15; 24 Geo. IV. c. 11, s. 15; 18 Geo. IV. c. 66, s. 6; 37 Geo. IV. c. 46, s. 8, & 5 Vict. c. 66, s. 1.)

provisions, powers, privileges, advantages, penalties, forfeitures, and disabilities, above mentioned, still remaining, are to be considered as a body of laws of the same name, in the manner of the statue of grants on Bank, parchment, or paper. See Lord Advocate's "Statute Criminal Law," p. 61, note (c); the language of the Act has been reproduced on a large scale, with the exception of the

* As to the forgery of stamps on newspapers, the 6 & 7 Wm. IV. c. 76, s. 1, appears to make it an offence punishable under 10 Geo. IV. c. 114, s. 3, & c. 12 Geo. IV. c. 50, s. 2. Also, as to certificates relating to the duties of excise, see 41 Geo. III. (U. K.), c. 3.

** The 52 Geo. III. c. 142, s. 10, appears to be repealed, so far as relates to the Customs and Excise, for by 17 Geo. IV. c. 54, s. 3, &c. 38 Geo. IV. c. 18, and 47 & 48 Wm. IV. c. 44, &c. 6 & 7 Wm. IV. c. 44, s. 7, &c. 7 Wm. IV. & 1 Vict. c. 84, ss. 3 and 9, of stamps upon relating to the duties of the Excise (5 Geo. IV. c. 25, s. 15; 11 Geo. IV. & 1 Wm. IV. c. 66, ss. 1 and 26); of certificates, &c. as to donations granted by the commissioners for the reduction of the national debt, or of instruments made by them relating thereto (10 Geo. IV. c. 54, s. 41; 11 Geo. IV. & 1 Wm. IV. c. 66, ss. 1 and 26; 2 & 3 Wm. IV. c. 59, s. 19; 7 Wm. IV. & 1 Vict. c. 84, ss. 1 and 3); of certificates and other documents in order to obtain pay or prize-money, drawn in respect of services performed by any person in the navy (11 Geo. IV. & 1 Wm. IV. c. 120, ss. 83 and 88; 2 Wm. IV. c. 40, s. 35); of Exchequer-bills, &c. Exchequer debentures, East-India bonds.
10. Privately or secretly using stamps provided in pursuance of any Stamp Act, with intent to defraud her Majesty of any duties granted by such act. (22 Geo III. c. 184, s. 7; 55 Geo III. c. 185, s. 7; 9 Geo IV. c. 18, s. 35; & 5 & 6 Geo V. c. 65, s. 1 & 4.)

11. Fraudulently tearing off or removing stamps from vellum, parchment, paper, gold or silver plate, &c., with intent to use them again. (55 Geo III. c. 184, s. 7; c. 185, s. 7 & 4.)

12. Offenders transported from St. Helena coming into England before the expiration of their term of transportation. (6 Geo IV. c. 65, s. 18; 4 & 5 Vic. c. 56, ss. 1 and 4.)

13. Library of a stamp office; or stamp works; or buildings connected with trade or the business of mines. (7 & 8 Geo IV. c. 8, s. 8; 4 & 5 Vic. c. 56, ss. 1 and 4; & 6 & 7 Vic. c. 10.)

14. Transportation for life or not less than seven years, or imprisonment for any term not exceeding four nor less than two years.

1. Being possessed, without lawful excuse, of forged dies, &c., or of any vellum, parchment, or paper having thereon the impression of any forged die, &c., or fraudulently using any stamp which shall have been removed from any other vellum, &c.; or getting out of or from any vellum, &c., any matter therein expressed, with intent to use the stamp then being thereon, for any instrument or thing liable to stamp duty, &c. (3 & 4 & 5 Wm IV. c. 97, ss. 11 and 12; 4 & 5 Wm IV. c. 60.)

2. Forgery of any of the stamps; or privately or fraudulently using such stamps, or, without lawful excuse, being possessed of any paper or other material so privately or fraudulently stamped. (3 & 4 & 5 Vic. c. 96, s. 32.)

3. Destroying or damaging goods of silk, woolen, linen, or cotton, &c., whilst in progress of manufacture, or any machine or implement used therein, or forcibly entering any place to commit any of those offences. (7 & 8 Geo IV. c. 30, ss. 3 and 27.)

4. Breaking down sea-banks, &c., whereby any land shall be in danger of being overflowed or damaged; or destroying works on navigable rivers or canals. (7 & 8 Geo IV. c. 98, ss. 12 and 27.)

5. Destroying, &c., public bridges. (7 & 8 Geo IV. c. 98, ss. 13 and 27.)

6. Transportation for life or not less than seven years, or imprisonment not exceeding four years, with or without hard labour or solitary confinement, or with both.  

1. Counterfeiting the queen's current gold or silver coin. (2 Wm IV. c. 84, ss. 3 and 19.)

2. Gilding or silvering or colouring counterfeit coin, or any pieces of metal, with intent to make them pass for the queen's current gold or silver coin; or colouring or altering genuine coin, with intent to make it pass for a higher coin. (2 Wm IV. c. 84, ss. 3 and 19.)

3. Buying, &c., or putting off, &c., at a lower value than the same by its denomination imports, or importing into the kingdom or exporting out of the kingdom any coin intended to pass for the queen's current gold or silver coin, knowing the same to be counterfeit. (2 Wm IV. c. 84, ss. 3 and 19.)

4. Having been convicted of uttering counterfeit coin intended to pass for the queen's current gold or silver coin, &c., or having been convicted of uttering such coin, and being possessed at the time of such uttering of more such coin, or having, on the same day or within ten days afterwards, uttered more such coin, &c., afflicting any of such offences. (2 Wm IV. c. 84, ss. 3 and 19.)

5. Having been convicted of having in possession three or more pieces of counterfeit coin intended to pass for the queen's current gold or silver coin, with intent to utter the same, &c., afterwards committing the like offence. (2 Wm IV. c. 94, ss. 18 in part and 19.)

6. Without lawful authority, making, buying or selling, or having in possession, &c., any instrument adapted for counterfeiting the queen's current gold or silver coin. (2 Wm IV. c. 94, ss. 10 and 19.)

7. Without lawful authority, conveying out of the Mint instruments of coining, or any coin, bullion, &c. (2 Wm IV. c. 94, ss. 11 and 19.)

8. Persons employed under the Post Office stamping, embossing, secretarial or other business connected with the Mint or coining, &c. (7 Wm IV. & 1 Vic. c. 36, ss. 26, 41, 42.)

9. Stealing money, &c., out of post letters. (7 Wm IV. & 1 Vic. c. 36, ss. 27, 41, 42.)

10. Stealing post letter-bags, or post letters from post office-bags or from post-offices, or from the officers of the post-office, or from mail-boxes; or stopping mails with intent to rob or search them. (7 Wm IV. & 1 Vic. c. 36, ss. 28, 41, 42.)

11. Receiving letters or other property the stealing, &c., whereof is felony under the Post-office Acts, knowing the same to have been stolen, &c. (7 Wm IV. & 1 Vic. c. 36, ss. 30, 41, 42.)

12. Forgery of the name or handwriting of the Receiver-General of the General Post-office, &c. to any draft &c. on the Bank. (7 Wm IV. & 1 Vic. c. 36, ss. 33, 41, 42.)

13. Transportation for life or not less than seven years, or imprisonment for any term not exceeding four years, with or without hard labour.  

1. Taking away or detaining, from motives of lucre, a heir, &c., against her will, with intent to marry or defile her, &c. (9 Geo IV. c. 94, ss. 10, 11.)

14. Transportation for life or not less than seven years, or imprisonment for any term not exceeding four years, with or without hard labour; or such fine as the court shall award. (9 Geo IV. c. 94, ss. 9, 9.)

15. Transportation for life or not less than seven years, or imprisonment for any term not exceeding four years.  

1. Persons employed in the Public Record Office certifying &c. true false copies of records in the custody of the Master of the Rolls. (2 & 3 Vic. c. 94, ss. 19 in part.)

2. Forgery of the signature of any Assistant Record Keeper, for the purpose of counterfeiting a certified copy of a record, &c., or the seal of the Public Record Office. (3 & 4 Wm IV. c. 94, ss. 19 in part.)

16. Transportation for life or not less than seven years, or imprisonment for any term not exceeding four years.  

1. Stealing in a dwelling-house to the value of 5d. or more. (7 & 8 Geo IV. c. 29, ss. 12; & 3 & 4 Wm IV. c. 62; 3 & 4 Wm IV. c. 44, ss. 4; & 7 Wm IV. & 1 Vic. c. 90, ss. 1 and 3.)

2. Breaking, entering, and stealing in a dwelling-house to any value. (7 & 8 Geo IV. c. 29, ss. 12; & 3 & 4 Wm IV. c. 62; 3 & 4 Wm IV. c. 44, ss. 4; & 7 Wm IV. & 1 Vic. c. 90, ss. 1 and 3.)

3. Entering and stealing in a dwelling-house to the value of 5d. or more. (7 & 8 Geo IV. c. 29, ss. 12; 3 & 4 Wm IV. c. 44, ss. 4; & 7 Wm IV. & 1 Vic. c. 90, ss. 1 and 3.)

4. Breaking, entering and stealing in buildings within the curtilage of a dwelling-house, but having no communication with the dwelling-house, either immediate or by means of a covered and inclosed passage leading from the one to the other. (7 & 8 Geo IV. c. 29, ss. 13 and 14; 7 Wm IV. & 1 Vic. c. 90, ss. 2 and 3.)

5. Breaking, entering and stealing in shops, warehouses or counting-houses. (7 & 8 Geo IV. c. 29, ss. 15; 7 Wm IV. & 1 Vic. c. 90, ss. 2 and 3.)

* See below, the punishment for a first offence.

† For the purpose of this and the next offence no building, although within the curtilage of a dwelling-house, shall be deemed to be a dwelling-house, which would not be deemed to be so for the purpose of burglary, that is, no building between the dwelling-house and the curtilage, or communication, either immediate or by means of a covered and inclosed passage leading from the one to the other. See the 7 & 8 Geo IV. c. 29, ss. 12.
6. Stealing to the value of 10s. goods of silk, woollen, linen or cotton cloth, lying in any place during any stage of manufacture. (7 & 8 Geo. IV. c. 29, s. 16; 7 Wm. IV. & 1 Vict. c. 90, ss. 2 and 3.)

7. Stealing goods, from vessels, &c. in ports or upon navigable waters, or on board ships or vessels, or on the quay or wharf adjacent thereto. (7 & 8 Geo. IV. c. 29, s. 17; 7 Wm. IV. & 1 Vict. c. 90, ss. 2 and 3.)

8. Maliciously killing, maiming or wounding cattle. (7 & 8 Geo. IV. c. 30, s. 16; 7 Wm. IV. & 1 Vict. c. 90, ss. 2 and 3.)

9. Maliciously destroying hop-bounds growing on poles in hop plantations. (7 & 8 Geo. IV. c. 30, s. 18; 7 Wm. IV. & 1 Vict. c. 90, s. 5.)

10. Stealing in a dwelling-house, &c. by threats or menace putting any inmate in bodily fear. (7 Wm. IV. & 1 Vict. c. 86, ss. 5 and 7.)

11. Robbery or stealing from the person. (7 Wm. IV. & 1 Vict. c. 87, ss. 5 and 10.)

12. Plundering vessels in distress, or wrecked, stranded, or cast on shore, or anything belonging to such vessel. (7 Wm. IV. & 1 Vict. c. 89, ss. 8 and 12.)

13. Maliciously destroying any part of a vessel in distress, or wrecked, stranded or cast on shore, or anything belonging to such vessel. (7 Wm. IV. & 1 Vict. c. 89, ss. 9 and 10.)

XX. Transportation for fourteen years.

1. Solomnising marriage at any other time than that prescribed by law, or without banns, unless by licence or under the provisions of the 5 & 8 Wm. IV. c. 85 (which allows marriages to be solemnised before the Registrar of the district), or pretending to be in holy orders and solemnising marriage according to the rites of the Church of England. (4 Geo. IV. c. 76, s. 21.)

2. Being possessed &c. without lawful excuse, of forged bank-notes, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 12 and 28.)

3. Without the authority of the Bank, making or being possessed of instruments for making, &c. paper used by the Bank for bank-notes, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, s. 13.)

4. Without the authority of the Bank, engraving, making or being possessed of instruments for making, &c. bank-notes, &c., or any character or ornament resembling any part of a bank-note, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 15 and 16.)

XX. Transportation for any term not exceeding fourteen years.

1. Aiding prisoners to escape, or in attempting to escape from prison, whether an actual escape be made or not. (4 Geo. IV. c. 64, s. 43.)

2. Rescuing offenders sentenced to be transported or banished. (5 Geo. IV. c. 84, s. 22.)

3. Forgery certificates given under the Income Tax Act. (5 & 6 Vict. c. 181, continued in force by 9 Vic. c. 4.)

XXI. Transportation for any term not exceeding fourteen nor less than seven years, or imprisonment not exceeding three years, nor less than one year, with or without hard labour, or solon rectorate or of such punishment, the

4. Without authority, making or being possessed of instruments for forging, &c. paper used by any other bank than the Bank of England. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 17 and 26.)

5. Without authority, engraving, making or being possessed of instruments for making, &c. foreign bills, &c. of any other bank than the Bank of England. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 18 and 26.)

6. Without authority, making or being possessed of instruments for making, &c. foreign bills, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 19 and 26.)

XXII. Transportation for any term not exceeding fourteen nor less than seven years, or imprisonment not exceeding three years, nor less than one year, with or without hard labour or solon rectorate or of such punishment, the

1. Subscribing false petitions to the Secretary of the Admiralty, or personating the representatives of deceased seamen or marines, in order to procure a certificate from the Inspector of Royal Marines, &c., thereby to obtain, without probate or letters of administration, any allowance from the Commissariat Fund of the Navy, &c. (11 Geo. IV. & 1 Wm. IV. c. 20, ss. 87 in part and 88.)

2. Submitting false petitions to the Secretary of the Admiralty, or personating the representatives of deceased seamen or marines, in order to procure a certificate from the Inspector of Royal Marines, &c., thereby to obtain, without probate or letters of administration, any allowance from the Commissariat Fund of the Navy, &c. (11 Geo. IV. & 1 Wm. IV. c. 20, ss. 87 in part and 88.)

XXII. Transportation for any term not exceeding fourteen nor less than seven years, or imprisonment not exceeding five nor less than three years, with hard labour.

1. Trading in slaves either directly or indirectly, or entering into contracts in connexion therewith; or forging certificates of valuation, sentences or decrees of condemnation or restitution, &c. (5 Geo. IV. c. 113, s. 10; 3 & 4 Wm. IV. c. 73.)

XXIV. Transportation for any term not exceeding fourteen nor less than seven years, or imprisonment not exceeding five nor less than three years, with hard labour.

1. Tracing in slaves either directly or indirectly, or entering into contracts in connexion therewith; or forging certificates of valuation, sentences or decrees of condemnation or restitution, &c. (5 Geo. IV. c. 113, s. 10; 3 & 4 Wm. IV. c. 73.)

XXXIII. Transportation for any term not exceeding fourteen nor less than seven years, or imprisonment not exceeding three years, with or without hard labour or solon rectorate or of such punishment, the

2. Embezzlement by clerks or servants. (7 & 8 Geo. IV. c. 29, ss. 4 and 46.)

3. Robbery of the property, the stealing or taking whereof is felony, knowing the same to have been stolen, &c. (7 & 8 Geo. IV. c. 29, ss. 4 and 44.)

4. Booting and others concealing, &c. and not reporting according to the law, or obliterating the marks, &c. on, anchors or other articles found by them on the coast, &c. (provided the stealing of such articles on shore would amount to felony). (1 & 2 Geo. IV. c. 75, ss. 1; and c. 76.)

5. Obtaining in any manner, &c. without lawful excuse, of forged bank-notes, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 15 and 16.)

6. Without the authority of the Bank, engraving, making or being possessed of instruments for making, &c. bank-notes, &c., or any character or ornament resembling any part of a bank-note, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, ss. 15 and 16.)

7. Without the authority of the Bank, making or being possessed of instruments for making, &c. paper used by the Bank for bank-notes, &c. (11 Geo. IV. & 1 Wm. IV. c. 66, s. 13.)

8. Forgery, &c. of assay marks on gold or silver wares; or fraudulently using genuine dies provided for marking such wares. (7 & 8 Vic. c. 22, s. 2.)

9. Swearing false oaths, &c. in any contract or conveyance or other public documents, for the purpose of deceiving her Majesty's property in such cases. (9 & 10 Wm. III. c. 41; 39 & 40 Geo. III. c. 89, ss. 4 and 7; 54 Geo. III. c. 60; 55 Geo. III. c. 127; 56 Geo. III. c. 188.)

* See 7 & 8 Geo. IV. c. 99, s. 13, referred to in note* p. 160; it is doubtful if the indulgence of the term "solemnising marriage" can "apply to the above offence; though in all probability it would be held to do so, the offender being convicted of the one (see 7 & 8 Geo. IV. c. 99, s. 13) in which that definition was intended to apply.

* See 7 & 8 Geo. IV. c. 99, s. 13, referred to in note* p. 160; it is doubtful if the indulgence of the term "solemnising marriage" can "apply to the above offence; though in all probability it would be held to do so, the offender being convicted of the one (see 7 & 8 Geo. IV. c. 99, s. 13) in which that definition was intended to apply.

* See 7 & 8 Geo. IV. c. 99, s. 13, referred to in note* p. 160; it is doubtful if the indulgence of the term "solemnising marriage" can "apply to the above offence; though in all probability it would be held to do so, the offender being convicted of the one (see 7 & 8 Geo. IV. c. 99, s. 13) in which that definition was intended to apply.
LAW

LAW

XXIX. Transportation for seven years.

1. Obstructing the execution of process, &c., within the hamlet of Wapping, Stepney, or any other place within the limits of the weekly bills of mortality, wherein persons shall unlawfully assemble and associate for the sheltering themselves from the bills of mortality which have been made by a presentment of the grand jury at a general or quarter sessions of the proper county. (11 Geo. I. c. 22, ss. 1 and 2.)

2. Aiding the escape from officers of justice of prisoners in their custody for the purpose of being carried to gaol by virtue of a warrant of commitment for treason or felony, or the escape of prisoners from their way for transportation. (16 Geo. II. c. 31, s. 3.)

3. Riotously assembling, to the number of five or more, to rescue offenders against the Acts relating tospirituous liquors; or assaulting persons who have given, &c., evidence, &c., against such offenders, &c. (24 Geo. II. c. 28, s. 28.)

4. Prisoners for debt not delivering in under the Lords' Act a true account of all their estate and effects, &c. (52 Geo. III. c. 59, s. 17; 33 Geo. III. c. 5; 39 Geo. III. c. 50.)

5. Damaging, &c., buoys, &c., fixed to the anchors or moorings of vessels in the Thames, with intent to steal the same. (36 Geo. III. c. 9, ss. 2 and 6.)

6. Being convicted a second time of unlawfully stopping or attempting to stop, or of otherwise preventing the conveyance of grain to or from any city, market-town or place of public supply. (11 Geo. II. c. 22; 36 Geo. III. c. 9, ss. 2 and 6.)

7. With intent to prevent the removal of grain, pulling down or otherwise destroying granaries, &c. (36 Geo. III. c. 9, ss. 2 and 6.)

8. Forfeiture of the declarations of the return of premiums on policies or contracts of insurance. (54 Geo. III. c. 133, s. 10; 54 Geo. III. c. 134, s. 11.)

9. Forcibly removing officers for goods seized under 6 Geo. IV. c. 80 (for repealing the duties on spirits distilled in England, &c.), or otherwise forcibly opposing the execution of the powers of that Act. (6 Geo. IV. c. 80, s. 143.)

10. Being found in company with more than four persons with smuggled goods, or in company with only one person within five miles of the coast, &c., with such goods, and armed or disguised. (9 & 10 Vict. c. 87, s. 65.)

11. Forfeiture of the superscription of a post letter with intent to avoid the payment of postage. (7 WM. IV. and 1 Vict. c. 36, s. 34.)

XXX. Transportation for any term not exceeding seven years.

1. Forgery of the seal, &c., of the British Society for extending the Fisheries and improving the Sea Coasts of the Kingdom. (1 Geo. IV. c. 93.)

2. Administering oaths intended to bind the person taking the same to engage in any seditious purpose, &c., or to be of any association or conspiracy formed for any such purpose, &c. (38 Geo. III. c. 102, ss. 11 and 12.)

3. Counterfeiting foreign gold or silver coin, not permitted to be current within the realm. (37 Geo. III. c. 126, s. 1.)

4. Bringing any such coin into the realm with intent to utter the same. (37 Geo. III. c. 126, s. 3.)

5. Boatmen, &c., conveying anchors, &c., which they know to have been swept for or otherwise taken possession of without being reported according to law, to any foreign port, &c., and there disposing of the same. (1 & 2 Geo. IV. c. 75, s. 15.)

XLI. Transportation for seven years, or imprisonment for any period not less than two years.

1. Without lawful excuse, making or being possessed of any instrument for making the paper used for permits by the Commissioners of Excise, or being possessed of any such paper, or engraving, &c., any plate, &c., for making or printing the paper used for permits, &c. (2 WM. IV. c. 16, s. 3.)

2. Without lawful excuse, making or being possessed of instruments for making the paper to be used for postage covers, or being possessed of any such paper, or by any means imitating or causing to appear in any manner, any such paper, &c., to be used in postage covers. (5 & 6 Vict. c. 29, s. 29.)

XXXII. Transportation for seven years, or imprisonment not exceeding four years.

1. Forgery of certificates or bills of exchange mentioned in 2 & 3 WM. IV. c. 106 (An Act for enabling Officers, &c., in the Army to draw for their Half-pay and Allowances). (2 & 3 WM. IV. c. 106, ss. 9 and 10.)

XXXIII. Transportation for seven years, or imprisonment for any term not exceeding three years nor less than one year, with hard labour.

1. Forgery of the seals, stamps or signatures of such certificates, official or public documents, proceedings of corporations, or joint stock or other companies, or certified copies of such documents or proceedings, as are receivable in evidence in Parliament or in any judicial proceeding, or tendering to evidence such certificates, &c., with false or counterfeit seals &c., thereto; or

2. Forgery of the signature of any equity or common law judge of the Supreme Court of Judicature (2 & 3 WM. IV. c. 167) of the judicial or official document, or tendering in evidence any such document with a false, &c., signature of any such judge thereto; or

3. Printing copies of private acts or of the journals of either House of Parliament, which copies, or any part thereof, are not to have been printed by the printers to the Crown or either House of Parliament, or tendering in evidence any such copy, knowing that the same was not printed by the persons by whom it so had to be printed. (9 & 10 Vict. c. 113, ss. 8 and 9.)

XXXIV. Transportation for seven years, or imprisonment for any term not exceeding three years, with or without hard labour or solitary confinement, or with both.

1. Persons employed under the Post-office stealing, embezelling, secreting or destroying post-letters. (7 WM. IV. and 1 Vict. c. 36, s. 16 and 17.)

XXXV. Transportation for seven years, or imprisonment for any term not exceeding two years nor less than one year, with or without hard labour or solitary confinement, or with both.

1. Forgery of the name or handwriting of witnesses attesting the execution of powers of attorney to transfer any public stock transferable at the Bank or South Sea House, or any capital stock of any body corporate, &c., established by charter or act of parliament, or to receive any dividend in respect thereof (11 Geo. IV. & 1 WM. IV. c. 66, ss. 8 and 26); or copies of registers of baptisms, marriages, &c., or burials, directed by law to be transmitted to the registrar of the diocese in which the church is held or in which the making false entries in such copies, &c. (11 Geo. IV. & 1 WM. IV. c. 66, ss. 22 and 26.)

2. Clerks, &c., of the Bank or South Sea House, with intent to defraud any person of any money, making false entries, or false or greater or less amount than the persons on whose behalf they are made out are entitled to. (11 Geo. IV. & 1 WM. IV. c. 66, ss. 9 and 26.)

XXXVI. Transportation for seven years, or imprisonment for any term not exceeding two years, with or without hard labour or solitary confinement, or with both; and the offender, if a male, may be once, twice, or thrice publicly or privately whipped, in addition to such imprisonment.

1. Forgery of the stamps or seals on hides or skins (9 Ann. c. 11; 10 Ann. c. 99; 5 Geo. I. c. 2, s. 9; 52 Geo. III. c. 145, s. 1; 78 Geo. III. c. 28, ss. 8 and 9; 11 Geo. IV. c. 133, s. 1; 7 & 8 Geo. IV. c. 28, s. 9; and 9; 1 WM. IV. c. 17, s. 1); of the name or handwriting of the registrar of the Court of Admiralty or High Court of Appeals of Fries, &c., to any instrument relating to the money or effects of the suitors of those courts (53 Geo. III. c. 151, s. 12; 7 & 8 Geo. IV. c. 28, s. 9;)

* As regards copies of registers of marriages, it would appear that this offence was abolished by 24 Geo. IV. c. 18, now the penalties for the same in such cases are such as attach to acts of fraud in the same manner as in the case of forgery. (1 WM. IV. c. 29, s. 3.)

† As regards registers of baptisms and marriages, in England, he committed with respect to such copies only as were transmitted before that Act came into operation and the Act does not apply to such cases. (5 & 6 Vict. c. 29, s. 5.)

2. There are still some cases in which this enactment is applicable.
Geo. IV. c. 29, s. 8 and 9); of quarantine certificates (6 Geo. IV. c. 78, s. 25; 7 & 8 Geo. IV. c. 28, s. 8 and 9); of the same or handwriting of her Majesty's Commissioners of Works, for workmen and Building boards, to any draft, &c. for money in the Bank, &c. on account of such commissioners, &c. (7 & 8 Geo. IV. c. 28, s. 8 and 9; 10 Geo. IV. c. 50, s. 194; 2 & 3 Wm. IV. c. 1, s. 1); or of the defendant in recovering the recovery of clearing and damage in personal actions (7 & 8 Geo. IV. c. 28, s. 8 and 9; 7 & 8 Vict. c. 19, s. 5 in part).

2. Obstructing the execution of process, &c. within Suffolke Place, or any part of St. George's, in the county of Surrey. (9 Geo. I. c. 28, ss. 1 and 2; 7 & 8 Geo. IV. c. 28, ss. 8 and 9.)

3. Persons having preserved merchandise, &c. belonging to vessels wrecked &c. within the jurisdiction of the Cinque Ports, selling or otherwise making away with the same, or in any manner altering the same with intent to prevent the discovery or identity thereof by the owners. (1 & 2 Geo. IV. c. 76, s. 8; 7 & 8 Geo. IV. c. 28, ss. 8 and 9.)

4. Quarantine officers deserting from their duty or permitting persons &c. to depart from lazaretts, &c., unless by permission under an order in council, &c.; or giving false certificates of vessels having duly performed quarantine. (6 Geo. IV. c. 78, s. 21; 7 & 8 Geo. IV. c. 28, ss. 8 and 9.)

5. Solemnizing marriages (except in the case of Quakers or Jews, or by special licence) in any other place than a church, chapel, or registered office, &c. so in any such office in the absence of the registrar of the district, &c. (7 & 8 Geo. IV. c. 28, s. 8 and 9; 6 & 7 Wm. IV. c. 85, s. 20.)

6. Superintendent registrars issuing certificates for marriage, or registering marriages, contrary to law; or registrars or superintendent registrars issuing licences for marriage, or solemnising marriages, contrary to law. (7 & 8 Geo. IV. c. 28, s. 8; 7 & 8 Wm. IV. c. 85, s. 40; 7 Wm. IV. & 1 Vict. c. 22, s. 3.)

7. Destroying, counterfeiting or inserting false entries in the register-books directed to be acted for by the register, deans, and registrars in England; or forging the seal of the register-office. (7 & 8 Geo. IV. c. 28, s. 8 and 9; 7 & 8 Wm. IV. c. 86, s. 43.)

8. Officer of the court uttering false certificates of indictments and convictions of a previous felony; or any other person signing &c., such certificates as such officer &c. (7 & 8 Geo. IV. c. 28, s. 9 and 11.)

9. Simple larceny. (7 & 8 Geo. IV. c. 29, s. 3 and 4.)

10. Deer-stealing, &c., where the deer are kept in enclosed lands. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 26.)

11. Deer-stealing, &c., where the deer are kept in unenclosed lands (for a second offence*); or offending a second time &c. in any other office belonging to parts for which a pecuniary penalty only is imposed, whether such second offence be of the same description as the first or not. (7 & 8 Geo. IV. c. 29, ss. 4, 5, and 26.)

12. Deer-stealing, &c., besetting other deer-keepers. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29.)

13. Stealing oysters &c. from oyster-beds &c. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 36.)

14. Stealing or severing with intent to steal, ore, coal &c. from mines &c. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 37.)

15. Stealing or damaging with intent to steal, or maliciously destroying &c. trees &c. growing in parks &c. or grounds belonging to dwelling-houses, if the value of the article stolen or the amount of injury done exceeds £1, or growing elsewhere, if such value or amount exceeds £5. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 38; and c. 30, ss. 19 and 27.)

16. Stealing, or damaging with intent to steal, or maliciously destroying &c. trees &c., wherever growing, if the value of the article stolen or the amount of injury done exceeds £1, or growing elsewhere, if such value or amount exceeds £5. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 38; and c. 30, ss. 19 and 27.)

17. Stealing, or damaging with intent to steal, or maliciously destroying &c. trees &c., wherever growing, if the value of the article stolen or the amount of injury done exceeds £1, or growing elsewhere, if such value or amount exceeds £5. (7 & 8 Geo. IV. c. 29, ss. 3, 4, and 38; and c. 30, ss. 19 and 27.)

* The first offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 4, 19, &c.)

** The second offence is punishable on summary conviction only, by fine not exceeding £10/10. (See 7 & 8 Geo. IV. c. 29, ss. 4, 19, &c.)

† The third offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

‡ The fourth offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

§ The fifth offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

¶ The sixth offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

** The seventh offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

† The eighth offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

‡ The ninth offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)

§ The tenth offence is punishable on summary conviction only, by fine not exceeding £10/10., or by imprisonment for any term not exceeding three months, and by attachment to the place of the leaflets &c. or the nature thereof. (See 7 & 8 Geo. IV. c. 29, ss. 3, 4, and 29; and c. 30, ss. 19 and 27.)
of debts or damages in personal actions, without lawful autho-
rities. (7 & 8 Geo. IV. c. 28, ss. 8 and 9; 7 & 8 Vic. c. 19, s.
5 in part.)

35. Workmen in mines in Cornwall removing or concealing ore with intent to defraud the proprietors of such mines. (2 & 3 Geo. IV. c. 10.)

XXXVII. Transportation for seven years, or imprisonment for any term not exceeding two years, with or without hard labour; and the offender, if a male, may be once, twice, or thrice publicly or privately whipped, in addition to such imprisonment.

1. Child-stealing. (9 Geo. IV. c. 31, s. 21.)

XXXVIII. Transportation for seven years, or imprisonment for any term not exceeding two years, with or without hard labour.

1. Bigamy. (9 Geo. IV. c. 31, s. 22.)

XXXIX. Transportation for any term not exceeding seven years, or imprisonment for any number of years.

1. Cutting away or in any way injuring or concealing buoys, &c. belonging to vessels or attached to the anchors or cables of vessels, whether in distress or otherwise.† (1 & 2 Geo. IV. c. 75, s. 11.)

XL. Transportation for any term not exceeding seven years, or imprisonment not exceeding two years, with or without hard labour or solitary confinement, or with both.

1. Counterfeiting the queen's current copper coin; or, without lawful authority, making or being possessed of instruments for counterfeiting such coin; or buying or selling such coin at a lower price than its valuation by its denomination imports. (2 Wm. IV. c. 34, ss. 12 and 15.)

XLI. Transportation for any term not exceeding seven years, or fine, imprisonment, and such corporal punishment in public or private whipping, as the court shall direct.

1. Slaughtering or flaying horses or other cattle without taking out the licence and giving the notice required by the Act for regulating slaughtering-houses, or doing so at any other time than within the house limits by the Act, or on or delaying to do so, when prohibited by the inspector. (20 Geo. III. c. 71, s. 8.)

IV. MISDEMEANORS.

Misdemeanors are punishable as follows: viz.:

1. Transportation for life.

2. Being at large within the United Kingdom after being sentenced to be banished under the provisions of the Roman Catholic Relief Act (10 Geo. IV. c. 47), without some lawful excuse, after three calendar months from such sentence. (10 Geo. IV. c. 7, s. 36.)

1. Jesuits or members of Religious Orders or Societies of the Church of Rome, bound by monastic or religious vows, coming into the kingdom. (10 Geo. IV. c. 7, s. 29); or

2. Having obtained the Secretary of State's licence to come into the kingdom, within twenty days after the date of the licence mentioned in such licence. (10 Geo. IV. c. 7, s. 31.)

3. Within any part of the kingdom, becoming a Jesuit or member of any Society of the Church of Rome bound by monastic or religious vows. (10 Geo. IV. c. 7, s. 54.)

III. Transportation for the term of fourteen years, or, in mitigation or commutation of such punishment, the offender to be publicly whipped, fined or imprisoned, or all or any one or more of them.

1. Not being a contractor with the Commissioners of the Navy, Ordinance or Victualling Office for her Majesty's usual selling, receiving or being possessed of any warlike or naval, ordnance, victualling or other public stores, without being able to produce a certificate from the Commissioners of the Navy &c. expressing the situation of such stores being so in possession. (9 & 10 Wm. III. c. 41; 9 Geo. I. c. 8, s. 3; 39 &

* The 1 & 2 Geo. IV. c. 74, s. 4, contains a similar provision as regards buoys &c. within the jurisdiction of the Channel Ports, but subjects the offender to transportation not exceeding fourteen years.

† This and the next two offences do not apply to members of Female Societies.

‡ The mode in which the 29 & 30 Geo. III. c. 89, s. 1, imposes the above penalties in respect of those offences, is by enacting that persons who commit them shall be judged according to the law of nations, and shall, and shall be convicted thereof in due form of law, be transported beyond the seas, for the term of fourteen years, in manner of other receivers of stolen goods are directed to be transported by the laws and statutes of this kingdom. (See secs. 49 & 50.)

§ In the case of these two matters, the courts are required to make an order in respect of the above penalties, and for the purpose of carrying them into effect, or on conviction, or otherwise as they shall think fit.

∥ The word "game" includes hare, pheasants, partridge, grouse, buzzard, heron, eagle, and bustards.

* For the purposes of 9 Geo. IV. c. 69, the word "game" includes hare, pheasants, partridge, grouse, buzzard, heron, eagle, and bustards.

∥ The punishment for this offence is imprisonment not exceeding one year.

† See the 5 & 6 Geo. IV. c. 100, s. 17, which declares that persons winning money, &c. by cheating at cards or other games, shall be guilty of obtaining such money, &c. by false pretences, and shall be punished accordingly.

‡ The punishment for a misdemeanor at common law is fine and imprisonment.

|| It is only when the offender is prosecuted under 5 Eliz. c. 59, that he is liable to this portion of these penalties. If prosecuted at common law he is punishable with fine and imprisonment, but may be sentenced to other penalties stated above. The common law offence extends also to subornation of perjury in any judicial proceeding.
with hard labour for a term not exceeding seven years, or may not exceed seven years; and, in addition to or in lieu of the before-mentioned punishments, may be imprisoned with hard labour for any term not exceeding the term for which he may be imprisoned as aforesaid; and, if in any of the cases mentioned he be convicted as a witness in any court of record, unless the judgment given against him be reversed.

1. Subornation of perjury in any of the Queen's Courts of Chancery, Court of Record, or in any Leet, View of Frankpledge, or Law-day, Ancient Demesne Court, Hundred Court, Court Baron, or in the Court or Courts of the Stannary in the counties of Devon and Cornwall; or suborning witnesses sworn to perjury, or perjury by the government or regiment.* (5 Eliz. c. 30, s. 3, 4, and 5; 29 Eliz. c. 5; 21 Jac. I, c. 28, s. 8; 2 Geo. II. c. 24, s. 2; 3 Geo. IV. c. 114; 7 Wm. IV. & 1 Vict. c. 23.)

XIII. Fine of 20l. and imprisonment for six months; and besides the before-mentioned punishment the offender may be imprisoned with hard labour for a term not exceeding seven years, or transported for a term not exceeding seven years; and, in addition to or in lieu of the before-mentioned punishments, may be imprisoned with hard labour for any term not exceeding the term for which he may be imprisoned as aforesaid; and the offender on conviction cannot thenceforth be received as a witness in any Court of Record, unless the judgment given against him be reversed.

1. Perjury in any of the Courts mentioned above in the case of subornation of perjury, or by any person examined as a witness. (5 Eliz. c. 30, s. 3, 4, and 5; 29 Eliz. c. 5; 21 Jac. I, c. 28, s. 8; 2 Geo. II. c. 25, s. 2; 3 Geo. IV. c. 114; 7 Wm. IV. & 1 Vict. c. 23.)

2. Seamen or marines attempting to obtain their pay by means of forged certificates of their discharge from the queen's ships, or from hospitals or sick-quarters. (11 Geo. IV. & 1 Wm. IV. c. 20, s. 89; 7 Wm. IV. & 1 Vict. c. 23.)

3. Forgery of certificates of the Commissioners for executing the Peace, and for High Admiration, or of seas or sale of any naval or signalling vessels. (2 Wm. IV. c. 40, s. 32; 7 Wm. IV. & 1 Vict. c. 23.)

4. Making false declarations or signing false notices for the purpose of procuring marriages; or

5. Forbidding the issue of any superintendent registrar's certificate, by falsely representing oneself to be a person whose consent to such marriage is required by law. (6 & 7 Wm. IV. c. 60, s. 41; 7 Wm. IV. & 1 Vict. c. 23.)

XIV. Transportation for seven years, or imprisonment with hard labour for any term not exceeding three years.

1. Assisting or obstructing persons duly employed for the purpose of securing justice. (6 & 7 Wm. IV. c. 60, s. 41; 7 Wm. IV. & 1 Vict. c. 23.)

XV. Transportation for seven years, or imprisonment with or without hard labour for any period not exceeding three years; and during such imprisonment the offender may be punished as often and in such manner and form as the Court shall direct, not exceeding thrice.

1. Discharging or aiming fire or other arms, or discharging or attempting to discharge any explosive substance, at or near the person of the queen, or striking or attempting to strike at the person of the queen, or in any other manner throwing or attempting to throw anything at or upon her person, with intent to injure or alarm the queen or to break the public peace, or whereby the public peace may be endangered; or having fire or other arms, or any explosive or dangerous matter or

* See also 18 Geo. III, c. 29, s. 4 (made perpetual by 21 Geo. II, c. 33), as to subornation of perjury and perjury by agents, &c., for which the court may cause them, after an examination in a summary way, to be transported for seven years, if they do not appear to be indelible.

† It is only when the offender is proceeded against under Eliz. c. 9, that he is liable to transportation, and not to imprisonment. These provisions are for common law offenses as well as for offenses at common law, and not under the statute.

‡ A public breach of the peace, although mentioned above, by which cases of false swearing are declared to be perjury, or to be punishable as perjury; but it would have occupied too much space to have inserted them.

§ For the definition of fraud, see p. 172, note *

∥ The first two offenses are punishable on summary conviction.

¶ This forfeiture, in lieu of other fines or penalties, is to be levied by the mariners above, constituted the offense a felony.

‖ The punishment for the first offense is fine of 10l. and imprisonment for one year. (5 Eliz. c. 16, s. 7.)

* This offense is to be considered as virtually obsolete.

† The punishment for the first offense is imprisonment for six months, and for the second and third offenses, a fine of 10l. and imprisonment for any term not exceeding one year. (5 Eliz. c. 16, s. 7.)

∥ This offense is to be considered as virtually obsolete.

¶ The punishment for the first offense is imprisonment for six months, and for the second offense, a fine of 10l. and imprisonment for any term not exceeding one year. (5 Eliz. c. 16, s. 7.)

‖ Besides being imprisoned, the offender for the first offense forfeits the
3. Persons not having any spiritual promotion committing any such last-mentioned offence, after their first conviction.  
(35 Geo. III. c. 60, s. 13.)

4. Furtive driving, &c., by persons having charge of stage-coaches or public carriages, not being hackney-coaches drawn by two horses only, and not plying for hire as stage-coaches, whereby any person is injured. (1 Geo. IV. c. 4.)

5. Buying or offering to sell, or attempting to sell, or engaging in any place of business in any manner relating to the sale or purchase thereof. (5 & 6 Edw. VI. c. 16; 40 Geo. III. c. 196, s. 3; 6 Geo. IV. c. 105, s. 10.)

6. Officers exacting fees from prisoners against whom no bill of indictment is found by the grand jury, or who are acquitted on their trial or discharged by proclamation for want of prosecution. (36 Geo. III. c. 60, ss. 4 and 9.)

7. Officers of excise or excisemen by the misconduct causing waste, &c., in merchandise warehoused in warehouses under the Act for permitting goods imported to be secured in warehouses without payment of duty on first entry. (4 Geo. IV. c. 24, s. 72.)

8. False certificates or representations endeavouring to obtain from Chelsea Hospital any pension, privilege or advantage. (7 Geo. IV. c. 16, s. 25.)

9. Setting spring-guns or man-traps, except within a dwelling-house, between sun-set and sun-rise, for the protection thereof. (7 & 8 Geo. IV. c. 18, ss. 1 and 4.)

10. Jesuits, or members of any religious order or society of the Church of Rome, by monastic or religious vows, within the United Kingdom, admitting any person to become a member of any such order or society. (10 Geo. IV. c. 7, s. 8.)

11. Parish officers refusing to call meetings, &c., according to the provisions of the Act for the better Regulation of Vestries. (1 & 2 Wm. IV. c. 60, s. 11.)

12. Making false answers to any of the questions directed by the Reform Act to be put by the returning officer at elections of members of parliament, if required by any candidate, to any voter at the time of his tendering his vote. (2 & 3 Wm. IV. c. 45, s. 58.)

13. Refusing to attend, &c., the Poor Law Commissioners (4 & 5 Wm. IV. c. 76, s. 13); the Tithe Commissioners (6 & 7 Wm. IV. c. 71, s. 88); or the Copyhold Commissioners (4 & 5 Wm. IV. c. 36, s. 94).

14. Forgery, &c., of protections from service in the navy. (5 & 6 Wm. IV. c. 24, s. 3.)

15. Making false declarations in cases where declarations are substituted for oaths by the Act for abolishing unnecessary Oaths. (5 & 6 Wm. IV. c. 62, s. 21.)

16. Executing &c., renewed ecclesiastical leases, knowing the rent required by law contained therein to be false. (6 & 7 Wm. IV. c. 76, s. 6.)

17. Making false declarations in cases where declarations are substituted for oaths by the Act for abolishing unnecessary Oaths. (5 & 6 Wm. IV. c. 62, s. 21.)

18. Making false statements in declarations required to be delivered to the Commissioners of Stamps and Taxes before being allowed to print and publish newspapers. (6 & 7 Wm. IV. c. 76, s. 6.)

19. Making, &c., false declaration of being qualified to be elected a member of the House of Commons. (1 & 2 Vict. c. 45, s. 7.)

20. Falsehood in statements of pensions for service in her Majesty's navy, royal marines or ordinance. (2 & 3 Vict. c. 51, s. 8.)

21. Making false declarations touching any of the matters contained in the Act for procuring Returns relative to Highways and Turnpikes. (2 & 3 Vict. c. 40, s. 9.)

22. Officers of railways making false returns, under the authority of the entrance, commitment or discharge of such prisoners, or detaining prisoners for non-payment of fees. (55 Geo. III. c. 60, s. 13.)

* They are also, upon conviction, rendered incapsable of holding their offices.

† See the 3 Geo. IV. c. 36, s. 19.

‡ It would appear that whereas a person is made to find sureties and recognizances, he is not to be deemed as having been convicted of all his spiritual promotions.

§ As declared by the Act.

‖ The punishment for the first offence is imprisonment for six months; and for the second offence, imprisonment for twelve months.

¶ No person committing any of the above offences during the first three years for which he was convicted is disqualified for holding any office of profit, which he is made to forfeit, and sold to the purchaser, if the purchaser be willing to purchase it. But if any person, before the expiration of that period, makes a new purchase or sale of the same office, the purchaser is not thereby enabled to take possession of the office, but such new purchase or sale is, under the Act, void.

‖‡ That is, as declared by the judges.

†† The offender is also, on conviction, rendered for ever incapable of holding or copying any office under the crown.

* This office does not apply to female societies. (10 Geo. IV. c. 7, s. 7.)
Act for regulating railways, to the committee of the Privy Council for Trade. (5 & 6 Vict. c. 97, s. 4.)

23. Making false returns of corn, under the Act regulating the importation of corn. (5 & 6 Vict. c. 14, s. 43.)

24. Making false entries in the Register Book of Copyrights. (5 & 6 Vict. c. 46, s. 12.)

25. Voters making false answers to returning officer at elections of members of parliament. (6 & 7 Vict. c. 18, s. 81.)

26. Actuaries or other persons holding appointments in savings' banks, receiving deposits and not paying the same over to the managers of such banks, &c. (7 & 8 Vict. c. 83, s. 4.)

27. The registrar of joint-stock companies or any person employed under him, demanding or receiving any gratuity, or reward beyond the fees allowed by law. (7 & 8 Vict. c. 110, s. 22.)

28. Directors of joint-stock companies by whom certificates of shares are issued, making false statements on such certificates as to the date of the first complete registration of such companies. (7 & 8 Vict. c. 110, s. 26 in part.)

29. Persons knowing dogs or skins of dogs found in their possession, by virtue of a search warrant, to be stolen dogs, or the skins of stolen dogs (for the second offence). (6 & 9 Vict. c. 47, s. 3 in part.)

30. Corruptly taking any reward for aiding persons to recover stolen &c. dogs. (6 & 9 Vict. c. 47, s. 6.)

31. Offences against the provisions of the 8 & 9 Vict. c. 100 (An Act for the regulation of the care and treatment of Lunatics), and the 8 & 9 Vict. c. 126 (An Act to amend the laws for the provision and regulation of Lunatic Asylums for counties and boroughs, and for the maintenance and care of Pauper Lunatics, in England), declared by those Acts to be misdemeanours.

32. Using contemptuous words or gestures of or against the queen.

33. Unlawful assemblies.

34. Riots.

35. Riots.

36. Affrays.

37. Conspiracy.

38. Bribery.

40. Blasphemous or seditious libel.

41. Unlawfully refusing to serve public offices.

42. Executing official duties before taking oath of office and giving security, where the same are required by law.

43. Willfully disobeying any statute, by doing what it prohibits or omitting what it commands, whereby the public are or may be injured.

44. Willfully disobeying any lawful warrant, order or command of her Majesty, or any court or person acting in a public capacity and duly authorized in that behalf, where no other penalty or mode of proceeding is expressly provided.

45. Obstructing officers in the execution of any public office or duty.

46. Excess or abuse of authority by public officers.

47. Extortion by public officers.

48. Forfeiture for fraudulent misappropriation by public officers of property under their control as such officers.

49. Unlawfully, and contrary to oath of office, disclosing matter the knowledge of which has been acquired in an official capacity.

50. Assaulting &c. persons on account of anything done by them in connexion with any judicial proceeding.

51. Contempt of courts of justice or magistrates, by uttering scurrilous, insolent, profane, or menacing words, or by acts or gestures expressed or done in the face of such courts or in the presence of such magistrates.

52. By force, or by violent or outrageous conduct, interfering with the proceedings of courts of justice.

53. The wilful omission by judicial officers to do their duty.

54. Oppression by judicial officers.

55. Judicial officers taking bribes.

56. Bribery or otherwise corruptly influencing judicial officers.

57. Persons procuring themselves to be returned as jurors, with intent to obtain a verdict or any undue advantage for any person interested in a trial.

58. Unlawfully preventing persons from serving as jurors.

59. Justices influencing their verdicts by any improper means.

60. Witnesses refusing to be sworn or to give evidence in judicial proceedings.

61. Unlawfully preventing witnesses from giving evidence in judicial proceedings.

62. Endeavouring to procure the commission of perjury.

63. Publishing statements, pending suits or prosecutions, with intent to excite prejudice for or against any party to such suits or prosecutions.

64. Fabricating false evidence.

65. By disposing of dead bodies, without giving notice to the coroner, in cases where inquests ought to be taken, obstructing the taking of such inquests.

66. Gaolers and others, contrary to their duty, allowing dead bodies to remain unburied and to putrefy, without giving notice to the coroner, in cases where inquests ought to be taken.

67. Challenging or provoking to fight, or to commit a breach of the peace.

68. Open indecency in places of public resort or in view thereof.

69. Keeping gaming or other disorderly houses.

70. Arresting or otherwise obstructing the burial of dead bodies.

71. Unlawfully disinterring dead bodies.

72. Buying or selling wines.

73. Selling unwholesome provisions.

74. Maliciously exposing persons labouring under contagious diseases in places of public resort.

75. Common nuisances.

76. Corrupting wells or springs used by the public.

77. Impeckners refusing to receive travellers, their turns not being fully occupied at the time, and a reasonable sum being tendered for accommodation.

78. Battery.

79. False imprisonment.

80. Assaults.

81. Persons maiming themselves, with intent to evade the discharge of any public duty.

82. Cheats.

83. Forgery, in cases where no punishment is provided by statute.

84. Concealing treasure-trove.

85. Forfeiture, fine not exceeding 200L, and costs of suit, for keeping a dog, suit, or other thing, falsely marked, for additional ends, or with intent to evade, or effectually to prevent, imprisonment, or any of them, in such manner and for such space of time as to the court shall seem meet.

1. Being possessed (not being a contractor with the Commission for Inland Waterways, Ordnance, or any other public body, nor being charged to be new, or not more than one-third worn. (39 & 40 Geo. III. c. 89, s. 2; 54 Geo. III. c. 50; 55 Geo. III. c. 127; 56 Geo. III. c. 138, s. 2.)

2. Making, being possessed of, or concealing (not being a contractor as last mentioned) any warlike or naval stores, with the marks used by her Majesty's warlike, naval, or ordnance stores, or any other public stores. (9 & 10 Wm. IV. c. 68, s. 6; 16 Geo. II. c. 8; 17 Geo. II. c. 40; 39 & 40 Geo. III. c. 89, s. 2; 54 Geo. III. c. 60; 55 Geo. III. c. 127; 56 Geo. III. c. 138, s. 2.)

XXXII. Fine not exceeding 500L, or imprisonment for any term, for being possessed of two years or less.

1. Aiding the escape of convicts from New South Wales or Van Diemen's Land. (9 Geo. IV. c. 88, s. 34.)

XXXIII. Imprisonment, with or without hard labour, for such an act as the court shall award.

* The first offence is punishable on summary conviction before two or more persons acting as such, not exceeding 20L, as to the justices shall seem meet.

1. This and the following fifty-two offences (39 to 44 inclusive) are misdemeanours at common law, and as such, punishable with fine and imprisonment, as in the Seventeenth Report of the Criminal Law Commissioners, and the authorities thereon. (39 & 40 Geo. III. c. 89, s. 20.)

2. These offences, when committed for a second time, were made punishable as misdemeanours only punishable, by 6 Geo. III. & 1 Geo. IV. c. 9, s. 3; but 11 Geo. IV. & 1 Will. IV. c. 73, repealed the latter portion of the punishment.
1. Unlawfully and carnally knowing girls above the age of ten and under the age of twelve years. (9 Geo. IV. c. 31, s. 17.)

XXXIV. Fine or imprisonment, or both, such imprisonment to be without or without hard labour or solitary confinement, or with both.

1. Unlawfully taking or killing hares or conies, in the night time, in warrens. (7 & 8 Geo. IV. c. 29, ss. 4 and 30.)

2. Unlawfully taking or killing any fish in waters running through or in lands adjoining or belonging to dwelling-houses. (7 & 8 Geo. IV. c. 29, ss. 4 and 34.)

3. Unlawfully destroying turnpikes or toll gates or houses, &c. (7 & 8 Geo. IV. c. 30, s. 14 and 57.)

4. Officers of the Post-Office opening or detaining post letters (7 Wm. IV. & 1 Vict. c. 36, ss. 25 and 42;) or stealing, embezzling, or destroying printed votes or proceedings in Parliament, or printed newspapers, or other printed papers sent by the post, without covers or in covers open on the sides. (7 Wm. IV. & 1 Vict. c. 36, ss. 25 and 42.)

XXXV. Fine or imprisonment, or both, such imprisonment to be with or without hard labour.

1. Forgery of hackney-carriage plates (1 & 2 Wm. IV. c. 22, s. 25;) of stage-carriage plates (2 & 3 Wm. IV. c. 120, s. 32;) or of the licences or tickets of drivers of hackney-carriages, drivers or conductors of stage-carriages, or watermen (1 & 2 Vict. c. 79, s. 12.)

2. Frauds in applying for hackney-carriage or stage-carriage licences. (1 & 2 Wm. IV. c. 22, s. 33; 2 & 3 Wm. IV. c. 120, s. 10.)

XXXVI. Fine or imprisonment, or both.

1. Compounding offences, &c. or otherwise offending against the provisions of the 18 Eliz. c. 5 (An Act to redress disorders in common and other places.) (18 Eliz. c. 6, s. 4; 27 Eliz. c. 10; 56 Geo. III. c. 188, s. 2.)

2. Resting the execution of any legal process, execution, or arrest, without legal reasons, or by the violence of a person having no right to recover such property, or for any purpose whatever. (12 Savoy, Old Bailey, &c.)

3. Illegal imprisonment. (53 Geo. III. c. 141, s. 9.)

4. Persons having the custody of offenders ordered to be confined in Parkhurst Prison, or Pentonville or Millbank Prison, carelessly allowing such offenders to escape. (1 & 2 Vict. c. 82, s. 13; & 5 & 6 Vict. c. 29, s. 25 in part; & 6 & 7 Vict. c. 26, s. 25 in part.)

5. Offences against the Foreign Enlistment Act. (59 Geo. III. c. 69, s. 2.)

6. Unlawfully taking unmarried girls under the age of 16 years out of the possession of those who have the lawful care and control thereof. (18 Eliz. c. 6, s. 4; 27 Eliz. c. 10; 56 Geo. III. c. 188, s. 2.)

7. Arresting clergymen on public process while employed about the performance of divine service. (9 Geo. IV. c. 31, s. 22.)

8. Frauds by Excise officers in the granting of permits, or in the performance of their duties in relation to the same. (2 Wm. IV. c. 16, s. 15.)

9. Altering, destroying, counterfeiting, or trafficking in the register-tickets with which merchant seamen are required to provide themselves. (7 & 8 Vict. c. 112, s. 21.)

10. Making false answers to questions by the registrar of seamen, &c. with reference to the granting of such tickets. (7 & 8 Vict. c. 112, s. 22.)

11. Masters of merchant ships, without the sanction of the consul, &c. discharging or abandoning aboard persons belonging to their ships or crews, or, in case any such person should desert aboard, neglecting to give any public notice in writing to such consul, &c. (7 & 8 Vict. c. 112, s. 46.)

12. Masters, mates, or other officers of merchant ships, wrongfully forgoing on shore, or losing behind on shore or sea, persons belonging to their ships or crews, before the completion of the voyage for which such persons were engaged, or the return of their ships to the United Kingdom. (7 & 8 Vict. c. 112, s. 47.)

13. Masters of merchant ships omitting, when required by the consul, &c. on the complaint of three or more of their crew, to provide proper provisions, water, or medicines, or the requisite certificates thereof, or using any provisions, &c. which the consul, &c. shall have signified to be unfit for use or inappropriate. (7 & 8 Vict. c. 112, s. 57.)

XXXVII. Imprisonment for three years, and fine at the queen's pleasure.†

1. Chapmery. (3 Edw. I. c. 25; 13 Edw. I. st. 1, c. 49; 28 Edw. I. st. 1, c. 11; 33 Edw. I. st. 2; 33 Edw. I. st. 3; 4 Edw. III. c. 7; 4 Edw. III. c. 14; 4 Edw. III. c. 4 and 5; 5 Rich. II. c. 15; 32 Hen. VIII. c. 9.)

2. Maintenance. (3 Edw. I. c. 28 and 33; 33 Edw. I. st. 3; 1 Edw. III. st. 2, c. 14; 4 Edw. III. c. 11; 20 Edw. III. c. 4 and 5; 1 Rich. I. c. 4 and 7.; 7 Rich. II. c. 15; 32 Hen. VIII. c. 9.)

XXXVIII. Great forfeiture.

1. Disturbing any to make free election. (3 Edw. I. c. 5.)

XXXIX. To be adjudged incapable and disabled in law to have or enjoy any office or employment, ecclesiastical, civil or military, or any part in them, or any profit or advantage appertaining to them; and if the offender at the time of being convicted or possessed any office, place or employment, the same is made void.

1. Having been educated in or professed Christianity within this realm, asserting that there are more Gods than one, or denying the Christian religion to be true, or the Scriptures to be of Divinity authority. (9 & 10 Wm. III. c. 32, s. 1; 55 Geo. III. c. 160, s. 2.)

XL. Imprisonment and hard labour for any period not exceeding three years, without or with hard labour, or solitary confinement, or with both.

1. Insolvent debtors or petitioners for protection from process, omitting in their schedules any property, or retaining or excepting out of such schedules, as necessary, property of greater value than 20l., with intent to defraud their creditors. (1 & 2 Vict. c. 110, ss. 99 and 121; 7 & 8 Vict. c. 96, s. 39.)

XLI. Imprisonment for any term not exceeding three years, with or without hard labour, or solitary confinement, or with both.

1. Being posessed of three or more pieces of counterfeit coin, intended to pass for the Queen's current gold or silver coin, knowing the same to be counterfeit and with intent to utter the same. (2 Wm. IV. c. 34, ss. 8 in part and 15.)

XLII. Imprisonment with hard labour for any term not exceeding three years, either in addition to or in lieu of any other punishment or penalty which may be inflicted upon the offender.

1. Being armed, assaulting Excise officers whilst searching for or seizing commodities forfeited under any Act relating to the duty of the Excise. (Excise or Excise officers, &c. with intent to defraud or to render offensive to arrest offenders. (7 & 8 Geo. IV. c. 53, ss. 40 and 43.)

XLIII. Imprisonment for any term not exceeding three years, with or without hard labour.

1. Bankrupts, partners, members of incorporated commercial or trading companies which shall be adjudged bankrupt, falsifying or destroying their books, &c. with intent to defraud their creditors. (5 & 6 Vict. c. 122, s. 34; 7 & 8 Vict. c. 111, s. 30.)

2. Publishing or threatening to publish libels, &c. with intent to extort money. (6 & 7 Vict. c. 96, s. 8.)

XLIV. Imprisonment for one year and grievous fine at the queen's pleasure; or if the offender have not wherewithal, imprisonment for three years.

1. Misprision of felony by sheriffs, coroners, or other bailiffs. (3 Edw. I. c. 9.)

2. Imprisonment for one year and grievous fine; or if the offender have not wherewithal, imprisonment for two years.

1. Bailiffs not being ready, on the hue and cry, to arrest felons. (3 Edw. I. c. 9.)

See also Geo. IV. c. 51, s. 30, which makes it a misdemeanour, punishable with imprisonment for such term as the court shall determine. The case of merchant ships to forec lose on shore or refuse to bring home all the men whom they contain out as are in condition to return. The case of offences of Cheapside and Maintenance is recommended by the Criminal Law Commission of the 19th Report in the Fifth Part.†

† That is, as declared by the judges. This punishment is taken from 33 Edw. I. c. 2 (Statute of Chesterfield, &c. for preserving the peace of the city of Chesterfield, &c. within the limits of the city of Chesterfield, &c. by keeping the peace, &c. within the limits of the city of Chesterfield, &c. for the suppression of the said public tumults, &c. with intent to defraud their creditors. (5 & 6 Vict. c. 122, s. 34; 7 & 8 Vict. c. 111, s. 30.)

† For a first offence the above penalties may be relieved by remission of such compound imprisonment in the same court where the offender was convicted, within four months after such conviction. (s.)

† If a person be a seaman, and, as such, engages in any foreign service of war, or in any other service of war, or the service of his country, he is to be imprisoned for three years, and to be disabled to sue, &c. in any court of law within this realm, or of any other country, or of any other person, or any child, or executor or administrator of any person, or any cap, or any legacy or deed of gift, or to bear any office, civil or military, or any benefit ecclesiastical, for ever within the realm. (s.)

Sec. 11.-2 A
XLVI. Imprisonment with or without hard labour for any term not exceeding seven years, and if the court shall think fit; and the offender may be required to find sureties for keeping the peace.

1. Assaults with intent to commit felony, or on any peace or circuit officer, or with intent to resist the lawful apprehension or detention of any person, or in pursuance of any conspiracy to raise the rate of wages (9 Geo. IV. c. 31, s. 25); or on special constables. [*] (9 Geo. IV. c. 31. s. 25; 1 & 2 Wm. IV. c. 35, s. 1.)

XLVII. Fine and imprisonment not exceeding two years.

1. Being present at meetings unauthorised by her Majesty, &c., for the purpose of being drugged to the use of arms, or, at such meetings, being so drugged. (90 Geo. III. 1 & Geo. IV. c. 1, s. 1.)

2. Maliciously publishing defamatory libels, knowing them to be false. (6 & 7 Vict. c. 96, s. 4.)

XLVIII. Imprisonment for any term not exceeding two years, with or without hard labour or solitary confinement, or with both. 

1. Soliciting the commission of any felony or misdemeanor punishable by the Post-Office Acts. (7 Wm. IV. 1 & Vict. c. 36, ss. 50 and 42.)

XLIX. Imprisonment with hard labour for any term not exceeding two years.

1. Personating voters at elections of members of Parliament. (6 & 7 Vict. c. 18, s. 88.)

L. Imprisonment with or without hard labour for any term not exceeding two years.

1. Working, by forced labour, &c., endeavouring to conceal the birth of children of which they have been delivered. (9 Geo. IV. c. 31, s. 14.)

2. Bankrupt, within three months next preceding his bankruptcy, obtaining goods on credit under the false pretence of dealing in the ordinary course of trade. (6 & 8 Vict. c. 129, s. 35.)

3. Drunkenness or other misconduct of servants of railway companies. [*] (3 & 4 Vict. c. 97, s. 13.)

LI. Imprisonment for a term not exceeding two years.

1. Embracing on board slaves in the capacity of petty officers, seamen, &c. (6 Geo. IV. c. 113, s. 11; 3 & 4 Wm. IV. c. 73.)

2. Doing any thing to obstruct carriages on railways or to endanger the safety of persons conveyed upon the same. (3 & 4 Vict. c. 97, s. 15.)

LII. Imprisonment for one year, and such further punishment by fine or imprisonment, or both, as to the court shall seem most proper, and the offender to give sureties for good behaviour and to be further imprisoned until they be given. 

1. Witchcraft, fortune-telling, &c., or pretending to discover where property supposed to be stolen or lost may be found. (9 Geo. II. c. 5, s. 4; 56 Geo. III. c. 138, s. 2.)

LIII. Fine or imprisonment, or not exceeding eighteen months, or both, with or without hard labour.

1. Dog-stealing (for the second offence). (8 & 9 Vict. c. 47, s. 2 in part.)

LV. Possession of goods and chattels, real and personal, &c., and if the offender have not goods and chattels to the value of 20l., then, in addition, imprisonment for one year.

1. Maintaining the authority, spiritual or ecclesiastical, of any foreign prince or state claimed within this realm or any of the dominions under the queen's obsequies before the passing of the 1 Eliz. c. 1. [*] (1 Eliz. c. 1, ss. 27 and 28; 7 & 8 Vict. c. 102.)

LV. Imprisonment for any term not exceeding one year, with or without hard labour or solitary confinement, or with both.

1. Uttering counterfeit coin intended to pass for the queen's currency coin, or being possessed of three or more pieces of such coin with intent to utter the same. (2 Wm. IV. c. 34, ss. 12 and 19.)

[*] Assents on special constables may also be published on summary conviction before two justices. (See 1 & 2 Wm. IV. c. 61.)

[*] If published on summary conviction, with imprisonment not exceeding two calendar months, or fine not exceeding 100l., if the person convicted shall make the sum of 20l. to his costs. (1839, 19 & 20 Vict. c. 30, s. 2.)

[*] This fine may be referred to the court at the Quarter-Sessions. (1839, 19 & 20 Vict. c. 30, s. 1.)

[*] This fine, being by statute, does not, as above observed, constitute the offence a felony. (1839, 19 & 20 Vict. c. 30, s. 1.)

[*] The repeal of this offence is recommended by the Commissioners for revising and consolidating the Criminal Law, 'on the ground of its causing great annoyances and disabilities in regard to religious opinions, dated 20th May, 1845.'
parliament, for alteration of matters established by law in church or state, without the previous order of three or more justices of the peace of the county, where the matter arises at the assizes or quarter-seessions, or, if arising in London, of the lord mayor, aldermen, and commons, in common council assembled; or, upon pretense of presenting a petition or other address being accompanied with an excessive number of people, or at any one time with above ten persons. (13 Car. II. c. 5, s. 2.)

LXV. Fine not exceeding 20l., or imprisonment with or without hard labor, for any term not exceeding three months, or fine not exceeding 50l.

LXVI. Offending against the provisions of the Act for regulating schools of anatomy. (3 & 3 Wm. IV. c. 75, s. 15.)

LXVII. Fine not less than 20l., and imprisonment with or without hard labor.

1. Neglecting or disobeying the orders of the Poor Law Commissioners or assistant commissioners, having been twice previously convicted of so doing.† (4 & 5 Wm. IV. c. 76, s. 88.)

LXVIII. Imprisonment until the offender brings into court him which was the first author of the tale, and, if he cannot find him, his motion for punishment as the council shall Adv. the same.†

1. Scandalum magnatum. (3 Edw. I. c. 34; 2 Rich. II. st. 1, c. 5; 12 Rich. II. c. 11.)

LXIX. Forgers.†

1. Members of incorporated commercial or trading companies against which a flat in bankruptcy has issued (not being the persons ordered to prepare the balance sheet), or any other person, wilfully concealing the estate of such companies.† (7 & 8 Vict. c. 111, s. 17.)

LXX. Fine of 40l.

1. Disturbing any religious assembly allowed by law. (1 Wm. & Mary, c. 18, s. 18; 31 Geo. III. c. 92, s. 10; 52 Geo. III. c. 155, s. 12.)

LXXI. Fine or imprisonment.

1. Embra. (6 Geo. IV. c. 50, s. 61.)

LXXII. Fine according to the trespass.

1. Illegal distresses. (52 Henry III. cc. 1, 2, 3, 4; 3 Edw. I. c. 16.)

LXXIII. Fine and ransom at the queen's will and pleasure.

1. Judges or clerks raising rolls, changing verdicts, &c. whereby ensue disharmony of any of the parties.† (8 Rich. II. c. 4.)

2. Heads of persons holding commissions to compound for the payment of first-fruits.** (26 Hen. VIII. c. 8, s. 4; 1 Eliz. c. 4, s. 24.)

LXXIV. Grotesque fine to the queen.

1. Not being present at the summons of sheriffs and the cry of the country, to arrest felons, when need is, as well within as without.†† (3 Edw. I. c. 9.)

LXXV. Grotesque punishment.

1. Not being present at the money wrongly from successful suitors or jurors, prisoners or others attached upon place of the crown.††† (3 Edw. I. c. 30.)

LXXVI. Punishment at the queen's will.‡

1. Imprisonment by sheriffs and other queen's officers. (3 Edw. I. c. 20; 1 Hen. IV. c. 11.)

LXXVII. Fine not exceeding 100l., at the discretion of the court.

LXXVIII. Objections against the Act for abolishing the truck system in certain trades. (1 & 2 Wm. IV. c. 37, s. 9.)

LXXX. To be at the queen's will of body, lands, and goods, thereof to be done as shall please her.

1. Justices bound of the rest of the parties contained in the oath required to be taken by them. (18 Edw. III. st. 4; 20 Edw. III. c. 1.)

LXXXI. Forfeiture of twenty shillings for every offence.†††

1. Drovers, travelling to and from London or their servants travelling or coming into their inns or lodgings upon the Lord's Day.†††† (29 Car. II. c. 7, s. 2.)

LXXXII. Forfeiture of 5s.

1. Persons of lawful age, fourteen or upwards, doing or exercising any worldly labour, business, or work of their ordinary calling on the Lord's Day (works of necessity and charity only excepted).††††† (29 Car. II. c. 7, s. 2.)

Besides the offenses enumerated above, there are several offenses against the Established Church which are indictable, but the penalties for which may be relieved against by complying with the provisions of what are commonly called the Toleration Acts. These offenses consist of:

1. The forbearing to resort to one's parish church on Sundays or other holy days, without some lawful or reasonable excuse for being absent, which constitutes the offender on conviction a recusant convict, and renders him liable to forfeit 12d. for every such offence, to the use of the poor of the parish where the offense is committed (1 Eliz. c. 2, s. 14), and, in addition thereto, to pay into the exchequer the rate of 20l. for every second and other offense which shall be contained in the indictment upon which he is convicted; and also, having been once convicted, to forfeit without further indictment or conviction 20l. to the use of the poor for every fourth month of so farreaching (29 Eliz. c. 6, s. 4; 3 Jac. I. c. 4, s. 8). He also, previously to the passing of the 7 & 8 Vict. c. 102, which repealed the Acts imposing them, became liable to numerous disabilities, amounting in effect to outlawry. A Roman Catholic who so forborne to resort to his parish church, became on conviction a Popish recusant convict, and liable to additional penalties and disabilities beyond those which attached to recusants convict. The offense has, however, been repealed by the before-mentioned Act of the 7 & 8 Vict. c. 102, as regards Roman Catholics.

2. The relieving, harbouring, or keeping recusants in the house, the penalty for every month of so farreaching, which is 10l. (3 Jac. I. c. 4, ss. 32 and 33). The 7 & 8 Vict. c. 102, also repealed this offense so far as it is related to Popish recusants.

3. Schoolmasters teaching in private families without license from their archbishop, &c., and before subscribing a declaration of their conformity to the Liturgy; for which they are liable, for the first offense, to suffer three months' imprisonment, and for every second and other offense the like imprisonment, and to forfeit 5l. to the queen. (13 & 14 Car. II. c. 4, ss. 11 and 12; 1 Wm. and Mary, ses. 1, c. 8, s. 11.)

4. Popish bishops, priests, or Jesuits, saying mass or exercising any of their functions within the queen's dominions, or Papists keeping school or educating youth within the same, whereby, upon conviction, they become liable to perpetual imprisonment. (3 Jac. I. c. 4, s. 3.) Roman Catholics were also liable to many other severe penalties for promoting or exercising their religion, until these were repealed by 7 & 8 Vict. c. 102. It will be seen that the two former of the above offenses no longer apply to Roman Catholics. The two latter are, however, still in force with respect to them as well as all other classes of the queen's subjects.

The offense of forbearing to resort to church is repealed by the Protestant Dissenters' Toleration Acts (1 Wm. & Mary, ses. 1, c. 15, ss. 13 and 16; and 52 Geo. III. c. 155, ss. 4 and 14) in favour of such persons who go to public worship for religious worship, but only under provisions specified by law. Quakers, however, must also, in addition, make the declaration of fidelity, as it is called, and subscribe a profession of their Christian belief. By the provisions of the Toleration Acts, the law of religious liberty, or keeping recusants is no longer

† Lord Mansfield declared it to be the unanimous opinion of the court, that neither the Bill of Rights (1 Wm. & Mary, sess. 1, c. 2) nor any other Act had any operation against the right of the crown. (3 & 3 Wm. IV. c. 5, s. 5.)

‡ The first and second offences are punishable on summary conviction only.

§ Such offenders also forfeit double the value of the estate conveyed.

‖ The punishment by 1 Wm. & Mary, c. 18, s. 14 (12 Stat. Laws. Toleration Act), was 20l. only. As regards the former there is no doubt that 38 Geo. III. c. 155, with which however this Act of Parliament Dissenters', has superseded it; but it may be a question whether, notwithstanding the generality of its terms, it has superseded the provision of Geo. III. c. 5. (3 & 3 Wm. IV. c. 5, s. 5.)

¶ For the meaning of ransom and queen's will and pleasure, see p. 175.

† The offender and must also satisfy the party.

‡ For the meaning of queen's will, see p. 175, col. 1, note ‡.

§ Such offenders are also to pay to the complainants treble the value of what they shall receive.

‖‖ For the meaning of queen's will, see p. 176, col. 1, note ‡.
repealed in favour of Quakers who make the declaration and subscribe the profession before alluded to, and of all other Protestant Dissenters who resort to some congregation in the United Kingdom, or are otherwise indulged in the worship of Quakers allowed by law, or take the oaths of allegiance and supremacy, or (since the passing of the 3 & 4 Wm. IV. cc. 49 and 82, in case such Dissenters are on foreign service) make a declaration to the effect of such of such oaths. The penalties imposed upon schoolmasters teaching without licence from the archbishop, &c. are repealed in favour of Protestant Dissenters who take the oaths of allegiance and supremacy or (since the passing of the 3 & 4 Wm. IV. cc. 49 and 82,) make a declaration to the effect thereof, or, if Quakers, make the declaration of fidelity and profession of their Christian belief before alluded to, and make a declaration that they believe in the Scripture scriptures as received among Protestant churches. (1 Wm. and Mary, sess. 1. c. 18. s. 13; 8 Geo. I. c. 6; 19 Geo. III. c. 44, s. 2; 10 Geo. IV. c. 7, s. 1; & 8 & 4 Wm. IV. cc. 49 and 82.) Papists bishops, &c. saying mass, &c., and Papists keeping school or educating youth, are relieved from the penalties for so doing, provided they take the oath appointed by the Roman Catholic Relief Act (10 Geo. IV. c. 7). See the 31 Geo. III. c. 92, ss. 3, 4, and 18; and 10 Geo. IV. c. 7, ss. 2 and 23.

Persons committing any of the before-mentioned offences against the Established Church, may, also, in general, prevent the taking of the oaths of allegiance and supremacy, and thus of conforming to the law. Members of the Established Church are not within the Toleration Acts, and the only mode, therefore, in which they can escape the penalties for the non-taking of the oaths, is by conforming to the law. Neither do Acts apply to Jews.

There are also two offences, having, however, much more of a political than of a religious character, which subject the person committing them to be adjudged Quaker recusants convict, and as such to forfeit and be proceeded against. These are, refusing to take the oaths of allegiance and abjuration, or to make the affirmations or declarations allowed by law in lieu thereof, when tendered by two justices of the peace or other authorized persons (1 Geo. I. st. 2, c. 13, s. 10; 8 Geo. I. c. 6; 6 Geo. III. c. 53; 3 & 4 Wm. IV. cc. 49 and 82; 1 & 2 Vict. c. 77;) and peers or members of either House of Parliament, sitting or voting therein or coming into the queen’s presence, before they have taken the oaths of allegiance and supremacy, or taken or made the oath, affirmations or declarations allowed by law in lieu thereof. (30 Car. II. st. 2, s. 2, 5, and 6; 8 Geo. I. c. 6; 31 Geo. III. c. 22, s. 20; 10 Geo. IV. c. 7, ss. 2, 4, and 23; 3 & 4 Wm. IV. cc. 49 and 82; 1 & 2 Vict. c. 77.) Peers and Members of Parliament are liable in respect of the latter of these offences to many disabilities, and to a fine of £100, in addition to the penalties consequent on being adjudged Quaker recusants convict. The repeal of the four first-mentioned offences relates only to the intended Oaths, and is recommended by the Commissioners for revising and consolidating the criminal law. (See their Report on Penalties and Disabilities in regard to Religious Opinions, dated 30th of May, 1845.) The Commissioners also recommend that persons committing the two last-mentioned offences should no longer be adjudged and suffer as Quaker recusants convict, but should be punished in a more direct manner; and that one form of an oath, and one of an affirmation, should be substituted for the numerous forms of the oaths of allegiance, supremacy and abjuration, and the modifications thereof now existing, to be so framed that the same may be taken by all classes of her Majesty’s subjects without objection on religious grounds.

The whole of the law, written as well as unwritten, relating to the definition and punishment of the above offences, that is to say, the whole of Lord Chief Justice Hardwicke’s speech, generally, is comprised in twenty-four chapters and heads. 1. Preliminary Declarations and Enactments.

2. Treason and other offences against the State.
3. Offences against Religion and the Established Church.
4. Offences against Property and persons.
5. Offences against the Administration of Justice.
6. Offences against the Public Peace.
7. Offences relating to the Coin, and to Bullion, and Gold and Silver Plate.
8. Offences relating to the Public Property, Revenue and Funds.
10. Offences against Peace, War, and Necessary Prelates and Registers.
11. Offences against Public Morals and Decency.
15. Homicide and other offences against the person.
16. Libel.
17. Offences against the Habeas.
18. Fraudulent Appropriations.
19. Piracy and Offences connected with the Slave Trade.
20. Malicious Injuries to Property.
21. Forgery and other offences connected therewith.
22. Illegal Solicitations, Conspiracies, Attempts and Repetitions of Offences.
23. Definitions of Terms and Explanations.
24. Collection of evidence. Upon the subject of punishments, the Commissioners recommend the abolition of forfeiture as an incident to conviction for treason or felony; are inclined to reject whipping as a mode of punishment, except in the case of capital offenders, or of aiding fire-arms, &c. at the queen’s (5 & 6 Vict. c. 51, s. 2), in which it has lately been imposed by the legislature as constituting a signal mark of ignominy; propose that three, or at the utmost, four years should be the longest term of imprisonment to be inflicted for any offence, whether treason, felony, or misdemeanor, in cases where imprisonment forms the whole or part of the punishment; and suggest a scale of penalties, consisting of forty-five classes, to be substituted for the numerous punishments contained in the above statement. This scale might be much further reduced but for the special nature of some offences, and if the recommendations the Commissioners should be adopted. At present it is extremely difficult in some instances to determine what punishment an offence is liable to.

It may be expected that at no distant period the ‘Act of Crimes and Punishments,’ subject to such omissions as are recommended by the Commissioners, will become the law of the land. A bill embodying its provisions was introduced, at the end of the year 1844, in the House of Lords by Lord Brougham, was read a second time, and went into committee pro forma; but was ultimately withdrawn at the instance of the Lord Chancellor, who undertook to issue a commission for revising and consolidating the criminal law, and have a code of rules too laborious for any government to grapple with, and if their Report should be favourable to its adoption, to find one or more government measures upon it, as should be thought most expedient. A commission (the one most useful Report on Penalties and Disabilities in regard to Religious Opinions has been several times alluded to in the foregoing statement) was accordingly appointed for this, amongst other purposes, on the 22nd of February of the year 1845. Since, the members of the old commission (who also form part of the new one) have made a Report containing a digest of the law of procedure as regards indictable offences (a most difficult and laborious undertaking), and this also is to be revised by the new commission, and if passed into a law would be a work of inestimable value.

Besides the ‘Act of Crimes and Punishments’ and the Digest of the Law of Procedure, several other important reports emanated from the original Criminal Law Commission. It was upon their recommendation that the Acts of the 1st year of her present Majesty’s reign, repealing the punishment of death in cases between thirty and forty crimes, were founded. It was a Report of theirs which mainly contributed to the alteration of that harsh and inconsistent rule of our law which denied a prisoner his full defence by counsel unless he was charged upon a capital offence, and that engaged in the practice or administration of the law. The digestion so prepared by the Commissioners, and called by them ‘The Act of Crimes and Punishments,’ is comprised in twenty-four chapters and heads, namely:

1. Preliminary Declarations and Enactments.
2. Treason and other offences against the State.
3. Offences against Religion and the Established Church.
4. Offences against Property and persons.
5. Offences against the Administration of Justice.
6. Offences against the Public Peace.
7. Offences relating to the Coin, and to Bullion, and Gold and Silver Plate.
8. Offences relating to the Public Property, Revenue and Funds.
10. Offences against Peace, War, and Necessary Prelates and Registers.
11. Offences against Public Morals and Decency.
15. Homicide and other offences against the person.
16. Libel.
17. Offences against the Habeas.
18. Fraudulent Appropriations.
19. Piracy and Offences connected with the Slave Trade.
20. Malicious Injuries to Property.
21. Forgery and other offences connected therewith.
22. Illegal Solicitations, Conspiracies, Attempts and Repetitions of Offences.
23. Definitions of Terms and Explanations.
Providence.

Where any of the before-mentioned crimes has been or is suspected to have been committed, the ordinary mode of bringing the accused to justice is as follows:—Unless he surrender himself, he is, in the first place, to be summoned by some magistrate, having jurisdiction, to appear before him; or, as is sometimes ordered for his apprehension it is to be procured from some such magistrate. In the issuing of a summons or warrant there must be an information laid on oath: the former may be given either to the accused himself, or to some other person whom he orders to appear, the latter to any constable or other person whom the magistrate pleases, and must signify the party to be arrested and the offence for which complaint is made: until some warrant duly issued and served upon the accused, he is to appear according to its directions, or in default the magistrate may issue his warrant to apprehend him. After a warrant duly granted, where several summons have been previously issued or not, the person to whom it is directed is to proceed to arrest the accused (and if for treason, felony, or breach of the peace, may do so on any day, and at any time of the day or night), and to take him to goal or before some magistrate having jurisdiction, according to the import of the warrant, and that without any unnecessary delay. It is also lawful for a constable or private person who sees a felony committed, or attempted to be committed, to apprehend such a person or persons as he has reasonable cause to suspect to be the offender, without warrant; also any person whom he reasonably suspects of having committed a felony which has actually been committed, and persons found committing thefts or malicious injuries, without a warrant. The constable may also, without warrant, arrest on a reasonable charge made of a felony committed or dangerous wound given, although it afterwards appear that none such had been actually committed or given; also for a breach of the peace if committed in his view; but (except in the case of one of the metropolitan police, who may under certain circumstances do so upon a charge made of an aggravated assault [see 2 & 3 Vict. c. 47], not for committing such an assault), unless at the instance of the person aggrieved, without the presence of the sheriff, coroner, and all other peace officers, have, it would appear, the like power to arrest as constables. Where a party is arrested without warrant, he must be taken before a magistrate within a reasonable time.

On surrendering himself or appearing in obedience to a summons, or being brought before a justice of the peace under a warrant, the justice is to proceed to take the examination of the accused and the information on oath of those who know the facts and circumstances of the case, and is to put so much thereof as is material into writing. If a prindé face case be made out, the justice is to commit him to prison (unless he be excused to be discharged on his own recognizance, if it appear that no crime has been committed or that, if committed, the accused is innocent, he is to discharge him). Unless it be prohibited by act of parliament, the accused ought to be admitted to bail, and in the case of a charge of treason, felony, and the accused is brought before a single justice of the peace, if the evidence be neither sufficient to raise a strong presumption of guilt, nor to warrant the dismissal of the charge, he is to be detained until the case be taken before two justices at the least, who in such case may admit him to bail (7 Geo. IV. c. 64, s. 1), and, if one of them has signed the warrant of commitment, may admit him to bail, although he confessesthe matter laid to his charge, or such charge do not appear to be groundless, or the circumstances be such as to raise a presumption of guilt (3 & 6 Wm. IV. c. 33, s. 3). If the accused be brought before the justice in the first instance, they have the like power to bail him. Where a party is committed or bailed for any offence, the justice may bind by recognizance all persons who know or declare anything material touching it, to appear and felony is committed, or when he is to be brought before any justice or any court, must be examined upon the charge or before the trial, he is to be committed to the gaol of the Queen's Bench, or if in any other court or place, cannot be acquitted upon their trial, shall be discharged from imprisonment (31 Car. II. c. 2, s. 7). [I. H. 6. 5.: R. C.]

When the indictment is found, in cases of felony, the accused is bound to appear in court; such an appearance is to be brought to the bar and arraigned (which is legal term for calling on a prisoner to answer to a charge of an indictable offence). If not so conveniently served, the accused is not to be punished; but in all cases of treason, except where the overt act is the assassination of the queen, the endangering of her life or person, or any attempt to injure her person (39 & 40 Geo. III. c. 38; 5 & 6 Vict. c. 51), and except the forgery of the great and other royal seals (7 & 8 Wm. III. c. 3, s. 15), the accused is to have a true copy of the indictment delivered to him ten days at the least before he is arraigned, and, at the same time, a list of the witnesses is to be procured against him, and if indicted in any other court than the Queen's Bench, a list of the petit jury; but if indicted in the Queen's Bench, the list of the petit jury may be delivered to him at any time after his commitment. In the absence of the accused before the day of trial (7 & 8 Wm. III. c. 3, s. 1; 7 Anne, c. 21, s. 11; 6 Geo. IV. c. 50, s. 21). If the accused plead, however, without claiming or having had delivered to him such copy or list, the court shall be considered as not being his legal objection on account of such non-delivery. In cases of misdemeanor, the accused is not bound to plead and try at the session at which the indictment is found, unless he has been in gaol. In such case the accused may plead and try at the session before which he is charged, twenty days at the least, before such session (90 Geo. III. & 1 Geo. IV. c. 4, s. 3), but may traverse the indictment, that is, postpone its determination, and may, if not immediately, have the trial transferred to another court, to be allowed to do so, appear personally in court (except in the court which has jurisdiction to try parties for crimes by means of a petty jury; or in the case of murder or manslaughter, he may be tried upon the coroner's inquisition. Where the offence with which he is charged is treason, felony, or any criminal information filed against him in the name of the queen. For a præsumption, he is to be first indicted as in other cases, or may be proceeded against in the peculiar manner pointed out by 16 Rich. II. c. 5, commonly called the Statute of Pannunrime. This latter mode may, however, be regarded as obsolete.

A bill of indictment is a bill of indictment of the Crown, and being for the public benefit and security, may generally be preferred by any person; but it is not usual for parties to interfere unless they have seriously aggrieved by the offence, or fill some office which renders it peculiarly incumbent on them to bring the offender to justice. [INDICTMENT, P. C.] So soon as the grand jury have presented the bill of indictment in court, issued 'a true bill,' the indictment is complete. If the grand jury find no true bill, the accused, where in custody, is to be at once set at large, without the payment of any fees on account of such discharge (14 Geo. III. c. 20; 55 Geo. III. c. 50; 8 & 9 Vict. c. 114). An indictment may also be framed upon the presentment by a grand jury, of their own knowledge that an offence has been committed; but this mode of prosecution is seldom adopted. For further particulars relating to Grand Juries see the title. A criminal information in the name of the Queen is a suggestion filed on record by the attorney-general or by the queen's counsel or master of the Crown Office, in the court of the Queen's Bench, but to a misdemeanor in the name of an alleged offender. The attorney-general, or, during vacancy in that office, the solicitor-general, may at discretion file a criminal information. In all other cases it is in the discretion of the court of the Queen's Bench to grant or refuse leave to file such informations, and such leave will only be granted on motion made, grounded on proper affidavits, and in respect of misdemeanors of such magnitude or under such circumstances as, in the opinion of the court, call for the inter- stance. After an information is filed, all the subsequent proceedings are, in general, the same as after an indictment found for a misdemeanor.

Persons committed for treason or felony who move in open court the first week of the term, or first day of the sessions of oyer and terminer or gaol delivery, to be brought to trial, may, if not indicted some time in the next term or session after their commitment, be bailed by the judges of the Queen's Bench, or justices of oyer and terminer or goal delivery, unless it appear that the witnesses for the crown could not be produced the same term or sessions; and if not indicted and tried the second time, if after the time ordered by the law acquitted upon their trial, shall be discharged from imprisonment (31 Car. II. c. 2, s. 7). [I. H. 6. 5.: R. C.]

When the indictment is found, in cases of felony, the accused is bound to appear in court; such an appearance is to be brought to the bar and arraigned (which is legal term for calling on a prisoner to answer to a charge of an indictable offence). If not so conveniently served, the accused is not to be punished; but in all cases of treason, except where the overt act is the assassination of the queen, the endangering of her life or person, or any attempt to injure her person (39 & 40 Geo. III. c. 38; 5 & 6 Vict. c. 51), and except the forgery of the great and other royal seals (7 & 8 Wm. III. c. 3, s. 15), the accused is to have a true copy of the indictment delivered to him ten days at the least before he is arraigned, and, at the same time, a list of the witnesses is to be procured against him, and if indicted in any other court than the Queen's Bench, a list of the petit jury; but if indicted in the Queen's Bench, the list of the petit jury may be delivered to him at any time after his commitment. In the absence of the accused before the day of trial (7 & 8 Wm. III. c. 3, s. 1; 7 Anne, c. 21, s. 11; 6 Geo. IV. c. 50, s. 21). If the accused plead, however, without claiming or having had delivered to him such copy or list, the court shall be considered as not being his legal objection on account of such non-delivery. In cases of misdemeanor, the accused is not bound to plead and try at the session at which the indictment is found, unless he has been in gaol. In such case the accused may plead and try at the session before which he is charged, twenty days at the least, before such session (90 Geo. III. & 1 Geo. IV. c. 4, s. 3), but may traverse the indictment, that is, postpone its determination, and may, if not immediately, have the trial transferred to another court, to be allowed to do so, appear personally in court (except in the
Queen's Bench, where he may appear by attorney) and plead. A party indicted for a misdemeanour, not having been in custody nor out on bail, twenty days before the session at which he is so indicted, may also, at the subsequent session, traverse to the one following, unless he has been in custody or otherwise notified of such indictment, twenty days before such subsequent session (60 Geo. III. & 1 Geo. IV. c. 4, s. 5). If the accused, whether in case of felony or misdemeanour, be not in custody nor on bail when the indictment is found, the court may not on bail, make default, his appearance may be compelled by process or by a bench warrant; and he may be prosecuted to outlawry. [OUTLAWRY, P. C.] No fee is to be demanded or taken from persons charged in such a case, except by messengers as to a party acquitted, or, on an order such finding to be recorded and the prisoner to be kept in strict custody until her Majesty's pleasure be known.

When, however, the plea of 'Not Guilty' has been pleaded, the trial is to be had before some court having jurisdiction, in which the felony or misdemeanour is alleged to have been committed. If the fact is alleged in the indictment to have been committed, called a petit jury, by way of distinction from the grand jury. The ordinary courts having jurisdiction to try indictable offences are the Queen's Bench Courts of Oyer and Terminer, Goal Delivery, and Quarter-Sessions, Borough Courts and the superior Criminal Courts of the Counties Palatine; but Courts of Quarter-Sessions and Borough Courts have no jurisdiction with respect to indictable offences punishable with death or transportation for life, and several other offences (see § 5 & 6 Vict. c. 38, s. 1). The trial is generally to be had in the county or district in which the offence was committed.

Upon the trial being called on, the jurors are to be sworn as they appear, to the number of twelve, unless they be challenged. As to challenges, whether on the part of the Crown or the prisoner, and as to petit jurors generally, see JURY, P. C. It may here be observed, however, that the right of preperemptory challenge, i. e. of challenging at mere pleasure, without showing any cause, which exists in cases of treason or felony, has not been allowed in cases of misdemeanour, to distinguish those classes of crimes from misdemeanours; and that the power to challenge peremptorily to the number of thirty-five jurors in cases of treason, and to the number of twenty in cases of felony, is allowed in cases of treason and feoly, but not with respect to misdemeanours. When twelve jurors are procured from exception, and have been sworn, or, if Quakers, Moravians, or Separatists, or persons who have been impeached of perjury, declared that they will give no verdict in case of treason or felony, well and truly to try and true deliverance make between the queen and the prisoner whom they have in charge, and, in cases of misdemeanour, well and truly to try the issue between the defendant, the case, where counsel is retained for the prosecution, is to be opened by him, or, if two or more counsel are retained, by the leading one, according to his instructions, and then the prisoner is to be called as a witness. If the counsel for the prosecution ought, however, to confine himself so far as possible, to a simple statement of the facts which he expects to prove, and to abstain from any appeal to the passions of the jury, more particularly in cases where the prisoner has no counsel. After the opening, or where no counsel is engaged for the prosecution, immediately after the swearing of the jury, the examination of the witnesses on behalf of the Crown commences. Before being examined an oath or affirmation is administered to each witness that he will true answer to such questions as the court shall demand of him, and will tell the truth, the whole truth, and nothing but the truth. Witnesses are not allowed in the case of the witnesses; where there is none, that duty devolves on the court. In criminal cases a single witness, swearing to the actual offence or to such facts as necessarily lead to the discovery of that offence, is often enough. But sometimes there has been on the part of the prosecution an insufficiency of the evidence, or it is generally sufficient to substantiate the charge. In treason, perjury, and the offences of tumultuously petitioning, affirming that parliament has a legislative authority without the Crown, or that any person is entitled to the crown contrary to the Act of Settlement, and Blasphemy under the provisions of 9 & 10 Wm. III. c. 32, however, there must be two witnesses. In all cases also, the prisoner's confession, if made in consequence of a charge against him, and in a direct and positive manner, voluntarily and without promise or threat operating on his mind at the time of making it, is sufficient; even if there be no other proof that the crime with which he has been charged has been committed, for the jury to convict upon, if they believe it to be true. And the single unsupported testimony of an accomplice is sufficient (except where two witnesses are required), if the jury believe his story; but it is usual in such cases for the court to direct a jury to be returned to the court. If, however, the accomplice be corroborated by unsuspicious evidence as to such parts of his testimony as show that his story has not been fabricated, the court will not interfere. There may be exceptions to the rule that the charges may be sustained: 1st, positive, as by the direct testimony of a witness who saw the fact; 2ndly, circumstantial, when a number of facts are presented which are inconsistent with any other hypothesis than that of the accused being the person implicated for the purpose under the provisions of the 39 & 40 Geo. III. c. 94, so that he cannot be tried, the court may
When the jury have agreed upon their verdict, they signify that they are ready to deliver it; and on returning into court by the purpose, their names must be called over, and all twelve must be heard before it is given. The dispensation of the jury is the person who is to deliver the verdict; and in cases of treason or felony, it can only be received in open court; and in cases of misdemeanor, it may be otherwise. The verdict in such cases may be either 'Guilty' or 'Not Guilty,' or may be a special one; and may be 'Guilty' upon one count of an indictment, and 'Not Guilty' upon another. Guilty upon one count, and 'Not Guilty' as to the remainder, where an offence is charged which includes a lesser crime of the same degree, and the latter only is proved; as where murder is charged, and the evidence of manslaughter by the passing of 7 Wm. IV. & 1 Vict. c. 85, s. 11, before referred to, the jury may find guilty of an assault, where one is included in the felony charged, and acquit of the felony, although an assault is a misdemeanor only. A special verdict is the finding of all the facts specially, where the jury doubt whether they constitute the offence in the indictment, and leaves the court to give judgment according to the legal effect of the facts so found.

Where upon the trial evidence is given of insanity at the time of committing the offence charged, and the jury acquit, they are required to find specially whether the accused was insane at the time of committing the offence, or whether he was acquainted on that account; and if they find in the affirmative, the court is to order him to be detained till the queen's pleasure be known; and she may give such order as she sees fit in cases of insanity. (39 & 40 Geo. III. c. 94, s. 1; & 2 & 4 Vict. c. 54, s. 3.) On a verdict of acquittal, or where he is discharged by proclamation for want of prosecution, the prisoner is to be immediately set at large in open court, and the officer of the court, in respect of such discharge. (14 Geo. III. c. 20; 55 Geo. III. c. 50; & 8 & 9 Vict. c. 114.)

When a verdict of guilty has been restored against a prisoner, the court, except in the case of prosecutions pending in the Queen's Bench, may proceed at once to pass sentence upon him, unless he allege some matter or thing sufficient in law to arrest or bar his judgment. In prosecutions pending in the Queen's Bench, the prisoner is allowed four days for moving in arrest of judgment; or, in cases of misdemeanor, for a new trial or writ of certiorari facias de novo. Also where the trial at any sittings or assizes is upon a record of the Queen's Bench, the judge before whom the verdict is taken may, under 11 Geo. IV. & 1 Wm. IV. c. 70, s. 9 (except where the prosecution is by Information filed by leave of the Queen's Bench), or by the attorney-general wherein he prays that judgment may be postponed, pass sentence at once; but such sentence is not to have the force and effect of a judgment of that court, until after the expiration of the term in which the proceeding is pending, or after the ensuing term, during which period the prisoner may move for a new trial, or to have the judgment amended. Except in the last-mentioned case of a trial at the sittings or assizes upon a record of the Queen's Bench, or where the Queen's Bench is at nisi prius, the prisoner is convicted is a misdemeanor punishable by a simple fine, or where the Queen's Bench, after conviction for misdemeanor, thinks proper to dispense with his attendance, sentence cannot be pronounced against a prisoner unless he be present in court at the time. Judgment may be arrested where the offender has received a pardon since his arraignment or after conviction becomes insane, or, having been out of custody since his conviction, denies that he is the person convicted (in which last case a jury is generally impaneled to try the fact), or for some defect apparent in any part of the record, as regards either the jurisdiction or the constitution of the court or proceedings thereon, but not for any of the mere technical defects specified in 7 Geo. IV. c. 64, ss. 20 and 21. If the judgment be arrested, all the proceedings against him are to be held in abeyance; and if the court, after an inquiry into the facts, be of opinion that the defendant is insane, or if the proceedings be arrested on any other ground, the defendant is to be committed, and the judge is to pronounce in his favour; but he may be prosecuted again for the offence of which he is so acquitted.

A new trial may be ordered upon the application of the defendant in all cases of misdemeanor pending in the Queen's Bench, where it appears to the court that the awarding one is essential to justice; as, for instance, where the verdict is contrary to the evidence or the directions of the judge; where it has been improperly received or rejected at the trial. The court of Queen's Bench will also in its discretion, where a party is
acquitted of a misdemeanor on a prosecution pending in that court, allow a new trial, on the application of the prosecutor, if such acquittal has been obtained by any fraudulent means of his choice, where the party acquit has kept back any of the prosecutor's witnesses, or neglected to give due notice of trial.

A writ of venire facias de novo, the effect of which is the same as in a new trial, may be awarded where, by reason of misconduct on the part of the jury, or of some uncertainty or ambiguity or other imperfection in their verdict, or of any other irregularity or defect in the proceedings or the appealing on the record, the proper effect of the first venire has been frustrated, or the verdict has become void in law.

Neither new trials nor writs of venire facias de novo are grantable in cases of treason or felony.

Where a new trial or writ of venire facias de novo is awarded, the parties stand in the state in which they were immediately before the first trial: the whole case is to be re-heard, and the first verdict cannot be used upon the new trial, or as evidence of any matter found by such verdict, or in argument.

After sentence pronounced against an offender, the judgment of the court may be falsified or reversed, either by plea without writ of error or by writ of error: by the former, for some matter not apparent upon the face of the record, as want of authority in the court by whom the judgment was pronounced; or for some matter not appearing on the record, the proper effect of the judgment itself. Where the judgment has been pronounced by a court of oyer and terminer, gaol delivery, or quarter sessions, or of a county court, the writ of error is to be brought in the court of Queen's Bench, and for that purpose the indictment and other proceedings thereon must be removed into that court by writ of certiorari [CERTIORARI, F. C. 1. c. 3. s. 1.]; where it has been pronounced by any other court, it is to be brought in the Exchequer Chamber, before the justices of the Common Pleas and barons of the Exchequer, from whose judgment a writ of error lies to the court of Queen's Bench.

In cases of treason and attending is the discretion of the crown to grant or refuse a writ of error: in all other cases the right of the attorney-general must be first obtained, and this he ought to grant upon probable cause of error shown. When issued, the writ of error stays the execution of the judgment, where it has not been carried into effect during the time that such writ is pending, except that in cases of treason or felony the offender is not entitled to be liberated on bail. In cases of misdemeanor, however, where he is imprisoned under execution, or any fine has been levied, either in whole or in part in pursuance of the judgment, he is entitled to be discharged from imprisonment and to receive back any money levied, or the amount of a determination of the Writ of Error. (8 & 9 Vict. c. 68, s. 1.)

If the judgment be falsified or reversed, such judgment and the fine or pecuniary punishment, and all former proceedings, become thereby absolutely null and void. A judgment against whom is so falsified or reversed, if living, and, if dead, his heir or executor, is restored to all things which such person may have lost by such judgment and other proceedings, and stands in every respect as if such person had never been charged with the offence in respect of which such judgment was pronounced against him. If, however, the execution only be erroneous, that only will be reversed; and if the judgment be reversed for some technical error merely, in the indictment or subsequent process, the party may be prosecuted again. If the judgment be confirmed, the prisoner is to undergo the remaining punishment.

Where there is nothing to arrest or bar a judgment, the execution of it may be prevented by a pardon received after sentence pronounced; but, without express words of resituation, such a pardon, unless it be put in his court or the execution or attinder, is thereby revoked in him; nor, unless where the pardon is by act of parliament, is the corruption of his blood removed, except as regards those of his blood born after the time such pardon, or the consequences of such previous corruption prevented.

In capital cases the execution of a judgment may also be suspended by a reprieve, either at the discretion of the Crown, or by the order of the courts of justice requires it. There are two instances however in which the court is bound to grant a reprieve, viz: 1, where the offender, if a female, is pregnant; 2, where the offender becomes insane after judgment.

The prisoner alleges that she is pregnant or the court have reason to suppose that she is so, a jury of twelve matrons is to be impannelled with all possible dispatch to try whether or not she be quick with child. In case they find in the evidence that the prisoner has kept back any of the prosecutor's witnesses, or neglected to give due notice of trial.

A writ of venire facias de novo, the effect of which is the same as in a new trial, may be awarded where, by reason of misconduct on the part of the jury, or of some uncertainty or ambiguity or other imperfection in their verdict, or of any other irregularity or defect in the proceedings or the appealing on the record, the proper effect of the first venire has been frustrated, or the verdict has become void in law.

Neither new trials nor writs of venire facias de novo are grantable in cases of treason or felony.

Where a new trial or writ of venire facias de novo is awarded, the parties stand in the state in which they were immediately before the first trial: the whole case is to be re-heard, and the first verdict cannot be used upon the new trial, or as evidence of any matter found by such verdict, or in argument.

After sentence pronounced against an offender, the judgment of the court may be falsified or reversed, either by plea without writ of error or by writ of error: by the former, for some matter not apparent upon the face of the record, as want of authority in the court by whom the judgment was pronounced; or for some matter not appearing on the record, the proper effect of the judgment itself. Where the judgment has been pronounced by a court of oyer and terminer, gaol delivery, or quarter sessions, or of a county court, the writ of error is to be brought in the court of Queen's Bench, and for that purpose the indictment and other proceedings thereon must be removed into that court by writ of certiorari [CERTIORARI, F. C. 1. c. 3. s. 1.]; where it has been pronounced by any other court, it is to be brought in the Exchequer Chamber, before the justices of the Common Pleas and barons of the Exchequer, from whose judgment a writ of error lies to the court of Queen's Bench.

In cases of treason and attending is the discretion of the crown to grant or refuse a writ of error: in all other cases the right of the attorney-general must be first obtained, and this he ought to grant upon probable cause of error shown. When issued, the writ of error stays the execution of the judgment, where it has not been carried into effect during the time that such writ is pending, except that in cases of treason or felony the offender is not entitled to be liberated on bail. In cases of misdemeanor, however, where he is imprisoned under execution, or any fine has been levied, either in whole or in part in pursuance of the judgment, he is entitled to be discharged from imprisonment and to receive back any money levied, or the amount of a determination of the Writ of Error. (8 & 9 Vict. c. 68, s. 1.)

If the judgment be falsified or reversed, such judgment and the fine or pecuniary punishment, and all former proceedings, become thereby absolutely null and void. A judgment against whom is so falsified or reversed, if living, and, if dead, his heir or executor, is restored to all things which such person may have lost by such judgment and other proceedings, and stands in every respect as if such person had never been charged with the offence in respect of which such judgment was pronounced against him. If, however, the execution only be erroneous, that only will be reversed; and if the judgment be reversed for some technical error merely, in the indictment or subsequent process, the party may be prosecuted again. If the judgment be confirmed, the prisoner is to undergo the remaining punishment.

Where there is nothing to arrest or bar a judgment, the execution of it may be prevented by a pardon received after sentence pronounced; but, without express words of resituation, such a pardon, unless it be put in his court or the execution or attinder, is thereby revoked in him; nor, unless where the pardon is by act of parliament, is the corruption of his blood removed, except as regards those of his blood born after the time such pardon, or the consequences of such previous corruption prevented.

In capital cases the execution of a judgment may also be suspended by a reprieve, either at the discretion of the Crown, or by the order of the courts of justice requires it. There are two instances however in which the court is bound to grant a reprieve, viz: 1, where the offender, if a female, is pregnant; 2, where the offender becomes insane after judgment.

The prisoner alleges that she is pregnant or the court have reason to suppose that she is so, a jury of twelve matrons is to be impannelled with all possible dispatch to try whether or not she be quick with child. In case they find in the evidence that the prisoner has kept back any of the prosecutor's witnesses, or neglected to give due notice of trial.
observed, be put upon his trial until a true bill has been found against him by a grand jury, and cannot be convicted except by the verdict of a petit jury: to have made all these minute offences punishable by indictment upon the class of persons qualified to serve as jurors a frequency of attendance which would have been found to be most troublesome and harassing. Accordingly numerous acts of parliaments of the peace or persons the power to try parties accused of trifling offenses without the intervention of a jury. The extension of the mode of proceeding has been always regarded with extreme jealousy.

Where an offence punishable on summary conviction before a justice of the peace has been committed, or is suspected to have been committed, the attendance of a jury is dispensed with as follows:—An information (but which need not be in writing unless directed to be so by the statute which creates the offence) is to be laid before the justice authorized to take such information, who thereupon issues a summons to the party complained of, containing the substance of the charge, and giving him notice that at a certain time and place the hearing of the complaint against him will be proceeded with. If the party attend at the appointed time and place, and confess that he has committed the offence, the justice proceeds at once to convict him, and to impose the penalty assigned by the Act which creates the particular offence. If he attend, but deny the commission of the offence, the party in whose favour the evidence is to be gone into for the purpose of showing that he has committed it. In the latter case, however, it must be first ascertained that he has been duly summoned. It appears that in this recent legislation, all such cases are in the presence of the party complained of, where he appears; and generally, all rules applicable to the trial of indictable crimes must be considered as applied to the trial of offences punishable on summary conviction, so far as such rules are capable of being brought with that mode of proceeding. If, after hearing the evidence, the justice is of opinion that the charge is not substantiated, the party accused is to be acquitted. If, on the other hand, he thinks that it is, he is to convict the offender and to impose upon him the assigned penalty. Upon conviction the justice usually issues his warrant to apprehend the offender, in cases where corporal punishment is to be inflicted upon him, or else to levy the penalty incurred, by distress and sale of his goods. This is the general mode of proceeding, as well where the conviction is required to be before two or more justices, as where it may be before a single justice of the peace; but for particulars recourse must be had to the several statutes creating the offences or inflicting the punishment. In some cases a power of appealing to the quarter-sessions is given to the party aggrieved. But the mission of the justice in the subject is as follows:—The principal authorities besides the statutes of the realm which have been consulted in the preparation of this article, are Hawkins's Pleas of the Crown; Blackstone's Commentaries; Russell, On Crimes and Misdemeanors; Chitty's Criminal Law; Starkie's Treatise On the Law of Evidence and On Criminal Pleading; Dickerson's Guide to the Quarter-Sessions, by Talfourd; the 4th, 5th, 6th, 7th, and 8th Reports of the Criminal Cases; Commissioners: The Records of the Commissioners for revising and consolidating the Criminal Law, on the subject of Penalties and Disabilities in regard to Religious Opinions; and Hulton On the Law of Conveyance.

LEASE. A lease, or letting, is sometimes called a Demise (denisiis). It is sometimes said that Lease is from the Latin locatio, but as the verb which corresponds to the noun Location, the word Lease, in certain cases, is entailed upon the verb Let. The verb Let is akin to the French laisser and the German lassen.

He who lets land is called the Lessor, and he who to whom land is let is called the Lessee.

There are various legal definitions of a lease. A lease has been defined as a conveyance of lands or tenements from lessee to lessee for life, or for years, or at will, generally in consideration of a rent or reversionary interest. A lease is generally spoken of as a conveyance from one individual to another, without the consent of a particular lessor, and the lease is said to arise by a contract between the lessee and the lessee. The reservation of a rent is not essential in a lease; but payment of rent is now the chief condition on which lands are let.

To constitute a lease, it is necessary that the lands must be let for a less time than the period for which the lessor has an interest in the lands demised. If a man parts with all his interest in the lands or tenements, the conveyance is an assignment [Amendment, P. C.], and not a lease. The relation of lease from one lessor to another lessor of the same lands is usually expressed by the phrase landlord and tenant. The lessor has a reversion in the lands which are demised, that is, the expiration of the time for which the land remains his. The lessee, by virtue of this reversion, signory, or lord's title, has the power of distraining on the land for the rent which is agreed on, and for the services which may be due by the terms of the lease, and failure of payment of rent is a breach of the lease. [EsKULL, P. C.] The ordinary lease is that for a term of years, by which lease a rent, generally payable in money, at stated times, is reserved to the lessor. These stated times are usually quarterly periods.

The words used in a lease for the purpose of conveying that interest in the lands which constitutes a term of years are 'dimess, grant, and to farm.' These words are derived from the law-Latin expression 'demiiss, concessi, et ad firmam tradidi.' The word 'firma, farm, is said to signify originally 'provisions,' and 'to farm let' does not properly signify to let to be farmed, in the modern sense of the term, but to let on the condition that the tenant has certain leases of an annual or ordinary farm, that is, in provisions. If this explanation is correct, a 'farmer' is one who had the use of lands on condition of paying a 'farm' or rent in provisions, such as corn and beasts. But the word 'farmer' signifies another person, which a man hires to cultivate upon the payment of a rent.

The interest which a man acquires in land by a lease for years is a term of years, or an estate for years. [Estate, P. C.] The word lease is used in common language also to signify the estate or interest which the lessee acquires by the lease; but the word lease signifies properly the contract or conveyance by which the lessee acquires the interest in the lands.

The words 'demeis, &c., above mentioned, are the proper words to constitute a lease for years: but any words are sufficient, which clearly show the intention of the parties that the one shall divest himself of the possession of the land, and the other come into it for a determinate time.' When the written contract is not intended to be a lease, but an agreement for a future lease, it is often difficult to determine whether the contract is not so expressed as to make it a lease.

At common law, it was necessary for the lessor to enter on the lands in order to make the lease complete, and no writing was necessary. But the Statute of Frauds (20 Car. II. c. 3, § 1) enacted, that all leases, estates, interests, of freehold or terms of years, created by livery and seisin [Easomment, P. C.] only, or livery in possession and not in fee, should be in writing, and shall be enforceable only by the party making the same or their assigns, or by the parties so making the same or their agents thereunto lawfully authorized by writing, shall have the force and effect of leases or estates at will only, except leases not exceeding the term of three years from the making thereof, in which the rent reserved to the landlord during such term shall amount to two-thirds at the least of the full and improved value of the thing demised. A deed is not necessary to constitute the writing a lease, unless the tenement is an incorporeal hereditament or a reversion or remainder. But leases are generally made by deed, because covenants can be made only by deed. [Dexter, P. C.] The word 'lands,' which refers to the subject matter of a lease, comprehends what is upon the lands, as houses and other buildings, though houses and buildings are generally mentioned specifically in the lease.

The law of leases extends a great number of rules, which may be conveniently reduced to the following general heads:
tain, in order that the lease may be most beneficial to the landlord and the tenant, and by consequence to the public generally.

The subjects of leases are houses and buildings of all kinds, cultivable lands, and mines. Many persons who have not the complete ownership of houses and lands are enabled to grant leases under particular powers; and there are many statutes and in particular clauses of leases are either restrained or restricted to the granting of leases, such as Bishops, Deans and Chapters, and others. [Beveridge, P. C.]

The kind of leases of which we shall treat here are farming leases, which grant to the farmers the right to cultivate the land, and to have full power to grant them on such terms as they please. The particular form of such leases, as already intimated, is a matter that belongs to the subject of public economy, and it is almost beyond the province of direct legislation to make improvements in that mode, there would be a fresh capital applied to the cultivation of the land, with all the improvements of modern husbandry. It is contrary to experience and to all reason to suppose that a good farmer will apply his skill and capital to improvement of another man's property, unless he has the security that he will be renumerated.

The improvements which would follow from a good system of leasing would be the abolition of the evils which now exist in consequence of uncertain tenure and of bad leases. It is affirmed by the best authorities that the amount of capital which is now applied to the cultivation of the land in England is much less than it was, and that it is not sufficient capital to improve their lands, nor the necessary skill and enterprise; and it is maintained that these evils are mainly owing to the want of a sufficient security of tenure or the want of the power in the lessor to enforce, to the usual restrictions with which many of them abound.

It has been said, and truly enough, that there is no advantage to the landlord in granting a lease to bad cultivators, and that there are many such. Such a lease would not indeed be of any advantage to the farmer himself or the community in general; but he who has land to let, and will let it on terms that are mutually profitable to the landlord and the tenant, will be much more likely to get a tenant of skill and capital than he who gives the farmer an uncertain tenure or binds him in the fetters of a bad lease.

The preservation of the game and the enjoyment of the pleasures of the chase, or of the profits derived from the wild animals, is another object which some landlords secure by their lease with as much minuteness and strictness as they do their rent. [Game Laws, P. C. S.]

Thus, in addition to getting a rent from his land, the landlord often wishes to command the votes of his tenant and secure his game. With reference to these objects and certain other imaginary advantages, which are produced by directing mode of cultivation, he has a lease drawn up with conditions upon restrictions, penalties, and feudal services, which no care on the part of the farmer can prevent him from breaking in some part, and which particularly prevents the landlord from being able to enforce the best and most uncontrived feeling would consent to sign. Specimens of such leases have been printed and circulated. One of them appeared in the 'Leicester Chronicle' for June 28, 1845. This lease is a specimen of the kind which is absolutely inconsistent with good farming. The landlord in such a lease directs the tenant how he must cultivate the land. If the directions which the landlord gives comprehended the best modes of cultivation, they would be unnecessary if he had a good tenant, and they would not be observed by a bad one. A good tenant with sufficient capital will farm the land according to the system best adapted for the land, and he will be ready to avail himself of improvements. A good tenant, whether he has capital or not, will not farm well simply because he is prevented from doing some things and bound to do others; for farming, like other matters, consists not only in doing well what it is lawful to do, but in doing it well, even if the law restricts, if enforced at all, can only be enforced by constant supervision, and must be an endless source of trouble and dispute.

But most farming leases are often copies of old leases, made in other days, and are unsuited to the present state of agriculture. The things which they require not to be done and those which they require to be done, are often inconsistent. The farmer often depends on having a certain piece of land to cultivate, out of which he may be turned on a short notice, will not be an independent voter. Nor can the landlord expect to have a good tenant who will improve his land and a political tool at the same time. The uncertainty of the tenure will prevent a man of skill and capital from investing his money upon so uncertain a return. There may be many cases in which the personal character of the landlord and his promise to guarantee to his tenants that his property will not be disturbed in the possession of the land, even where he has no proper lease, so long as he cultivates it fairly and pays his rent.

But the most intelligent landlords themselves admit that the only proper tenure of the tenant is that of a lease for a determinate period; and it is on this condition alone as a general rule, that a landlord can get men of capital and skill and induce them to cultivate the land. Leases of this kind, which are unanswerable, that if lands were let to farmer tenants on leases for a determinate number of years, and on conditions which should not interfere with the land being cultivated in the best mode, there would be a fresh capital applied to the cultivation of the land, with all the improvements of modern husbandry. It is contrary to experience and to all reason to suppose that a good farmer will apply his skill and capital to improvement of another man's property, unless he has the security that he will be renumerated.

The improvements which would follow from a good system of leasing would be the abolition of the evils which now exist in consequence of uncertain tenure and of bad leases. It is affirmed by the best authorities that the amount of capital which is now applied to the cultivation of the land in England is much less than it was, and that it is not sufficient capital to improve their lands, nor the necessary skill and enterprise; and it is maintained that these evils are mainly owing to the want of a sufficient security of tenure or the want of the power in the lessor to enforce, to the usual restrictions with which many of them abound.

It has been said, and truly enough, that there is no advantage to the landlord in granting a lease to bad cultivators, and that there are many such. Such a lease would not indeed be of any advantage to the farmer himself or the community in general; but he who has land to let, and will let it on terms that are mutually profitable to the landlord and the tenant, will be much more likely to get a tenant of skill and capital than he who gives the farmer an uncertain tenure or binds him in the fetters of a bad lease.

The preservation of the game and the enjoyment of the pleasures of the chase, or of the profits derived from the wild animals, is another object which some landlords secure by their lease with as much minuteness and strictness as they do their rent. [Game Laws, P. C. S.]

Thus, in addition to getting a rent from his land, the landlord often wishes to command the votes of his tenant and secure his game. With reference to these objects and certain other imaginary advantages, which are produced by directing mode of cultivation, he has a lease drawn up with conditions upon restrictions, penalties, and feudal services, which no care on the part of the farmer can prevent him from breaking in some part, and which particularly prevents the landlord from being able to enforce the best and most uncontrived feeling would consent to sign. Specimens of such leases have been printed and circulated. One of them appeared in the 'Leicester Chronicle' for June 28, 1845. This lease is a specimen of the kind which is absolutely inconsistent with good farming. The landlord in such a lease directs the tenant how he must cultivate the land. If the directions which the landlord gives comprehended the best modes of cultivation, they would be unnecessary if he had a good tenant, and they would not be observed by a bad one. A good tenant with sufficient capital will farm the land according to the system best adapted for the land, and he will be ready to avail himself of improvements. A good tenant, whether he has capital or not, will not farm well simply because he is prevented from doing some things and bound to do others; for farming, like other matters, consists not only in doing well what it is lawful to do, but in doing it well, even if the law restric
interest is one of the reasons why many of these absurd leases still exist.

There can be no principle in the letting of land, if the object is simply to secure the best rent to the landlord and the permanent improvement of the land, his different interests in the farming of any other piece of property. The good farmer hires land to cultivate, with the hope of deriving profit from the application of his skill and capital. He does not want the tenant to be a rival farmer, but a race of farmers whose interest it is to turn the land to his own advantage. The first object of the landlord is to get as much rent as his land is worth, and to secure its against deterioration during the tenant’s occupation. The terms of the lease, then, must be so framed that, in the interests of the landowner, the observance of such conditions as are found by experience and known to practical agriculturists to be necessary to secure the permanent value of the landlord’s land. It is admitted by all reasonable people that the landlord should have ample security by the lease for his land being given up to him at the end of the lease in as good condition as he gave it to the tenant. The tenant wants no directions from the landlord, and no conditions in his favour, beyond the simplest conditions of being allowed to cultivate the land in the best way that he can for his own profit during a period sufficiently long to secure him a return for his outlay, and he acknowledges that he has no right to demand, or to insist that the landlord, if they insist on many conditions as necessary to secure their permanent interest, which a good farmer would object to as not necessary for that purpose, and also as inconsistent with the system of farming. If the framing of such a lease as we have described in general terms, must be the joint work of intelligent and liberal landlords and of good tenant farmers. It may require some time, some more experience, and suggestions from many quarters before such a lease is got into the best form. But it is an object which the consideration of all persons interested in the cultivation of the land, and the attempt has been made already. We have seen, in the Vale of Evesham Agricultural Association, which has been circulated for the purpose of obtaining the suggestions of competent persons.

It has been said that some farmers do not care for having long leases; they are willing to go on as they have done. But can it be shown that there is a number of intelligent farmers with capital who prefer a yearly tenure to a lease of reasonable length? Besides, some of these agreements for a tenancy from year to year contain restrictions almost as numerous and absurd as those in leases for a term of years. If the farmer is not to permit the farmyard manure and so increase his crop of corn, he would ask the farmer for buying them where he could get them cheapest, in order that he might have a greater return for his outlay, and this at the same time, without an increasing crop of manure, which is the result of a fair contract between farmer and landlord, these are not the men to improve our agriculture; these are the men with little capital, and less skill, who are the chiefstay of the easy temper and good nature of an indulgent landlord, and are taught that they and their labour must be protected from foreign competition. The intelligent farmer with capital seeks no protection against the foreigner, and wants no indulgence from his landlord. He is ready to give, and he would be compelled by competition to give, to the landlord the full value for the use of his land, and he would ask for no more than the liberty of cultivating it in the best way.

Before, however, a good farmer could enter on the land with full confidence, he would have one favour to ask of his landlord; and that would be, not to protect him. If he were to provide for an expense of he would be compelled by competition to give, to the landlord the full value for the use of his land, and he would ask for no more than the liberty of cultivating it in the best way.

In 1845 an act was passed (8 & 9 Vict. c. 194) entitled ‘An Act to facilitate the Granting of certain Leases.’ Its object is to substitute abbreviated forms for those now in use, and it is provided that in taxing any bill for preparing and executing any deed under the act, the taxing officer, in estimating the proper amount to be charged as the tax on the length of such deed, but only the skill and labour employed, and the responsibility incurred in the preparation thereof. It is enacted in section 4, ‘That any deed or part of a deed which shall fail to produce the effect by virtue of this act, shall nonetheless be as valid and effectual, and shall bind the parties thereto, so far as the rules of law and equity will permit, as if this act had not been made.’ There are schedules to the act,
LEA

one of which gives, in column 1, short forms of expression which may be used in place of the ordinary expressions in leases, which are contained in column 2; and it is enacted by section 1, 'That whenever any party to any deed made according to the said schedule of the act, or to any other deed which shall be expressed to be made in pursuance of this act, shall employ in such deed respectively any of the words contained in column 1 of the said schedule, as agreed, or so far as may be put in accordance by any number therein, such deed shall be taken to have the same effect and be construed as if such party had inserted in such deed the form of words contained in column 2 of the same schedule, as if the same had been inserted in that form of words employed by such party; but it shall not be necessary in any such deed to insert any such number.' 

This act does not extend to Scotland. The amount of words saved by this act is not sufficient to compensate for the difficulties that may arise from persons using the abbreviated forms in cases where they may not intend them to have the full meaning which this act gives to them. He who wishes to guard himself either as landlord or tenant by suitable covenants will do better to express his meaning at full length, without availing himself of the abbreviated forms which this act invites him to use.

Legal terms require either an ad valorem stamp or the common deed stamp, without which the instrument cannot be given in evidence. Leases for a term determinable on a life or lives not exceeding three, and the leases of all ecclesiastical corporations, whether aggregating or not, for any term not exceeding twenty-one years, are exempted from the duty.

There is also a stamp duty on agreements for leases. This is one of the many modes of taxation.

LEASE, in Scotland. [TACK, P. C. S.]

LEASE AND RELEASE. [RELEASE, P. C. S.]

LEASE, ACTION, PRINCIPLE OF. [ACTION, P. C. S.]

LEATHER. An account of the chemical processes by which the skins of animals are converted into leather is given under TANNING, P. C. p. 67; and under LEATHER, P. C., p. 140. In the former, the subject is treated in general terms, and the latter concerns the leather manufactured. The present article treats of the subject of curing and leather-dressing.

In the interesting lecture 'On Tanning and Leather-dressing,' read by Mr. Arthur Akin before the Society of Arts in 1850, and published in the fifteenth volume of the Society's Transactions,' pp. 192-214, is a notice of the principal kinds of skin which are converted into leather, and of the chief uses to which each kind is applied. From this we may conclude a few particulars illustrative of the wide range of the leather manufacture, from which it will be seen that the processes for different departments of the leather manufacture must be exceedingly various. Commencing with the larger and thicker skins, Mr. Akin observes that among those of oxen, technically known as hides, those supplied by bulls are thicker, stronger, and more elastic than those of cows, while the hides of bullocks, or castrated oxen, are intermediate between those of the bull and the cow. He states that the thickest and most substantial leather now in use is that made from the hides of the bull-wild cattle of South America. Such leather is employed for the soles of boots and shoes; for most parts of harness and saddlery; for making leather trunks, buckets, hose for fire-engines, and pump-valves; for the thick belts used in military accouterments; and for the gloves of cavalry. The thick buff-leather formerly used as armour, and which was pistol-proof, and would resist the edge of a sword, was made from the hide of the urus or wild bull of Poland, Hungary, Siberia, and South Russia, and the animal itself being called buffle, whenever the common name of the leather made from its hide. The skins of calves, though thinner than those of cows, are thicker than most other kinds of skins; they are made either by the tannin or sole, for the tanner. They are traced [TANNING, P. C., p. 40] for the use of bookbinders, and are tanned and cured for the upper leathers of boots and shoes. Akin states that it was formerly customary, in the southern part of England, to tan the hides of the celebrated Limerick gloves made of the exceedingly fine and delicate skins of the unborn calves. The practice is however, he adds, now almost discontinued, so that there are not much paper or manufacture refined upon them. For, in	

a considerable supply as coming from the Cape of Good Hope, vary much in quality. 'A long fleece, observes our authority, 'always indicates a thin skin; much of the jelly laid up in that organ being, perhaps, the material from which the leather is made. The antimony is a critical remark that 'as soon as a sheep has been sheared the air comes in contact with the cuticle, checks the perspiration and expenditure of the skin, and allows the jelly to accumulate; which is hardened by a further process of distilling, and with long fleeces are driven up to London from the distance of a few days' journey, and if part of them are slaughtered immediately on their arrival, the remainder are sheared and also tanned; and although as is unnecessary, they will be twice as thick as that of the former.' 

When simply tanned, sheepskins are employed for inferior bookbinding, for leathering bellows, and for various other purposes for which a cheap leather is required. All the white-leather, as it is termed, which is used for whip-lashes, bags, aprons, &c., is of sheepskin; as are also the cheaper kinds of scath-leather, of which brushes, gloves, under-white, and other articles of dress are made. Mock or imitation morocco, and most of the other coloured and dyed leathers used for women's and children's shoes, carriage-linings, and the covering of stools, chairs, sofas, writing-tables, &c., are also made of sheepskin. Lambskins are most generally dressed white or coloured fawn; and those of goats and kids supply the best qualities of light leather, the former being the material of the best morocco, all other skins, while kid and coloured are, however, chiefly in use for those of goats, skinned and sometimes gilt, was formerly used as a hanging or covering for walls. [TAPASTRY, P. C., p. 68.]

DEER and antelope skins, shorn or dressed in oil or tallow, are used chiefly for riding-breeds.

Shamoyed leather breeches were formerly very much used, especially in the army, and as English shamoyed leather was in high repute, it was used not only in the clothing of our own army, but also by the cavalry of Prussia and most of the other German states. During the Peninsular war it was discovered that the health of the British cavalry was seriously affected in wet weather by their leather breeches, which, in the intense cold and wet which chilled the men, and rendered them liable to rheumatism and other diseases. Woolen cloth was accordingly substituted for shamoyed leather in this article of dress, first in the British, and subsequently in the Austrian and French armies, and this change has effected a great decline in this branch of the leather manufacture. Horse-hides, which, considering their size, are thin, are tanned and curried, and are used by the harness-maker, especially for collars; and occasionally, when pared thin, for the upper leathers of ladies' walking shoes. Dog-skins are thick and tough, and make excellent leather; but Akin finds that they are entirely covered with the hair, and have fallen off so much of late years as to be nearly extinct, dog-skin leather has been in a great measure superseded, as a material for dress shoes, by horse leather, the skin of the horse being ulcerous, and inferior to that supplied by dog-skins; and hog-skins afford a thin but dense leather, which is used exclusively for covering the seats of saddles. 'It comes,' Akin states, 'from Scotland and Yorkshire; for, though hogs are abundant in every part of the country, the general custom of cooking pork with the skin on greatly restricts the supply.'

Referring to TANNING, P. C., for an account of the processes by which hides and skins are converted into leather by tanning, tawing, or shamoying, we may here notice some important observations on the subject quoted by Dr. Ure, in the Supplement to his Dictionary of Arts (art. 'Leather,' p. 147), as printed at the order of the Franklin Institute, in February, 1843. Mr. Lee expresses his belief 'that much of the original gelatine of the hides is never combined with the tannin, but is wasted; for he thinks that there is in the 100 parts of gelatine the weightless, a trancerous matter, should, on chemical principles, afford at least 180 lbs. of leather.' He believes the usual mode of preparing the hides for actual tanning, called the lining and tawing, or the mastication of the skins while in a cold state, under TANNING (p. 37), is this usually done either by steeping the hides in a solution of lime, or by placing them in a close heated chamber until the epidermis is loosened by insensible perspiration, a subject on which the preceding treatise, compiled by a process termed sweating, which is employed in Germany, and consists in laying the hides in a pack or pail, covered with tan, to produce fermentative heat. All of these plans, but
chief operations of the rectangular cutter into four. Of these the first is
styled 'dipping the leather.' It consists in moistening it with water, and beating it well upon a strong hurdle of basketwrigs, or a kind of trellis-work of wooden spars, with a mallet, or with an instrument called a mace, which may be described as a large mallet, with a cubical head, to which are inserted four egg-shaped pegs of hard wood, turned smooth and polished, that they may not tear the softened leather.

After this beating, by which the stiffness of the hide or skin is destroyed, it is spread over the inclining side of a clean table, cleaned, and wherever it is too thick, pared or shaved down on the flesh side, by the careful application of various two-handled knives; and then thrown again into water, and well secured by rubbing it with hair soap, or by placing it the one way with a piece of many gossips, or with a piece of fatty girt, by which means the bloom, a whitish matter which is found upon the surface in tanning, is removed. The second process, according to Dr. Ure's division, is the rubbing of the leather with a wooden instrument called the pommel (French, manuauel), which, he states, is so called because it clothes the palm of the hand, and performs its functions. It is a rectangular piece of hard wood, about twelve inches long and five broad, flat on the upper surface, which is provided with a leather strap, fastened at both ends, to secure it to the hand of the workman, and somewhat rounded or convex on the lower surface, which is covered with triangular grooves. This instrument, when applied to severe parts of the skin, with grooves of various degrees of fineness, and also, for some purposes, pommels of cork which are not grooved at all. In using the pommel, the object of which is to give grain and add appearance to the leather, is first applied to the flesh side inwards and rubbed strongly with it; and subsequently it is rubbed with the pommel upon the grain side, without being doubled or folded. Third in order he places the scraping of the leather with tools applied nearly perpendicular to its surface and worked forcibly with both hands, to reduce such parts as may yet be left too thick for a uniform substance; and he notices as the fourth operation the dressing of the leather with the round knife (French, tafete), a singular instrument shaped somewhat like a saucer, with a cutting edge, and with a hole in the centre for introducing the hands of the workman.

It is usually from ten to twelve inches in diameter, with the central hole about four or five inches. This tool is applied with its concave side downwards, and with it, the leather is stretched over a cylindrical wooden beam, the currier dexterously parts off the cosier fleshly parts of the skin.

In addition to these operations, which cannot be minutely explained without going too much into detail, the currier uses occasionally polishes of smooth wood or glass for rubbing the surface of the leather; and, when the leather is intended for the use of the shoemaker, he applies to it some kind of ready composition called dubbing (daubing) or stuffing. This is frequently done before using the pommel, and Dr. Ure states that the skins or doe-skins in cod-oil. As, however, his account is less distinct than that of Hebert (Engineer's and Mechanic's Encyclopedia, vol. ii. p. 71), we shall follow the latter, presuming that the reference is to the dressing of the leather for the upper parts of shoes or boots. On receiving the calf-skins from the tanner, the currier first, according to this authority, removes the offal parts, such as the head, tail, and shanks, which operation is termed rounding the skin. It is then soaked, shaved, and secured as above described, in the course of the second of which operations the currier frequently examines every part of the skin, testing its thickness by passing it double between his fingers. After being thoroughly cleaned, and distended while thus in a wet state, the skin is stuffed. Hebert states, 'with a mixture of two parts cod-oil, and one part tallow, called dubbing, which is applied to both sides of the skin.' After the oil and tallow have been applied, he adds, 'hung up to dry, by which the moisture evaporates, and the oil, which cannot be dissipated by mere exposure, gradually takes the place of the moisture, and sinks deeply into the substance of the skin. The second operation of this operation, and is succeeded by whitening, or lightly shaving the flesh side over again, by which it is thoroughly cleansed, and brought to a proper state to receive the colour used in waxing.

The coarse part of the skin is again rubbed with the pommel a second time, which brings it to the state of finished russet, in which state it can best be preserved until wanted for use. In the operation termed waxing, a colour or blacking is melted into the tallow already immersed, and rubbed well into the flesh side with a hard brush, the grain side being carefully kept clean. A coat of strong size and

The time occupied in the first four cases of quick tanning is stated to be three months. Dr. Ure adds that sole leather generally contains no less than 40 per cent. of vegetable matter. The inner white part of every astrigent bark, or that which lies next to the leather, contains the most astrigent matter, and the largest quantity of tannin, and the middle coloured part the largest quantity of extractive matter, while the outer surface or epidermis seldom furnishes either tannin or astrigent matter; and as young trees abound most in the white cortical layers, it follows that they are more productive of tannin, in proportion to the comparative weight of the bark, than old trees. The different qualities of leather made with the same kind of skin, Dr. Ure observes, 'seem to depend very much upon the different quantities of extractive matter it may have absorbed.' The leather made with infusion of galla, he adds, 'is generally harder and more liable to crack than the best boiled; but, according to Dr. Ure, apparently contains a much larger proportion of tannin, and a smaller proportion of extractive matter.'

Currying is the general name given to the various operations performed on the leather, by which the requisite smoothness, lustre, colour, and suppleness is imparted, to adapt it to the various purposes of the shoemaker, the coach and harness maker, the upholsterer and other purveyors. In the case of leather intended for soles, or such coarse purposes, is generally cured before being delivered to the workman who finishes it, dividing the

especially the latter, are said to be injurious to the hide. *" The term *tanning* is thus explained by Dr. Ure: 'Tanning is a process analogous to that described in TANNING under the term raising, consists in steeping the hair hides in a solution of pigeon's dung, containing, Mr. Lee says, mucilage of ammonium and of tannin. Marnham also mentions ammonium of ammonia and lime, with urate of ammonium, and very fermentable animal matter. Dry hides are often softened by the operation of the fulling-stocks, which has the effect of opening the pores of the hide, where a spirituous liquor, or other fermenting fluid, is added, care must be taken that the fulling or beating be not too violent, in which case it would make the hide too limber and thin. Mr. Lee conceives that the liming process is injurious to the hides. In consequence of this process, the hair is found to be very loosened by the mere softening effect of moisture, without fermentation. In quoting Mr. Lee's observations Dr. Ure makes no remark on the enormous amount of the increased weight which such wet hides appear to suffer in consequence of taking up moisture: it is not the least of Mr. Lee's observa- tion or upon the circumstance that a great increase of weight by the addition of vegetable matter has been shown by himself (TANNING, P. C., p. 88) to be a disadvantage. In order to judge of the efficiency of the process of tanning by comparing the weight of the tanned with that of the untauned hide, the relative proportions of animal and vegetable matter in the finished leather must be known. In illustration of this very important point, we may enter into a table to form the results of an analysis of specimens of calf-leather tanned in various ways, as given by Dr. Ure in the Dictionary of Arts (not the Supplement), art. 'Leather,' p. 768. |
tallow is then laid on with a soft brush, after which the surface is rubbed with a smoothing-glass. The finishing gloss is given by a little thin size laid on with a sponge, after applying which 'the skin is laid up to dry and incorporate,' according to Mr. \textit{S.} and Saint of London. The allowance is rubbed on lightly over the surface. 'The skin is thus,' he adds, 'completely finished for the consumer; and leather so dressed is found superior in appearance and durability to any other method.'

Leather is occasionally dressed 'black on the grain,' or having the hair or grain instead of the flesh side coloured. The currying operations in such a case are similar to those already described, but the first blacking is applied to the red skin immediately after scouring, by rubbing it with a solution of copperas. A brush dipped in stale urine is then passed over the surface, and an iron slacker is used to make the grain come out as fine as possible. It is then stuffed with oil, and, when dry, seasoned, or rubbed over with a brush dipped in copperas-water, on the grain, until it is perfectly black; after which it is slipped with a gristone, to remove any wrinkles and smooth down the coarse grain. The grain is finally raised by repeatedly rubbing over the surface, in different directions, with the pommel or graining-board.

One of the most singular operations in the working of leather, which may be noticed here as an illustration of the peculiar properties of the material, and of the power of the currier over it, is the mode of covering the roofs and upper pannels of coach-bodies, of which an interesting description is given in 
\textit{Black on the Grain in a Coach-factory.}' In this operation, which is only performed upon the higher class of carriages, the whole of the roof and upper part of the front, back, and sides, is covered with a single layer of the best skin, one for the roof, one for each side, and so on, but made to fit closely in every part to the work-work without any joints or divisions, and without showing any folds or wrinkles. 'To accomplish this apparently impossible feat, the hide, which is very large, and of sound quality, is, to quote from the paper referred to, 'first thoroughly moistened throughout and thrown over the top of the coach, the edges having been sewn on all sides. The currier then runs it or presses it down all over the roof, until it lies close and even in every part. He next proceeds to one of the sides, and in like manner rubs and scaprs the leather till all irregularities disappear. 'A little consideration,' observes the writer, 'must show that a superfused fold of leather will occur at each corner; yet by working it towards a central point at the back or front, the currier succeeds in erasing or pressing out all irregularities, and in producing a surface sufficiently flat and regular, to enable him to operate. The paint-like edge of the leather is cut or trimmed to the beading which divides the upper from the lower panels. In many cases modern carriages have the roof only covered with leather, while the sides are black, nailed, and laced.

\textit{Japanned leather} of various kinds is used in coach-making, harness-making, and for various other purposes. Mr. \textit{A.} in his treatise on \textit{English Pleasure-Carriages} (p. 69), states that what is ordinarily termed 'patent leather' is covered with a coat of elastic Japan, which gives a surface like polished glass, impermeable to water; and that hides prepared in a more perfectly elastic mode of japanning, which will permit folding without cracking the surface, are called 'enamelled leather.' Such leather is usually made black, but may be produced of any required colours. 'All this japanned leather,' he observes, 'has the Japan annealed, something in the same manner as silver plate are laid between the skin and the skin to the heat of an oven at a particular temperature during several hours.' Boots and shoes are sometimes made of this enamelled leather, and they possess the advantage of never cracking. Black japanned leather is sufficient to remove any dirt which impairs their gloss.

Of the preparation of Morocco and some other kinds of leather which possess peculiar features in their manufacture, a notice may be of some interest. Mr. \textit{T.} in his \textit{P. C. C. C.} account of the manufacture of \textit{Russian leather}, called by the Russians themselves \textit{jucem}, which is usually dyed red with the aromatic saunders-wood, and is celebrated for being free from insects, notes how the skin is treated by the Russians against insects, but repelling them by its odour, so as to preserve books in the binding of which it is used. The skins are freed from the hair or fleece by steeping them in an aub-lye, then rinside, fullled, and fermented in a proper stream, after having been washed in hot water, for a week or more, to raise or open their pores. They are then cleaned, by working them upon the horse, on both sides. They are then soaked for about forty-eight hours, and then allowed to dry in the sun, finally being packed with a paste of rye-flour, in the proportion of 38 lbs. of flour to 200 skins, fermented with leaven. The skins, when taken out of the bath, are left in tubs for fifteen days, and then washed. Making the treat of the skin by astringent juice, they are immersed in a boiler containing a hot decoction (just sufficiently cooled to avoid injuring the animal fibres) of willow bark (that of \textit{Salix cinere} and \textit{Salix cauti-fera}), in which they are left for the action of the tanning juices, and then kept in an empyreumatic oil of the bark of the birch-tree, for the preparation of which Dr. \textit{U.}, whose account we have followed, gives full directions (\textit{Dict. of Arts.}, p. 719). This oil, to which the leather is indebted for its peculiarities, is applied only to the flesh side, and care must be taken to prevent its passing through and stain the grain side. Chevreul, having investigated the odouriferous matter of this oil, has given it the name of \textit{jucem}.
when he published his 'Engineer's and Mechanic's Encyclo-
dedia,' in 1839. This machine consists essentially of a stiff
circumferential frame or wheel, eight feet in diameter, revolving
horizontally upon a vertical axis, and carrying, on the under side
of its periphery, a series of circular polishers or grinders, whose
power may be obtained from any other source than the natural
force of the work to be performed. These, as the apparatus re-
volves, pass over a series of eight tables, circularly arranged,
and are thus so applied to the upper side of the skin that the
amount of pressure exerted upon the surface of each table can
be very accurately regulated. The tables are arranged so as to
be upon laid upon these tables, each of which is attended by
a man who lays the skin smoothly upon it, and moves it about
from time to time, so as to bring every part in succession under
the pressure of the polishing wire. The reflection, on the upper
side of the skin, of the light from the table, is so intense that
nothing could counteract the difficulties arising from the varying
substance of the skin, each table is further supported by a lever,
to one end of which is attached a trolley, on which the work-
man can place one or both feet. The effect of this arrange-
ment is that while both hands are left at liberty to manage the
skin, a greater or less pressure can be given at pleasure by
the operator, while, by entirely removing his foot from the trolley,
the tables may be caused to fall just clear of the rubber or polishers,
so that the skin will not be touched at all by them. That portion
of the surface of the table upon which the rubber operates is formed of brass, and adjusted to
a very perfect level by screws, and its edges are so slightly
bevelled off to prevent the rubber from striking the skin injuri-
ously as they come in contact with it. To obviate the com-
paratively trifling defect arising from the circular instead of
revolutionary mode of action, Mr. Devlin has contrived a ma-
tained similar machine, which is also described by Hebert,
in which the rubbers were attached to the periphery of a
vertical wheel about thirty inches in diameter, and the skin
was revolved, producing great reductions in the time and labor
of polishing the rubbers; but the serious practical objections to such a con-
tinuance are evident. Hebert did not know whether it had been
brought to work with advantage or not.

Leather-dressing machines, by which even very thin skins
may be divided into two thicknesses, each of which is capable
of being dressed as a perfect skin, have called forth much in-
genuity of contrivance. Descriptions of several such machines are given by Hebert, and of one, different to
any mentioned by him, in Dr. Ure's 'Supplement.' Before
such machines were introduced the reduction of thickness
necessary to bring many of the finer kinds of leather to the
requiring tension was effected solely, as it still is partially, by
paring or shaving the flesh side with a knife worked by hand,
an operation occupying much time, and requiring great nicety
to prevent cutting through the skin. The part shaved off,
also, being necessary in small pieces, was only available for
the making of gloves. By the use of a machine the best por-
tion of the leather, that with the grain side, is cut of a much
more even thickness and surface, with equal polish, as more precisely by hand; this removed portion is taken off in a more useful form; and the
whole operation is conducted more rapidly. Hebert states
that, to show the capabilities of a splitting-machine long used
by the manufacturer of 'Carrington' his machine can be used
for splitting sheep-skins into three equal parts, one of which, that
on the grain side, might be used as leather, the middle por-
tion converted into parchment, and the slice on the flesh side,
being unequal in thickness, and therefore unfit for any better
use, being used for glue-making. In this machine, which is
also represented and described in No. 563 of the 'Penny
Magazine,' the skin is drawn between two revolving rollers,
and presented, as it emerges from their grasp, to the edge of
a long and very sharp knife, which is kept continually moving
a little backwards and forwards with great velocity. As a
skin of unequal thickness could not be grasped in the proper
manner by the rubber rollers, the upper roller, instead of being solid, is composed of a number of
circular discs or rings of metal, about half an inch thick,
slipped on to an axis rather smaller than the holes in their
centre, so that the periphery of the rubber roller is composed. It
may be termed a planetary axis, which is a rod passing loosely
through holes in the whole series of discs between their centre
and their circumference, which is moved by the power of by its
ends, and turned upon itself in an opposite direction. By this contrivance the upper roller
is enabled to adapt its surface to that of the skin, which
is everywhere pressed with an equal force, due to the weight
of the discs of which the roller is composed. It is
stated in the 'Penny Magazine,' that this machine will split a
sheep-skin of the ordinary size in about two minutes, during
which time the knife makes from two to three thousand vibratory
motions to and fro. This machine, according to

Hemat, is the invention of Lieutenant Parr. In the machine
described by Dr. Ure, and in some others, the knife is sta-
tionary, and the cutting is occasioned by the application of a
steady force by which the skin is drawn against its cutting
edge; and in Duxbury's patent skin-splitting machine the
knife is fixed, the periphery of the wheel or disc is painted
on the rim of the wheel, and parallel to its axis. The skin to be
split passes round the circumference of a horizontal drum, the
axis of which is at right angles with that of the great
disc, and lies vertical to the plane of the table surface, and
which, instead of being perfectly cylindrical, has its sides
so hollowed as to present a concavity perfectly tallying with the
curvature of the periphery of the disc. As therefore the drum revolves, it brings the skin, which is confined closely
to its concave surface by a contrivance somewhat resembling
the upper roller in the machine above described, in contact
with the edge of the revolving knife, which cuts by a conti-
nuous onward movement, instead of a sawing action back-
wards and forwards. The extreme nicety required to fix
the concavity of the feeding-roller to the edge of the circular
knife, and to keep the knife or cutter itself perfectly true in
shape, appear to be the chief objections to this ingenious con-
tinuance.

We may close this article by referring to some practical
remarks on the choice or purchase of leather in the second
part of Mr. Devlin's 'Supplement.' The following is a
Knight's series of 'Guides to Trade,' premising that the sub-
ject of his complaint in reference to English leather is likely
to be, if it be not already, materially affected by the very
large and furious reductions which manufacturers under the tariff of 1842, and the still further reductions proposed in the governmental measure now (February, 1846) under discussion. After some remarks tend-
ing to prove a great deficiency of skill among shoemakers,
but even among tanners and curriers themselves, respecting the qualities of leather, Mr. Devlin
quotes from a pamphlet by himself for circulation among the London trade, on the 'Boot and Shoe Trade of
France, as it affects the interests of the British Manufacturer,'
the following remarks: — 'If we look, he says, 'to the nature
of our leather, to almost every description of our leather,
excepting that used for the soles, we shall find the article not
so good — so intrinsically good — as that which the French boot
and shoemaker can purchase; and what is more pertinent to
the matter is, that formerly it was not so, and that a more
honest consideration was paid by both tanner and currier to
the production of the highest degree of wholesomeness,
superiority of grain, a perfect blackness and uniform thinness,
and at the same time, without tampers and curriers, the
perfections. ' But what, he adds, 'cares the manufacturer?
He gets his work done rapidly, and, in consequence, cheaply;
and being, as he is, protected from the full effects of French
and other competition, he can give the prices we pay for, and
likewise, through this circumstance, feeling himself secure
of the commands of the home boot and shoemaker, he goes on in his capability, hurrying and driving through as much
business as he can, safe in his own interests, and never
perished, hurt, and insulted by those complaints which the
less fortunate and apparently more responsible shoemaker
is every day or hour under the compulsion of submitting to from
the consumer, about the leather breaking, tearing, or crack-
ing, or of its pressing on the foot with the severe hardness of
an uncomplying piece of wrought-iron.' After some remarks
indicative of his confidence in the ability of British manufac-
turers to excel in the financial and other matters of trade,
he disconcertingly do in some other kinds, he further observes that
were the same substance of leather to be wrought generally
into boots and shoes by the British manufacturer as is wrought
upon leather brought from foreign places, of which the
reflection would be still more glaring; and hence we are often
compelled into clumsiness, to make the coarse and unsightly
shoe which we may produce, the serviceable, and save the pocket
at the expense of the taste and the wish for more pliant and
pleasurable wear. ' Our roans too,' he proceeds, 'with
which we line our boots and shoes, can bear no comparison
with the roans of our neighbors; they are in many cases
hard and stiff and with the remains of the unextracted gelatine
matter of the skin, and are so secured on the grain with various
chalks and pigments to produce the requisite surface, that the
awl or needle in working is continually being thrust into

Digitized by Google
many loose fibres, thus rendering the work not anything like so agreeable or so perfect as it ought to be. Add to which the quick manner in which such lining dries and roughness in a shop, and in the bar of the customer. In purchasing dressed leather, Mr. Devlin recommends the shoemaker to take care that it be not of too large growth for its substance, and that, if waxed calf, it have a "free easy grain," not roughish, not rubbish in, but, when bent inwardly a little, discovering a series of diminutive ridges or curls,—a pretty correct token that such leather has not been taken down too deeply." It should always," he says, "be shown in the feel, not rank with grease, but yielding and smooth from the manner it has been wrought." Skins freshly curried should not be bought for immediate use, "all calf or other oil-dressed leather being the better to be laid by for a month or two before they are put on; leather in this condition, as the phrase is, "fattening," and thereby attaining a more durable character." "The qualities of sole leather," which is generally better in England than in any other country, are, according to the same writer, "defined by its closeness, weight, and, when cut, by the uniform healthiness of hue it offers to the sight; badly tanned hides being generally streaky, black, brown, grey, and green." Hebert describes two compositions which have been patented as "substitutes for leather." Of these, Gunby's, patented in 1824, consists of an elastic coating or varnish of glue-size, boiled linseed oil, lampblack, white lead, and pipeclay, varying in different cases according to the number of times the composition is acquired, spread upon cotton, linen, or woollen cloth, or upon felt; while Hancock's consists of a felted fabric of flax, cotton, or other material, covered with several coats of liquid composition. This substitute is chiefly intended for the manufacture of patent tins, but is suitable also for covering coach-tops, and for some other purposes.

LEDMUM, a genus of plants belonging to the natural order Ericaceae. It has a minute 4-toothed calyx, 5 spreading petals, from 10 to 10 stamens, anthers opening by two pores at the base. The flowers are somewhat similar in appearance, sessile, 5-lobed, stalked, and dehiscent at the base. The seeds are furnished with a membranous wing at each extremity.

L. latifolium is a small evergreen shrub, with an irregularly branched stem. The branches and under surface of the leaves are woolly; the calyx is very minute; the corolla white, with obvolute oblate petals. It has been commended as a staminage; but an infusion of the leaves in beer renders it unusually hearty, and produces headache, nausea, and even delirium. Pallas however says that they have been used with advantage in tertian aques, dysernities, and diarrhoea. The peculiar bitter flavor of this species is a native of the swamps around Hudson's Bay, Labrador, Greenland, and various parts of the United States. L. pustulare has linear leaves, with revolute margins, clothed with wool, and in this state it has a stem longer than the corolla. It is a native of North America, in the swamps of Canada and New York, also the North of Europe, Denmark, Silesia, &c. L. pustulare has somewhat similar properties to those attached to the former species. In Germany, a kind of beer is made from its leaves, and it has also been recommended as a febrifuge. This species was formerly admitted into the catalogue of British plants; but Mr. Babbage considers that it has no claim to appear there, and has omitted it accordingly.

L. Canadense has ovate petioloate leaves, white beneath; the flowers disposed in terminal large umbellate corymbles of a white or yellowish color. It is native of the swamps of Canada, soil or a very sandy loam answers best for the cultivation of the species of Ledum, and they are readily propagated by layers or by seeds. The seeds should be sown, and the seedlings forwards managed in the same manner as the Rhodo-dendron.

L. foliaceum, P. C. S.

LEFEVRE, FRANÇOIS JOSEPH, Duke of Danzig, and Marshal of France, was born of humble parents, at Raisbach, in Upper Alsace, on the 25th October, 1755. He was at first unwilling to receive his lord's son, and when his father, he enlisted, when eighteen years of age, as a private soldier in the regiment of French guards. He had attained the rank of sergeant-major when, on the breaking out of the French revolution, that regiment was dissolved. The changes which then took place in the government of France removed those obstacles which prevented the promotion of meritorious soldiers who were deprived of the advantages of fortune; and Lefèvre, having displayed sagacity and talent and services deserved, and in 1792 he became a captain of his regiment. In that capacity he was enabled to render some valuable assistance to the unfortunate family of the deposed monarch, counteracted by the court of Versailles, when interposed in their behalf, and, at the peril of his life, rescued them from an infuriated populace. His subsequent rise in the army was without precedent rapid, even at that period: on the 5th of November, 1792, he was made a colonel of dragoons, on the 2nd of December, in the same year, he was a general of brigade; and on the 10th of January, 1794, he rose to the rank of a general of division. While serving with the army of the Moselle, he distinguished himself at the combat of Lambach, and in the battle of Giebsberg. During the whole of the campaign in Germany and the Netherlands, under Fichergau, Moreau, Hoech, and Jourdan, he made himself conspicuous for his skill and courage. In 1796, when the French army under General Kléber had passed the Rhine [Kléber, P. C. S.], the Austrians, finding themselves compelled to retire from Uckerath, had entrenched themselves, twenty thousand strong, on the heights which surround the small town of Altenkirchen. Their formidable position was attacked on the 4th of June by Kléber, who formed his army into two divisions, the first of which, the advanced-guard, be it remembered, was commanded by Lefèvre de Furstenberg, and fell on that division, which boldly charged the enemy at the point of the bayonet, and, in spite of a most vigorous resistance, compelled them to retire in disorder, leaving behind them a large number of their killed and wounded. Thus were thirty thousand prisoners. On the 25th of March, 1799, was fought the memorable battle of Stockach, in which Lefèvre acquired fresh renown; with only eight thousand men he resisted, for many hours the attack of thirty thousand Austrians. For these eminent services however Lefèvre appears to have been but poorly rewarded, and there is extant a letter from him to the Directory at Paris, in which are contained the following passages. "I am thus characterised the poverty of France at that period,—"The definitive conclusion of peace," he says in it, "will enable the country to dispose with my services. I petition you therefore to assign me a pension which may maintain me in comfort. I ask not for carriage or horses, but only for bread. My services must be well known to you, and I shall not enumerate my victories; as for defeat, I have none to reckon." At the time when Bonaparte was placing himself at the head of affairs, the Directory, who supposed Lefèvre devoted to their cause, appointed him to the command of the guards of the army of the Rhine; but, on the morning of the 18th Brumaire (October 14th), he attended the meeting of the convention at Bonaparte's private residence, and cordially co-operated in their proceedings. He was also instrumental in extricating Lucien from a disagreeable position in the stormy meeting of the Council of Five Hundred, E. St. Clair, Bonaparte, P. C.; Bonaparte, Lucien, P. C. S. These important services were rewarded by the command of the seventeenth military division, whose head-quarters were at Paris.

In the year 1804 he was raised to the dignity of a Marshal of the Empire. He accompanied Napoleon the following year in the Austrian campaign, and in 1806 took an active part at the battle of Jena, where, though at that time upwards of fifty years of age, he fought on foot at the head of the guards.

In 1808 he was sent with an army of sixteen thousand men to invest Danzig, which was garrisoned by twenty thousand troops, besides a numerous militia, and the investment was completed on the 14th of March. A body of twelve thousand Russians, who came escorting to the relief of the Austrians, and Lefèvre was compelled to divide his force, and to detach a portion of them to oppose the Russians. On the 15th of May a severe action took place between them and the French, when the Russians were seconded by the troops of Murat, and General Oudinot, who had been sent by the Emperor to their assistance, successfully repelled nine Russian regiments, and a part of the Prussian garrison by whom they had been joined. The Marshal, however, in the midst of battle, and having designed to make, as far as the command and General Kalk- reuth offered to accept terms of capitulation; the long resistance which this fortress, among the strongest in Europe, was still able to make, rendered these terms as favourable as could
be expected. The garrison were allowed to retire with the honours of war, and to take with them their munition and baggage, on the condition of giving their parole not to serve during the space of one year against the French or their allies. The emperor, who was then occupying Buda, determined to despatch the two generals, who lent him so powerful an assistance, to join him in the honour of signing the capitulation, but with a similar generosity, they declined to share with him a triumph which belonged to the soldier. On the 17th of July, 1814, Lefebvre and Mathis accordingly devoted these events, Napoleon, who was desirous of reviving the high nobility in France, and to give additional lustre and more munificent rewards to the twenty-four grand dignitaries who were still in existence, was wont to confer on them the title of Prince. This marshal being highly esteemed by the army, and his eminent services during the wars of the Revolution having acquired for him the gratitude and respect of every Frenchman, he was chosen as the first person on whom to confer the ducal dignity. The siege of Danzig indeed was one of the most brilliant triumphs of the Prussian campaign. Eight hundred pieces of ordnance and immense magazines fell into the hands of the conquerors, and the capture of this important fortress not only secured the left flank and rear of Napoleon’s army, but left to Prussia only the stronghold of Pillau along the whole coast of the Baltic. (Lamartine, P. C.)

In the year 1808 Lefebvre joined the Peninsular expedition, and was appointed to the command of the fifth corps of the French army. On leaving, the Emperor had given him orders, and the latter was to be left behind, but when employed in the province of Biscay, finding that the enemy were seriously harrying the flanks of his army, he gave them battle, and on the 1st of November triumphantly executed his commission. It is said that on this occasion appears to have given displeasure to Napoleon, as it interfered with his plan of operations. He was afterwards present at the battle of Toulouse, where he had the command of the cavalry. (Lamartine, P. C.)

In the German campaign of 1809 he rendered himself conspicuous as a brave soldier and an excellent tactician, at the battle of Eckmühl and Wagram, and in the dangerous warfare among the peasants in the Tyrol. [It was also with Napoleon in the disastrous expedition to Russia, and had the command of the old guard, which was however seldom called into action; but during the retreat he showed considerable military skill, and, for the most part, accompanied his corps on foot, sharing every suffering and exposing himself to every danger in common with the privates.

During the campaigns of 1813 and 1814 he appears faithfully to have adhered to the declining fortunes of his master; and after the battle of Leipzig, when the remnants of the French army were called to fight for the defence of their native country, by none of his lieutenants was Napoleon more ardently cheered on than by Lefebvre. (February 10, 1814), at Arcis-aux-Aube (March 20), and at Mont-Miara (April 14), he displayed the same gallantry as in the more renowned but no more glorious fields of Wagram and Eckmühl. It is said that he was so much impressed that it was decided to remove Lefebvre greatly influenced the abdication of Napoleon, and at the first restoration of Louis XVIII. he was created Chevalier of St. Louis and peer of France. But on the return of his former chief from Elba, we find him again adhering to his fortunes, and accepting a seat in his Chamber of Peers, where however he held himself aloof from all discussions. (Journal des Débats of the 10th April, 1814.) At the second restoration of the Bourbons, he was excluded from the Chamber of Peers, to which he was recalled in 1819, having been a few years previously reinstated in his rank of marshal. He died at Paris on the 14th of September, 1836, and his body was interred in the Panthéon. But distinguished generals are perhaps more to be admired than his public character; it being difficult to reconcile his conduct, during the latter years of his life, with genuine patriotism. His manners evinced the modest simplicity of a soldier who had risen by merit alone; his indolence, which was proverbial, was rendered manifest by his leaving a widow so destitute, that she was obliged to sell her jewels in order to defray the expenses of her children; but his attachment to the memory of his wife, and the devotion with which he guarded the memory of her husband in the cemetery of Père-la-Chaise.

The character of this excellent woman, who was of the most humble origin, may be best judged from the following inscription on her monument in the cemetery of St. Helen's: (vol. iii. 389).

"There was another well known general of Napoleon, the Count Charles Lefebvre Demoussonet, whose name has some times been confounded with that of Marshal Lefebvre. He was condemned to death on the second restoration of the Bourbons, but he was enabled to take refuge in the United States. He perished in a shipwreck on the coast of Ireland, as he was returning to Europe, on the 22d of April, 1822. (Biographies de Napoléon, by M. de Charette. Biographie Moderne; Dict. Hist. des Batailles; Tissot, Précis des Guerres de la Révolution, Paris, 1821; Mémoires de la Duchesse d’Abrantes, Las Cases, Mémorial de St. Hélène; Court and Cabinet Memoirs of Napoleon, vol. ii, pp. 129-130.)

Lefort, FRANÇOIS, was the son of Jacques Lefort, member of the Grand Council of Geneva, in which city he was born in 1656. After having served as a cadet in the Swiss Guards in the service of the Emperor, in 1674, he followed the regiment belonging to the Duke of Courland, in the pay of the Dutch, he was induced to try his fortune as a military man in Russia, and obtained a captain’s commission from the Czar Feodor or Theodore Alexievich, and greatly distinguished himself in the wars with the Turks and the Tartars. Having in 1678 married Mademoiselle Souhai, whose father, a native of France, held the rank of lieutenant-colonel in the Russian service, he returned his native country in 1682, but, staying only for a few weeks, got back to Russia in time to be in readiness for the crisis which occurred on the death of Theodore (P. C., xviii. 20). His abilities being well known, he was appointed to be the Prince Galitzin, who governed the country under the Princess Sophia, in the name of her two brothers Ivan and Peter, one of the captains-general, a post of great importance, and was ordered to intercede on behalf of the Tsaritsa, or old national militia. In this capacity he first attracted the attention of the young czar Peter, in the early part of the year 1683; and on the 29th of June in that year he was made a count of the rank of major. When, in 1689, Peter took refuge in the Troitisk convent, Lefort was one of those who joined him there, and on the overthrow of the usurpation of Sophia, which followed, he became the chief minister of the emancipated emperor. Many of Peter’s greatest plans are believed to have been suggested by Lefort; all the Czar’s measures for civilizing and elevating his country found in him, at least, the most able and assiduous support. Holding at once the rank of general and that of admiral, Lefort was always equally ready for service by land or by sea; and his active and versatile faculties alone as much in civil affairs as in military. At last Peter lost this inestimable servant by his death at Moscow on the 12th of March, 1699: his health had been for some time declining, and a fever following upon the breaking out of an old wound carried him off. Peter lamented as he if he had been a brother. Lefort’s moral influence has been as admirable as was his capacity; considerations of self-interest were always postponed by him to the public good and to the glory of his sovereign, and a noble contempt of everything that could degrade or injure the whole character of the son, but he died at an early age. There is a Life of Lefort, in French, by Bassville; and there is a long article about him in the ‘Biographie Universelle,’ by Callot Calle- ville, who refers to him in his book. First, and second, the above outline has been abstracted. See also Valtorta’s ‘Life of Peter.’

LEGACY DUTIES. (Hargrave Duties, P. C. S.)

LEGION OF HONOUR, an order of merit in France, instituted by Napoleon during the year 1802, as a recompense for military and civil services. This order consists of five divisions: chevaliers, of whom the number is unlimited, officers, commanders, grand officers, and grand crosses. The members swear fidelity to the king, to the charter, and to the laws. The ordinary regulations require twenty-five years’ service during peace, and half that period during war, in a civil or military capacity. This is considered indispensable to the time of war, a brilliant exploit, or a severe wound, are deemed sufficient to qualify for admission into this order. This honour is frequently granted to any distinguished person who, by the pleasure of the king, is raised to a superior rank, is considered indispensable for natives of the country to have passed through the inferior grades. To obtain the rank of officer it is necessary to have served four years as a chevalier; and must serve two years to become commander; a commander three years to become a grand officer; and, finally, to obtain the highest grade, which is that of grand cross, he must have served five years as a chevalier. When a promotion takes place the king determines the number of decorations of each grade, and a distribution is made by the chancellor of the order in the following proportion, 40 to 40:--
2 to the minister of Justice and Religion.
1 Foreign Affairs.
5 Home Affairs.
2 Public Works.
20 Finance.
5 War.
1 Marine.
1 Public Instruction.
6 Grand Chancelier.
40
On all public occasions certain military honors are due to persons decorated with this order, and, at all times, a soldier on active service assumes on such occasions the decorations.

The following salaries are attached to the different grades: chevalier, 250 francs; officer, 1000; commander, 2000; grand officer and grand cross, 5000.

In the formation of this order, as at first designed by Napoleon, though of a strictly military nature, the honor was not restricted to military men alone, but was intended to be the reward of civil, scientific, and literary services. He wished, moreover, that the name which he gave it should imply its object, which was to form a body of the most distinguished citizens, specially bound together by the ties of honor and devotion to their country. The legion, which was to be composed of twenty members, was to be selected by a supreme council, composed of seven members, the three consuls, and four grand officers—the first of whom was to be chosen by the senate, the second by the legislative body, the third by the council of state, and the fourth by the council of state. He likewise enacted that all military men, who had previously received honourable distinctions for their services by the republican government, should be, of right, members of the order.

The proposition of the first consul, when presented to the legislative body and to the tribunate, met with a violent though not unexpected opposition. The representatives of the French nation could see in it nothing but a powerful weapon of military despotism, to be sooner or later wielded by one whose projects of absolute rule were beginning to be discovered. His brother Lucien, moreover, to whom the motion had been entrusted, by his imprudent zeal in urging its adoption, raised in the minds of many the idea that he was enforcing the interests of his family rather than those of the nation. Even in the council of state, which, by the nature of its constitution, was especially under the influence of Napoleon, it was deemed by some to be a most dangerous experiment, calculated to reanimate aristocratical feelings, and gradually to introduce the ancient régime; while others, among whom was the general Mathieu, who, though a good soldier, was distrustful that the institution should be restricted to military men.

Among the representatives of the people, the general expediency of the institution itself was still more strongly combated than it had been in the council of state. ‘Mathieu, ’ Cross says, ‘are the pillars of an hereditary throne; they were unknown to the Romans when they conquered the world.’ The first consul’s reply to these different menaces was many observations strikingly pertinent and correct. ‘Such ideas,’ he remarked, ‘ might be well adapted to the feudal ages, when the knights were accustomed to combat together, man to man, and the bulk of the nation was reduced to a state of slavery. But when the military system changed, it was then not prowess in war, but science and skill, which decided the fate of nations. In all civilized states military force must of necessity yield precedence to civil qualities. Bayonets must lower before the priest who speaks in the name of heaven, or the man of science who has obtained an influence by the ascendancy of his knowledge. Think not that it is as a general that I govern France; but because the entire nation believes no possessed of that ability in the direction of civil affairs so necessary to a ruler; without it I could not, for an instant, keep my ground.’—‘France, he continued, ‘contains thirty millions of men, united together by the ties of intelligence, property, and commerce; what are four hundred thousand soldiers in comparison to such a mass? and moreover, not only does a commander preserve his influence and ascendancy over the soldiers of his army chiefly in virtue of his qualities as a civilian, but, when his command ceases, he returns to the rank and position of a private individual. The natural tendency of military men is to carry every thing by force; the enlightened and educated civilian, on the other hand, elevates his views to the perception of the general good, and follows an opposite course of conduct. I have no hesitation in assuring you that, if a preference is to be awarded to the one rather than to the other, the French society was divided between the two orders, soldiers and citizens, you create disunion into what should be but one body.’

Influenced by these arguments, a majority of the council agreed to the proposed honors should be extended indiscriminately to civil and military men of distinction. At length, after many an angry discussion, the project was passed into a law on the 29th Floréal (May 19th, 1802), in the national assemblies; in each of them, however, by a small majority.

The Legion of Honour, though it undoubtedly seemed a forerunner to that new nobility which Napoleon, in after years, even attempted to mould into an institution in the highest degree important to his interests, and popular among the nation. On the 24th of July, 1804, Napoleon distributed to the principal civil and military dignitaries of France the higher order of decorations. The splendid church of the Hotel des Invalides was the place appropriately selected for the distribution. He had not as yet given the decorations of this order to foreign courts; as a prelude to doing so, he bestowed it upon the venerable Cardinal Caprera, who, in his capacity of legate, represented Pope Pius VII. at Paris, and, to enhance the value of the honour, on that occasion, detached from his own neck the ribbon of the order. He also created, about the year 1810, an aged representative of a church with which France, through his instrumentalities, had been happily reconciled. (Thiers, Hist. du Consulat, &c. b. x.)[121] [BONAPARTEE. P. C. A.]

But a short time before he ascended the throne, he placed in the line of march of the first consuls and many of the grand officers, in the large number of persons who were drawn up on the slopes of the great and famous hill, on the high stage of the great and famous amphitheatre, on the western side of the hill, on which is situated the so-called tower of Cassar. An elevated throne was raised in the centre of this theatre, and the soldiers were drawn up in front of it and on the hill below it, as if the whole of the place were the throne as their centre; beyond them was congregated a countless number of spectators. At mid-day the emperor ascended the throne, amidst the din of military salutes and the acclamations of the crowd; near him was placed the famed buckler of Francis the First, while the decorations of the order about to be distributed were contained in the helmet of the illustrious Chevalier Bayard. He was surrounded by his brothers, by the chief functionaries of the empire, by the marshals and generals of his army. Amidst this proud array were to be seen the ancient standards of the republic, the witnesses of the victories of Rivoli, Arcole, and Marengo. Napoleon, in presence of all these, and in the presence of the general Mathieu, who, then raising his voice, and addressing the veterans of his army, exclaimed, ‘Ye Crossed swords! ye men who have shared the hazard of your lives, the honour of the French name, your country, and your emperor.’ This animating appeal was responded to by the deafening shouts of the mighty multitude. The stands were filled in an instant, the place was cleared, and this imposing ceremony was concluded by a general review of the whole army, whose ranks drilled before the imperial throne. Napoleon estimated at twenty-five thousand the decorations he had distributed during the ten years of his reign. This remarkable institution has outlived the fortune of its founder. Its benefits were appreciated by the Bourbons, who, soon discovered that it was the most powerful means they could employ of increasing their popularity, and giving stability to their precarious position. It has been wisely adopted, and its utility has been increased, under the pacific reign of the house of Orleans. By its means the present king of the French has been enabled, at a comparatively small expense to the state, to consolidate the empire and to reward the merit of the most deserving citizens. It has been placed on the breast of an Arago, a Guizot, and a Thiers, with equal honour, and as much applause, as it had been on those of a Ney, a Massena, and a Lannes. It is to the credit of the French nation that, while no other people are perhaps so much under the influence of military renown, it could bestow this title upon those whose only claim to it was where men of science and literature are more generally esteemed and rewarded.

But the benefits which have accrued to the French from this institution may be best described in the eloquent
words of one of their living historians, in his history of the constable and the empire. 'The institution of this order,' he says, 'dates scarcely more than forty years' existence, and it is now consecrated in the memory of the people, as if it had passed through the lapse of many ages; so much has it become a custom for the years, a kind of solemnity, a sort of talent and merit of every kind; so much has it been sought after by the great and principal personages of Europe, those even who pride themselves the most on the honours of their ancestry. Thus that when he came out of the household, the head has declared in favour of its worth and utility. Leaving aside the abuse which has occasionally occurred in the distribution of its distinctions, under the various governments which have succeeded one another, an abuse inherent in all rewards bestowed by man upon his fellow men, let us gratefully recognize what there was novel in plan, profound in design, and beautiful in execution in an institution whose object it was to place on the breast of the common soldier, or on that of the unsung man of science, the same decoration which was destined to confer distinction on the commander-in-chief of armies, on princes, and on kings; let us recognize Office the creation of these honorific rewards, the most brilliant triumph of true equality, that equality which raises instead of abusing the minds of men; let us recognize, in short, that if to the great in civil or military life it might become a source of gratification, if it to the common soldier, returned to his domestic hearth, at once the pledge of honourable ease and a visible proof of his former prowess.'

(Thiers, Histoire du Consulat et de l'Empire, vol. iii.)

The author of this passage is yet to be identified, but it is clear that he has taken place in the members of this order, and also how liberally its honours have been distributed by the present king of the French. We are indebted for the latter part of these remarks to the late Mr. J. Conder, the London correspondent of a highly esteemed periodical. The following is an extract of the list of the officers of the Legion of Honour who were appointed in the year 1814, and who have received the order:

Total: 42,892

Thus it appears that there has been an increase during the reign of nearly 48,000 members; the diminution in the highest decorations has probably arisen from the deaths of many of the old and distinguished who died in the year 1844, 29,843 received no pension, and 19,851 drew the salaries attached to the order. The revenue during that year was 7,000,000 francs, about £280,000, and the expenditure 6,897,728 francs, about £275,500. Our information respecting that year is derived from the French newspaper 'le Courrier de l'Europe' published in London.

A full account of this order and of its most distinguished members may be found in a work entitled 'Fastes de la Légion d'Honneur,' 4 vols. Paris, 1842 and 1844.

LEGITIMATION. (Bairstow, P. C.)

LEGUMINOSITAS, a genus of fossil fruits, from the Isle of Sheppey. (Bowerbank.)

LEICESTER, OF HOLKHAM, THOMAS WILLIAM COKE, EARL OF. Thomas Coke, Esq., of Holkham, Norfolk, grandson of Sir Edward Coke, the chief-justice, was in 1728 created Baron Lovel, of Minster Lovel, in Oxfordshire; and in 1744 Viscount Coke of Holkham, and Earl of Leicester. On his death without heirs his estate devolved on his sister Anne and her husband, Colonel Philip Roberts, who thereupon assumed the surname and arms of Coke. The subject of the present notice was his son, by his wife Elizabeth, daughter of George Edwards Denton, Esq., and was born on the 4th of May, 1752.

His father, who had been returned to parliament as member for the county of Norfolk at the general election in 1774, having previously been for Harwich, was, in 1775, returned for the town of Derby, died in 1776; upon which his son succeeded in the representation of the county. In a speech which he made at a dinner given to him in 1838, he stated that he had been slow to come forward on this occasion, with great reluctance, being no orator or politician, having just returned from abroad, and being attached to other pursuits. They told him however that if he would not stand, a Tory would be sure to; and upon this he was all chilled over from head to foot, and he resisted no longer. This horror of Toryism, or of what he imagined that term to mean, constituted nearly the whole of Mr. Coke's political system to the end of his life. He was returned again for Norfolk at the next general election in 1780; but after the dissolution in March, 1784, he was one of the numerous supporters of the late unpopular Coalition Ministry, who were thrown out, and who received the name of Fox's Martys. He recovered his seat however in 1790; and he was also reelected without a contest in 1796 and in 1802. At the next general election, in 1806, he was returned by a majority of 411 to 3772 for Mr. Williamhowe, but was unseated by a Committee of the House; upon which he was elected for the town of Derby, and his younger brother, Mr. Edward Coke, who had vacated his seat for that borough, took his place at the election for Norfolk in 1807. At the next election, in 1807, Mr. Coke became again member for that county, which he continued to represent down to his retirement from the House of Commons in 1833.

Mr. Coke, though a keen and steady partizan, was not a frequent speaker in parliament. The two occasions on which he appeared most conspicuously were, on the 24th of March, 1783, when in a short speech he moved an address requesting that his majesty should be pleased to form an administration entitled to the confidence of the people, which, being assented to, was followed by the resignation of Lord Shelburne and the formation of the Coalition Ministry of Mr. Fox and Lord North; and on the 2nd and 3rd of February, 1824, when he carried two motions against the existing ministry of Mr. Pitt, which however had no effect. He also on subsequent years came forward on some occasions when measures affecting agriculture occupied the attention of the House. In all matters of general policy he voted with Mr. Fox, and after his death with Lord Grey and what was commonly called the Whig party.

His influence in the country arose from his large estates and the lead he took in agricultural improvement, together with his popular qualities as a landlord and a country gentleman. He is said to have raised the value of the estate of Holkham, in the period of between sixty and seventy years during which it was in his possession, from little more than 2000l. to above 20,000l. From the death of Francis, duke of Beaufort, when he succeeded to the estate of Holkham, it passed to the 2nd Earl of Leicester, of which estate he inherited, but which had in the mean time been bestowed, in 1784, upon Lord Ferrers, afterwards Marquis of Townshend, to whom it passed. It is said that he thought a very strong measure, when, to gratify the old man, the same title, with the slight and not very intelligible variation, 'Leicester of Holkham,' was bestowed upon a second person. It is also said that the same title, with the addition of which Mr. Coke had subsequently acquired a higher title; he was still notwithstanding as much Earl of Leicester as Marquis of Townshend. The proceeding was precisely of the same
nature as if Mr. Coke had been made Duke of Wellington, of Holkham.

The Earl of Leicester died at Longford Hall, Derbyshire, on the 30th of June, 1832, at the venerable age of ninety. He was twice married: first, in 1775, to Charlotte, daughter of James Surman, Esq., who died in 1800, and by whom he had three daughters, and many grand-children and great-grandchildren; secondly, on the 26th of February, 1822, to the Lady Anna Amelia Keppel, eldest daughter of the Earl of Albemarle, who was then not quite ninety, and who brought him three sons and a daughter. The eldest son, born on Christmas-day, 1822, is now Earl of Leicester.

MEMOIRS OF THE LIFE AND TIMES OF THE EARL OF LEICESTER, written by Edward Vestey, &c., published in 1842. See also in the number for December, 1842, a short notice of his will, in which he is said to state in that document that he had lately expended the sum of 500,000l. in the improvement of his estate.

LEI'odon, a genus of fossil reptiles. (Owen.) One species found in the chalk of Norfolk.

LEIPA (generally called Böhmisch-Leipa), is a town in the circle of Leitmeritz, in the kingdom of Bohemia, and in the lordship of Neuensch, belonging to Prince Kunnit. It is situated on the river Polza, and has about 6000 inhabitants, who have flourishing manufactories of woolen-clth, cottons, calicoes, and very beautiful earthenware and glass-works. There are a gymnasium and a high school in the town.

(Hörschelmann, Handbuch; Stein, Leizon; Cambriaich, Lehrbuch.)

LEJRE, a genus of plants belonging to the natural order Aroidee, and the suborder Lennaeoc. It has a 2-sowered membranaceous oculate spathe; the male flowers consist of two stamens; the fruit is reticulate and indesiccous. The flowers are almost diminution of stems and leaves. The flowers appear just below the margin of the frond. Several species have been described. 'They are all inhabitants of stagnant waters, and are known familiarly by the name of 'Duck-weeds.'

(From the Bay of British Birds.)

LEMOINE, FRANÇOIS, a celebrated French painter of the eighteenth century, was born at Paris in 1788. He was the pupil of Louis Galleuche, early distinguished himself, and in 1772 he was elected a member of the Académie de Peinture: his presentation-piece was an excellent picture of Hercules killing Cacus. He obtained a great reputation by his painting, in oil, of the Transfiguration of Christ on the ceiling of the church of the Jesuits, Rue du Bac. In 1794 Lemoine visited Italy, where he remained for a year; the artists whose works chiefly attracted his attention were Pietro da Cortona, Lanfranco, and Bernini. After his return to France he was made professor of painting in the Académie, and in a few years his reputation surpassed that of all his Parisian contemporaries: Louis XVI. appointed him in 1796 his principal painter, with a salary of 40,000 francs, in the place of Greuze, who had just died. The first and most celebrated of Lemoine's great works was the cupola of the chapel of the Virgin in St. Sulpice, in fresco, which he commenced in 1792, and which formed the King's ladies' bower. His second is the Apotheosis of Hercules, painted in oil on canvas pasted on the ceiling of the Salon d'Hercule at Versailles, commenced in 1792 and finished in 1796. It is a grand composition, containing one hundred and forty-two figures, and it is the most extensive and most magnificent monument of painting in France, though in a florid and superficial style, and, like the works of his model, Pietro da Cortona, belongs to the class of works called piturescse by the Italians. The composition is arranged in nine groups, is vigorous and effective in arrangement, colour, and light, and especially in aerial perspective; but it is a purely decorative work, and is effective only as a pattern; it has little individual merit, and the drawing wants correctness, expression, and distinctive character. Lemoine used on the ground of this picture, the blue vault of heaven, ultramarine to the value of 10,000 francs; it was finished in the fifty-four.

After the completion of this great work he was without a rival in France, but he never enjoyed his success. He was naturally of a melancholy temperament, a weakness which the charge imposed on the artist, the constant apprehension arising from an insatiable ambition, combined with vexation on account of the depression of his less successful contemporaries, aggravated to that degree that it amounted to a chronic aberration. In 1778 he destroyed by an accident his nervous fits, June 4, 1737, ten months after the termination of his great work at Versailles, and in the fiftieth year of his age.

Lemoine painted also many excel-lent pictures, both of large and of very small dimensions, and the latter have realized high prices at auctions: a Flight into Egypt is considered his best easel-piece. There is not a single picture by him in the Louvre at Paris. Many of his works have been engraved by Done, Lemaitre, J. N. whilst others by H. S. Thomas, Silvestre, Larisseau, Costard, &c.; Louchet, Natoire, and Noisette, distinguished painters, were the pupils of Lemoine.

(D'Alembert et Diderot, Dictionnaire des Arts, &c. ; Gault de Saint-Germain, Trois Siecles de la Peinture en France.)

LENSCISCUS, L. ENGLISH, a native of Ascot in Berkshire, a district of the ancient province of Orléans in France, on the 13th of April, 1661, and was the son of Paul Lensant, the Protestant minister of Châlille-sur-Seine. Being destined to the same profession as his father, he was sent to prosecute his studies at Saumur; during his residence at that university he lived with the learned Jacques Cassel, the professor of Hebrew, with whom he formed a friendship which continued during their lives. He afterwards completed his theological education at Geneva and Heidelberg, in which latter town he was admitted into the ministry of the Protestant church in December, 1678; during the month of April he was ordained. In 1687 he obtained the appointment of minister of the French church at Heidelberg, and chaplain to the Dowager Electress Palatine. The invasion of the Palatinate by the French troops, under Marshal Turenne, in 1692 drove him to leave Heidelberg in 1688, and he settled at Berlin. The fear of meeting his countrymen arose from having rendered himself obnoxious to the Jesuits by two letters which he had written against them, entitled 'A Preservation against a re-union with the Church of Rome.' Though the Protestant French church of that city had already a sufficient number of pastors attached to it, the accession of Elector Brandenburg, who was at that time King of Prussia, who knew Lensant by reputation, appointed him to that church, where for upwards of thirty-nine years he performed duty. In the year 1706 he married Mademoiselle de Courgues, daughter of a French Protestant minister from Poitou. In 1707 he visited England, and it is recorded that he was admitted to preach before Queen Anne, though we do not understand how he could have been permitted to do so without having received episcopal ordination; it is further stated that the Queen wished him to enter the Church of England, and offered him, in case he resolved to do so, to appoint him her chaplain. In 1710 he obtained the situation of chaplain to the King of Prussia, and consented to the high consistory. He was also a corresponding member of the Society for the Propagation of the Gospel in Foreign Parts, which had a few years before been established in London. Lensant was succeeded in his situation by his first associate. His death was the more regretted, as it came amidst enjoyment of perfect health, on the 29th of July, 1728, and he died on the 7th of August following.

His character was a short-piece however was not ennobled, and his manner simple and modest. Of a reflective turn of mind, he spoke but little, and that little well. Though a most voluminous writer, he was fond of society, and opened himself with out reserve to the confidence of his friends. He is said to have had few personal enemies, which may be readily believed, for his character is universally described as remarkable for its disinterested charactery, and for the exercise of the peaceful virtues of a Christian. As a preacher, his manner was pleasing and persuasive; the manner of his discourse was chiefly of a practical nature, and his eloquence was rather chaste than energetic. His varied talents and the depth of his learning have made him a source of instruction to numberless and valuable works which he has left, many of which are of indispensable utility to the theological student. The style of his writing is elegant, though never florid; it has no less force than that of Juvénal [Juvenal], and in eloquence than that of Saurin [Sarin, P. C.], but the French is more pure, and the diction more chaste. In one respect especially he is far superior to any of the French Protestants; he is nearer to those of the latter years of his life, contain little asperity and few severe expressions of condemnation against those who differed with him in opinion. It is not certain whether he died during the period of the 'Guerre de l'Allemagne,' which was commenced in 1720, but it is well known he took a prominent part in its execution, and he is the acknowledged author of the preface.
LEO

LEP

Lenfant's first work, which appeared in 1688, was a review of one of Bruyès, who, though a celebrated French dramatist, has written several theatrical works in defence of the Roman Catholic faith. In 1688 he published a translation of a selection from the letters of St. Cyprian, in 1690, a defence of the Holy Embassy to Pavia, annexed to his "Preservative," etc., a work we have before alluded to; and in 1691, a Latin translation of the celebrated work of the artists and architects of the French Revolution, "After Truth." His history of the female of the Pope Joan, appeared in 1694; the arguments in it are drawn from the Latin dissertation on that subject of Spanheim. It is said, however, that, in after life, Lenfant and his wife provided for the support of their family and the publication of a work of fiction. [Joan, Pope, P. C.] In 1708 he appeared his remarks on the Greek edition of the New Testament, by Mill, which are in the "Bibliothèque Choisis" de Le Clerc, vol. xvi. The following works afterwards appeared in succession: 1, Réflexions et Remarques sur la Décision du Parlement à la matière d'un Juif; 2, Souvenirs Historiques touchant la Communion sur les deux espèces; 3, Critique des Remarques du Père Vauban; sur les Réflexions de Rapin touchant la Poésie; 4, "Réponse de Mons. Lenfant à Mons. Dartin au sujet du Socinianisme." The above short works are to be found in the "Nouvelle de la République des Lettres," a review to which Lenfant was a frequent contributor.

In 1714 was published his learned and interesting "History of the Council of Constance," 2 vols., Amsterdam. Two years after he wrote an apology for this work, which had been severely censured by the latter, and to which he added a notice of the treatises of the most remarkable events during the interval between it and the Council of Constance, a learned and most accurate work, written with sufficient impartiality. 1724; 4, 4, A Volume containing sixteen Sermons, on different Texts of Scripture," 1728; 5, 5, "A General Preface to the Old and New Testaments," which is appended to the French Bible in octavo, published at Hanover and Leipzig in 1728; 6, "A small volume of Remarks on Gibert's "Treatise on Pulpit Eloquence." The last work of Lenfant is one which has greatly added to his already high reputation, "The History of the Wars of the Hapsburgs, and of the Council of Pavia," a remarkable piece of work, written in a most accurate and impartial manner. It is a detailed account of the events of that time, with particular regard to the relations of the Council and the Empire, and the most remarkable events during the interval between it and the Council of Constance, a learned and most accurate work, written with sufficient impartiality. The important details of the life of Lenfant have been taken from a memoir annexed to the above work:

LENTIBULARIÆ. [LENTIBULARIAE, P. C.]

LEPIS (from λεπίς, 'a line, and στειρός, 'a tail'), a genus of plants belonging to the natural order Labiate. The anthors approximate in pairs, with parallel colls and naked valves. The upper lip of the corolla is nearly flat, the lower one triated, with the middle lobe abraded. The calyx is tubular and 5-toothed; the nuts flatly truncate.

L. cardiacus, Mother-wort, is a bitter herb, with a pungent unpleasant smell. The stems rise from 2 to 3 feet in height; they are smooth, and armed. The leaves are long-stalked, somewhat downy, and of a dark green colour. The lower leaves are the broadest, and deeply jagged, the upper ones 3-lobed, and those about the summit incoarate and divided. The flowers are of a purple and externally hairy; the calyx rigid and pungent. It is found in hedges and waste places in Great Britain, all over Europe, and the middle of Asia. The reputed tonic powers of this herb are in reality inapparent. Bitters and cocktails, cardinals, or heartburn, are now disregarded: from being used however in the last complaint it derives its name. It has been extolled by the Romans as an antidote to curare madness, and bees are said to be fond of the juice. L. macrostemon has elongated pubescent branches, oblong ovate-toothed leaves, the calyx nearly glabrous, and the corolla small, white or pale-red, and shorter than the calyces, and which are subulate, spiny, and diverging. It is found in waste places throughout Europe and Asiatic Russia. There are eight species of Leucandra described by botanists as growing chiefly in Europe and the North of Asia. None of them are very ornamental, and being biennial plants, the seeds only require to be sown in the summer to ensure the perennial growth.

(Don, Gardner's Dictionary; Lindley, Flora Medica, Babington, Manual of British Botany.)

LEPIDIUM [LEPIDIUM, P. C. S.]

LEPIDIUM (from λεπίς, a scale, in allusion to the form of the pods, which resemble little scales), a genus of plants belonging to the natural order Cruciferae, and the tribe Cruciflorae. The most noteworthy is the common Lepidium, or Horsenail, which has the seed notched or entire, compressed valves, keeled or winged at the back. There is but one seed in each cell; the filaments are simple. The species consist of herbs or small shrubby herbs with small white flowers. This genus is divided into seven sections, the first of which, Cardaria, is so called from the heart-shaped form of the silicles. To this section belong:

L. draba. It has oblong leaves, entire or toothed, the lower ones narrowed into a footstalk, the stem-leaves sagittate and amplexicaule, the style as long as the disseminate. It is native in the south of Europe from Spain to Taurin, and from Greece to Paris. It was introduced into Great Britain probably by foreign seed, and is now found in the hedges of Kent.

L. sativum, common Garden Cress, belongs to the section Cardamom of this genus. It has orbicular pods, variously cut with winged leaves, those of both are toothed, and the pods and seeds resemble those of Lepidium and the island of Cyprus in corn-fields. There are three varieties of the species: the broad-leaved cress, which is cultivated chiefly for rearing young turkeys; the curled variety, which is sometimes considered preferable as a garnish; and the common plain-leaved cress, which forms one of our earliest spring salads, and has a peculiarly warm and grateful relish. All the varieties are raised from seed, of which one ounce will sow a square yard, and four square feet. Cress should be raised four or five times a month so as to have the crops delicately young in succession. When raised in the open garden it should be sown early in March, and if the weather be cold it should be either with matting or a frame during the night. Cress is often raised on porous earthenware vessels of a conical form, having small gutters on the sides for retaining the seeds. These are called pyramids; they are somewhat ornamental in winter, and afford repeated gatherings. This species is the Lepidium sativum. It has downy leaves, the upper ones toothed, the lower ones oblong and narrowed into a footstalk, the stem leaves lanceolate, sagittate, and amplexicaule. It is distinguished from the other species by the pod being ovate, rough, and covered with minute scales, notched and rounded at the end, the stem less than an inch thick, and the calyx. It grows on dry gravelly soil in Great Britain. L. sativum has ovate lanceolate leaves, serrated or entire; the pod is oval and downy. It has numerous small flowers in compound leafy racemes, the flowers of a purplish colour, also of Aligiers, and of several parts of England generally near the sea. It has a very hot biting taste, and has been used instead of horse-radish, occasionally as a salad; the poor people are in the habit of eating it as a condiment to their food, hence it has acquired the name of Poor Man's Pepper.

An infusion of it acts as an emetic. Fras. believes this to be the echium drupa of Dioscorides, 2, 147, although it is usually referred to the Brassicac cretis. It is also the Lepidium of Pliny, 20, 17. 19. 19.

The green-house plants will thrive well in any kind of light soil, and are readily propagated by cuttings planted in peat. They like to be kept under a half-glass roof, but may be sown in the open ground, or by dividing at the roots or by seeds, will grow in any kind of soil. The hardy annual kinds only require to be sown in the open ground. None of the species are worth cultivating in the garden.

(Ton, Gardner's Dictionary; Babington, Manual of British Botany; Fras, Synopsis Flora Classicvs; Burnett, Outlines of Botany.)

LEPIDOPTERANAE [LEPIDOPTERAE, P. C. S.]

LEPIDOPTEROSIUS, a genus of fossil insect flies, absent in the oolitic strata. (Agassiz.)

LEPIDOTA, a genus of fossil insect flies, absent in the oolitic strata. (Agassiz.)

LEPIDOSA, a genus of fossil insect flies, belonging to the oolitic strata. (Agassiz.)

LEPTA, a subdivision of the great family of fossil
devoted to the operations of the lustful passions on the charac-
ter of a man violent and unscrupulous in his nature, but under
the restraint of monastic vows. The young novelist drew the
character broadly and offensively; and the singular lubricity of
his performances, calculated by its baseness and admission to
the taste of novel readers to be extensively circulated, excited
much indignation. It is understood that the Society for the
Suppression of Vice applied to the Attorney-General to take
legal steps against the work, as a violation of his physical strength by
the author of his fame. At that time it was rather favourable to
the success of a work of genius that its morality was not per-
fected popular, and Lewis had the satisfaction of being a
much talked of and highly esteemed character as represented in his published letters, is singularly at variance
with that which might be derived from the study of his works.
He appears to have been good-humoured, simple, affectionate,
and not addicted to any vice. He had a very difficult part to
maintain in his intercourse with his parents, his mother having,
on account of her levities, long been separated from her hus-
band. Although he could not vindicate her conduct, he gave
her his kindest sympathies. It is a singular circumstance in
his life, that, after having lived for some time on bad terms
with his father, the latter dying in a temper which precluded
the son from any hope of succession, yet left him, with
slight exceptions, his whole fortune. This event made Lewis a
rich West India proprietor. He was very kind to his
slaves, and his occasional visits to his estates in Jamaica were
welcomed with great pleasure by the negroes. Though his portrait of the Emperor was
made of his own slaves and those in the neighbourhood of his estates. His
poetical pieces, including 'Alonzo the Brave,' 'Bill Jones,' &c., are well known: they are distinguished by the fluency of the
verses and the horror which they narrate horrible and
tragical incidents. There is, how-
ever, in all his writings, a tone of barbarous and exaggerated
taste. In 1812, he introduced to the stage the drama of
'Temour the Tartar,' which is said to have had much influence in
creating the taste for gorgeous pageants, from which the
British stage has for some years been struggling to relieve it-
self. Lewis died at sea, on the 14th May, 1818, when on the
way home from the West Indies, and is buried in St.
(Poonth and Correspondence of Matthew Gregory Lewis
8vo., London, 1830.)

LEYDEN, LUCAS VAN, a very celebrated old Dutch
painter and engraver, was born at Leyden in 1523. He was
first instructed in the arts by Hugh Jacobson, his father;
and afterwards by Cornelis Engelbrechtsz; and he distinguished
himself even as a boy by his engravings, and was a famous
painter as early as his twelfth year. He painted in ditemper
a picture of St. Hubert, in 1566, for a citizen of Leyden of the
name of Lokhorst, who was so astonished and grati-
fied at the excellence of the work, that he paid him twelve
guilder for it. He engraved, however, for the greater part time
doubtless a very large sum for a picture. Some of Lucas's
early engravings are highly prized by print-collectors, and
are possessed among the greatest rarities of their class: they
doubtless add more to their value, however, from the particu-
lar circumstances of their origin, than to any intrinsic merit
they may have. They are better as engravings than as works of
art. Vastu speaks highly of the prints of Luca d'Olanda,
as he is called by the Italians. He excelled in aerial per-
spective, but he was far surpassed by his two contemporaries,
Albert Durer and Marcantonio—in correctness of drawing
by the latter, and in execution and in drawing by the former.
Albert Durer visited Lucas at Antwerp in 1521, and he
makes the following note in his journal: 'I was invited
to dinner by master Lucas, who engraves in copper: he is a
little boy, but has a mind so exact that I have seen him
engrave during a journey which Lucas made through Zealand, Flanders,
and Brabant, for the sake of becoming acquainted with and
seeing the works of their various painters. The entry above quoted
for 1523, which mentions his engraving with great facility, is
fixed in my mind, and is the more so as it was from the
print of this journey six years earlier than the account of
Van Mander, who says that Lucas made it when he was about
thirty-three years of age, which, according to his own date of
Lucas, who was well to do in worldly matters, fitted up a
small vessel and sprung expressly for this journey; and at Middel-
burg, where he entertained the painters of the place with a
feast, he invited Durer to join him, and they made the excursion together, both
clad more like princes than artists. It was a succession of feasts,
and Lucas repeated the entertainment of Middelburg
at Ghent, at Antwerp, and at Mechlin. He, however, was
not less energetic in his pleasures than at his work, and he indulged
during this excursion in a round of dissipation which appears
to have lastingly injured his constitution: he was
never well afterwards. His own vanity led him to account for
his illness by the supposition that some of the women with
whom he had entertained had endeavoured to poison him, and he
added to his malady by indulgence and despondency. He
allowed his mind to fall into such a morbid state that his
health and strength rapidly decayed. He lived to the
last few years of his life in bed, or at least in the sick-
room, still, however, working at occasional intervals. He
died in 1565, aged only thirty-nine years.
Lucas's pictures are of course, they are in the old Flemish
style, but are among the best works of that school. They are
cleanest, expressively, deeply coloured, and executed with great
care; and are beautiful and highly interesting, notwithstanding
their Gothic forms and arrangement; in the perspective of
colour they are in advance of their time. The galleries
of Vienna, Berlin, Dresden, and Munich possess a few good
pictures by Lucas; his own portrait is in the Berlin Gallery.
There is a very small curious picture by him in the collection
of the Duke of Devonshire, at Devonshire House; it represen-
ta man having a tooth drawn, while a woman is picking
his pocket: there is a print of it, of the same size, by Lucas
himself, dated 1528. There is a picture also by Lucas at
Wilton House, and another at the Liverpool Institution.
Mr. Rogers, the poet, possesses a pen-and-ink drawing of the
portrait of the Emperor Maximilian, and which, according to Lucas
himself, is considered by some his best engraving. A picture of the 'Last Judgment,' one of his most remarkable works, is
still in the town-house at Leyden. The print of Eulenpiekels,
which was etched by the master after the four plates, which
are the rarest engravings in existence: there are said to be not more than
five or six of the original extant, but it has often been
copied, and the first copy was made in 1644 by Hondius,
when the price of the original, even at that early time, was
fifty fuchas; it is about six and a half inches high and rather
better than five wide, and represents a man playing the
bagpipes, with two children on his back, followed by a woman
who is also carrying a child, and is leant upon an arm supported
with two panniers in which are three other children; the
whole family is preceded by a small figure dressed in a cow,
with a stick in one hand and a jug in the other, an owl on his
shoulder, and a dog walking before him—this is Eulenpiekels;
it was engraved in 1520. Bartch, who published a
distinct catalogue of the prints of Lucas van Leyden, des-
cribes 174 engravings by him; in all, including wood-cuts,
his prints amount probably to about 2000.

(Van Mander, Het Leven der Schilders; Bartch, Cata-
logue Raisonné de tous les Estampes qui forment l'Œuvre de
Lucas de Leyde, and Peinture Groover, vol. vii.; Huber,
Manuel des Artistes, Stuttgart, 1825; Van der Meer, Geschicht
der Kupferstecher-kunst; Van Eynden and Van der
Willigen, Geschiedenis der Vaterlandische-Schilder-kunst,

LIBEL. [Libel, P. C.] The Act of 6 & 7 Vict. c. 96, entitled 'An Act to amend the law respecting defamatory
words and libel,' has made some alterations in the law of
defamation and libel. The Act commences with the preamble,
For the better protection of private character, and for more
effectually securing the liberty of the press, and for better
preventing abuses in exercising the said liberty, be it enacted,' &c. The Act enacts—§ 1. That in any section for
defamation it shall be lawful for the defendant, subject to a
certain notice in writing therein described, to give in evidence
in mitigation of damages, that he made or offered an apology
to the plaintiff for such defamation with which he was
charged without actual malice and without gross negligence,
and that at such time as the section mentions he inserted in such
newspaper or other periodical publication a full apology for
Lucas, or of the said libel, or of any other apology as in the said
section is more particularly described.
§ 2 enacts, That in any action for a libel contained in any
public newspaper or other periodical publication, it shall be
competent to the defendant to plead in mitigation of damages
the charge without actual malice and without gross negligence,
and that at such time as the section mentions he inserted in such
newspaper or other periodical publication a full apology for
Lucas, or of the said libel, or of any other apology as in the said
section is more particularly described.
§ 3 enacts, That if any person shall publish any libel upon
any other person, or shall directly or indirectly threaten to
print or publish, or shall directly or indirectly offer to prevent the
printing or publishing of any matter or thing touching any other person, with intent to extort
any money or security for money of any valuable thing from

by the circumstance of his becoming free that he became a citizen, though positive law, as among the Romans, might invest the degree in which he thereby obtained citizenship. (Curtius, P. C. S.) Slavery may and does spring from the growth of antiquity which were under monarchical or tyrannical rule; but he who was the slave of an individual in any such state, and obtained his freedom, did not thereby become a citizen, but was merely released from the duty that he owed to the lord of his person; the master: he still owed together with others the duty of perfect obedience to an individual monarch or tyrant.

The words liberty and freedom, in political terms, have always been used to express a condition of a people in which they are to some degree at least secured against the arbitrary rule of an individual or of a small number of persons; and the word slavery, in the same sense, is used to express the condition of those in which the mass of the people have not reasonable security for their lives and property against the capricious rule of one man or of a number of persons who form a small minority of the whole.

That which is really meant by political freedom and liberty is nothing more than a form of government which shall in some degree at least secure to the people the enjoyment of life and of their property against the tyranny of one man or of a few. Freedom and liberty then are terms which can only be applied to constitutional governments (Constitution, P. C.), and to republics, in the proper sense of that term. There is no political liberty or freedom under any other form of government, though under a monarchy, when the administration is good, there may be in many respects more personal freedom than there is in a pure democracy. But the essential quality by which a free government is distinguished from this: the sovereign power is not in the hands of one or a small minority, but it is either distributed among the whole community or a considerable part of it.

Political liberty does not exist in some civilized nations in Europe, in Prussia for instance. Political liberty does not exist in Russia. In some countries where it does not exist, it is the general opinion that its existence would be a benefit to the whole nation. In other countries the masses of the people are still in such a condition that political liberty could not exist, for political liberty, as already stated, means, that the sovereign power must be in the hands of a large number, and they must possess intelligence enough to enable them to exercise and keep the power; but there are nations where the mass of the people are too ignorant to exercise or keep any political power.

The highest degree of political liberty is in a Democracy (Democracy, P. C.): for it is that form of government which is furthest removed from a monarchy. The relationship of monarch and subject is the like relationship to master and slave.

A nation which strives for its liberty strives for a popular form of government, whether it be a constitutional kingly form or a true democratic liberty. A feeble form of liberty is but a feeble form of government. A strong nation has understood; and many who have cried out for liberty have either not considered exactly what it is they want, or they have supposed that liberty would free them from many evils of which they considered it to be a state of dependence. It is now generally admitted, that in those states where a large part of the population have equal political knowledge with the few, who direct administration, the general interests are best served by this large number participating in the government. Political liberty then, to some extent or degree, is, in many countries, necessary for securing the advantages of good administration. But there are many evils incident to states which are not due to the want of political liberty; and it is therefore a matter of importance for those who would make changes in government to consider whether the evils of which they complain are owing to the want of political liberty or to other causes.

The notion of political liberty has been based upon the analogy already pointed out between Political Liberty and Personal Liberty; which is a false analogy, though it has an historical one. Man, it has been assumed, is naturally free. No man is naturally or by nature another man's slave. As no man, it is said, is naturally a slave, so all mankind have naturally a right to be free. But government, it is said, arises from the consent of the governed.

On these assumptions rests the American Declaration of Independence: We hold these truths to be self-evident: that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness: that to secure...
these rights governments are instituted among men, deriving their joint powers from the consent of the governed, &c.

In this passage is the Pyrrhic Law, which is opposed to slavery; and it is on the assumption of the equality by birth and the endowment of all men with certain inalienable rights, that this instrument would found the American Political Liberty. He introduces the doctrine of the social contract, and assumes, as an historical fact, an origin of governments by consent of the governed. It was also promulgated in a country in which a very large number of people have always been slaves; and these governments have been constituted without the consent of the governed. These are real facts: those assumptions are untruths.

Political liberty rests on no such sorry basis as the Declaration of Independence places it on. That nation which can obtain it and maintain it is in a better condition than if it were politically a slave, even to the wisest of masters; and when it is able to obtain and maintain that liberty, it is right, or in other words it is for the general interest, that a nation should, by force if necessary, alter that form of government which is political slavery.

Plutarch promises to be most stable which is the growth of long time and the result of a perpetual struggle between a master and his slaves, in which the master has not ceased to be master all at once, but has always lost something in the contest.

That which is of sudden growth or is the offspring of Revolution, is often premature, and always insusceptible; for liberty so acquired may only be a step from a state of political slavery to a more wretched state; it may be a step from a state of slavery, mild and tolerable, to anarchy, which of all things is most intolerable.

The words Liberty and Equality often go together, and each of them in so doubtful a sense that one hardly knows what to make of them. Liberty is often used, apparently without people considering what they really mean, in the sense of freedom from restraint. But this kind of Liberty is inconsistent with Political Liberty properly understood; and all men's liberty of action is and must be restrained by positive laws in every well-ordered community. Every law that forbids any act directly or by implication abridges Liberty, and such abridgment is always a universal benefit when the law which so abridges liberty only abridges it in cases where it is useful to all that it should be abridged, and where the law is so framed as to accomplish that object. Equality, in its unlimited sense, can no more exist in any state than perfect individual liberty; for if each man is left to exercise his industry in the best way that he can, without interfering directly with that of others, some will be richer, and happier, and wiser than others. The only Equality that can be approached to in a well-ordered state is that Equality which is the result of a good policy, which policy, so far as it is consistent with political good, is to every citizen equal in the State the free enjoyment of his industry, wealth, and talents, imposes restraint on all alike, and makes all alike bear the burden of taxation and of the services due to the State. Further, it gives to so large a number as it can, consistently with the universal interest, an equal share in the sovereign power; but no policy that has ever yet been framed has ever given an equal share in the sovereign power to all the members of a community; such an Equality is impossible.

The Declaration of Rights published by the French National Assembly in 1791 contains the words 'free, equal, rights, liberty,' and many others, all of which are used in a meaning so remote from the meaning of the words so understood suggests.

Strange samples of nonsense have been examined and dissected by Bentham in his 'Anarchical Fallacies' (Bentham's Works, part viii., Edinburgh, 1818).

The word Liberties is often used to express those particular constitutional principles or fundamental laws by which political freedom is secured in a nation. The British parliament should attempt to maintain the triennial bills, the standing army, the habeas corpus, or the Habeas Corpus, an such an attempt would be called an attack on the liberties of Englishmen.

LIGATURES, in Anatomy, the organs by which the various articulations of the animal body are held together.
LIGHTS, ARTIFICIAL. Within the last few years many improvements have been made for the illuminating of apartments—by candles, by lamps, and by a sort of combination of both. The modes of illuminating large buildings have been most improved by the use of Gas, and Lamps, P. C. S.; and DRUMMOND LIGHT, P. C. S.; while the articles AROUND, P. C., and CANDLE, P. C., illustrated the common modes of domestic lighting. The recent inventions may be classed thus:—1. Candles; 2. Candle-Lamps; 3. Oil-Lamps; 4. Spirit-Lamps.

1. Candles.—Dr. Ure, in the Supplement to his Dictionary of Arts, describes the mode adopted by Messrs. Hempel and Blundell, for making candles of palm-oil, margaric acid, and stea-

ric acid or stearine. The palm-oil is melted in an iron pan, and then cooled gradually, by which it is separated into a liquid oleine or oil, and two solids, stearine and margarine. The oil being then boiled, the stearine is thrown out; the oil is afterwards mixed with quicklime, and the mixture is afterwards brought to a granulated state by the action of cold water. Muriate of lime and sulphuric acid are then employed to separate the quick-
lime from the stearine, after which the stearine is washed in water until it is cooled, and crystallized, are pressed, whereby the stearine is separated from the margarine. The two are separately bleached; and, having further reduced in size, until it assumes the form of a pure and solid kind of palm-wax or hardnaded tall, fit to make into candles in the usual way. The margarine, or margaric acid, obtained in this way, is mixed with common tall to make another sort of candles.

Palmer's candles differ in many points from those in common use. In a patent obtained for them in 1842, one of the arrangements was intended to make the wick bend out of the flame. This was accomplished by a tube let into the wick, and thereby render the troublesome process of snuffing unnecessary; this consisted in impregnating one side of the wick with common paste or starch, which gave a greater stiffness and less combustibility to that side of the wick than the other: this inequality of action gave a bending tendency to the wick. The same object is, however, now attained by having the wick in two halves, twisting spirally round each other; each half is bound round in a tolerably compact form; and the process of twisting the spiral, by the gradual burning of the candle, causes the tops of the two wicks to spread out, and so form a wick of large diameter. Another mode of introducing the wick into candles, and a small apparatus for preventing the guttering of candles, formed part of the patent of 1842.

The circumstance of palm-oil being in a solid state in our climate, coupled with the ascertained mode of separating it into three different substances, oleine, oleic, and margarine, has led to many suggested variations in the mode of making candles, by the mixture of one or more of these component substances either in the palm-oil, or afterwards. There have also been patents taken out for new varieties of wick, and for new forms given to the candle; but these do not involve any features which call for much notice.

2. Candle-Lamps or Oil-Lamps is a designation under which may be grouped many recent contrivances, having for object the burning of solid tallow or fat instead of oil, but without having the tallow formed into a candle.

3. Oil-Lamps.—One of the difficulties which have lessened...
The usefulness of common oil-lamps is the tendency of the oil to thicken in cold weather; while another lies in the imperfection of the means for keeping the wick well moistened with oil up to the verge of the flame. Both of these matters have exercised the ingenuity of the last few years. Dr. Ure remarks (p. 184), 'The great cost of light from superheated oillamps is the waste of stearic candles, as also the nuisance of the light from tall-lamps; they also have to the invention of an endless variety of lamps, of which the best hitherto known is a small copper or Carcel lamp, so generally used by the opulent families in Paris. In this lamp the oil is raised through tubes by clockwork, so as continually to overflow at the bottom of the burner, and yet circulate in the lamp while the excess of the oil drops back into the cistern below.'

There is a lamp called the Meteor lamp, having some of the properties of the Carcel, but intended to burn rape-oil. The internal arrangements of this lamp are curious and complicated. The lower part of the pedestal consists of a reservoir for containing the oil; and in this reservoir is a kind of piston or plunger, worked up and down by a nut and screw from the outside; the rising of this piston occasions the pressure or tightening of a coiled spring, and this pressure causes the oil to be forced up a central tube towards the flame. The admission and regulation of the oil to the lamp, the adjustment of the wick, the clearness of the lamp and for admitting draught, and of the gallery which supports the glass chimney, are all of an intricate kind, and, whatever may be their excellency while in good order, would render the repair, in case of accident, a difficult business.

One of the modes adopted for maintaining the oil in a liquid state, is by the use of a lamp constructed by Mr. Parker, in which the lamp is kept hot in a warm room. The whole of the oil is in a hot state. At a small distance around the tube which contains the oil, there is a hot pipe, and the space between the two tubes, of capacity sufficient to hold a pint, constitutes the reservoir for the oil. The oil is thus so near the flame, that it speedily becomes warm, by which its facility of burning is much increased. A slide-valve is opened to allow the oil to descend from the reservoir to the lamp. The intensity of the flame is modified by raising or lowering a wire, placed in the beam of light, and held by magnets. In a series of experiments on the illuminating powers of different kinds of lamps and candles, Dr. Ure found that the hot-oil lamp, with a given quantity of oil, gave a brighter light than any other form of lamp; or, the light being equal in intensity, the hot-oil lamp was the most economical. This corroborates, so far as it goes, the remarkable results obtained by the hot-blast in the iron manufacture.

Argand's principle of the mode of admitting air to act on the wick has been the one most generally followed since his time; and many of the subsequent inventions have had relation more or less to some modification of this arrangement. The Solar lamp, one of the earliest of this class, has so for some time been used in Paris, as in the Argand; but the action of the air on the exterior of the wick is more directly felt, the number of holes in the centre of a cap or cone, and the air is admitted to the flame close to the hole, and in a horizontal direction, while the flame is yet small; so that the exposure of the gaseous products to the action of the air in mixture is much more complete. Many improvements have been introduced from time to time; but the solar lamp remains in principle an Argand, with the addition of a cap or cone to the exterior, and the combustion more complete. Many of the modern variations in lamps and in gas-burners have had relation to this circumstance of admitting the external air to act at the points and in the quantity found best for the maintenance of the flame.

4. Spirit-Lamps.—In chemical experiments the spirit-lamp has long been a valuable piece of apparatus; but the use of spirit instead of oil, as a fuel for lamps intended for domestic purposes, is a modern innovation, and has led to much mechanical ingenuity in the construction of the apparatus.

The word spirit is rather a vague one, since there are many kinds of spirit, and may be used to be enough for this purpose; but the kind alluded to in the spirit-lamp of Turpentine, or that liquid which is distilled from common turpentine by being separated from the resin which is a component ingredient of the same; and hence the name for some of the modern spirit-lamps. Turpentine being a very abundant produce of the American states, camphene has been long in use in the United States for lighting shops and public buildings, and it seems to have been from that country that the practice was borrowed and introduced into England. When the import duty on turpentine was lowered two or three years ago, the price became reduced sufficiently to direct the attention of lamp manufacturers, and they have been substituting a substitute for oil. Many different forms of lamp have resulted from these inquiries; and different processes have also been adopted for freeing the turpentine from a small quantity of oxygen which is troublesome while the supply is added. Young's Vest, lamp is one of those varieties. In the specification of the patent it was stated that the lamp is constructed for burning rectified spirits of turpentine, or camphene; that, on account of the very fine and fiery nature of the liquid, provision is made for keeping cool the reservoir where it is deposited; that no tube or metal conductor of any description is allowed to pass into or through the liquid from the burning part of the lamp; that a non-conductor of heat is placed between the burner and the liquid; that the cotton wick hangs down from the burner into the spirit, so as to supply spirit to the flame by capillary attraction, without the intervention of any metallic or conducting substance; that the admission of air to the interior of the wick is managed without the necessity of passing an air-tube through the liquid. All these features and a few others are rendered necessary in the camphine or spirit lamps, on account of the very fine and fiery nature of the liquid; an incompatibility such that the arrangements for an oil-lamp would not be available for a camphine-lamp without much danger.

Whether these camphine-lamps receive the name of 'Vesta,' or 'Gen,' or 'Heron,' or 'Princess,' or 'Paragon, or any of the many which have been applied to them, they all present in common a reservoir, generally of glass, placed between the supporting parts of the lamp, the O-rings, which contain the liquid, and a cotton wick is suspended over the liquid. The chief points in which the several varieties of the lamp differ are in the arrangements for admitting air to the flame.

Of one of these lamps, the 'Vesta,' Dr. Ure states, that 'burning with its utmost brilliancy, without smoke, it emits a light equal to very nearly twelve wax or spermaceti candles of three or four to the pound; and in so doing it consumes exactly one halfpenny worth of camphene in six minutes (value sixpence) in ten hours; hence the cost per hour for a light equal to ten such candles is one halfpenny.' Since that statement was written, the demand for camphine has raised its price, and the relative advantages in its favour are therefore smaller; but it still remains much cheaper than any form of candle or oil-lamp, in relation to the quantity of light yielded. All lamp-oils contain some oxygen, which neutralizes a part of the hydrogen and carbon, and also some oxide or other substance which damps the brilliancy of the flame; whereas rectified camphine, being composed almost wholly of hydrogen and carbon, contains nothing but what is susceptible of combustion. Whether it be called a spirit-lamp, or a lamp of the feet combustion, and also so as to avoid danger, are questions for the manufacturer; but in a scientific point of view, camphine seems to be the best, and camphene, for the reason that it is not alone from turpentine that the spirit may be procured; for tar and naphtha also, if subjected to careful distillation and rectification, will yield a spirit or camphine differing but little from that yielded by ordinary spirit-lamps.

A few words may here be added concerning two important features connected with lamps, viz., the comparative illuminating powers of different kinds, and the means of carrying off the products formed by the flame.

Pectet, Dr. Ure, and Frye have all instituted experiments bearing on the former of these two questions. Pectet experimented on candles only. He determined what would be the value of different kinds of candles, sufficient to produce a given intensity of light, as determined by Carcel's lamp as a standard. They rank in the following order, the first being the cheapest:—tallow candles, six to the pound; ditto, of eight to the pound; pressed tallow; stearine; spermaceti; wax. This relation was as to price only; the relative weights of material consumed followed a different order of arrangement, the spermaceti and tallow being the least economical. In Dr. Ure's list ('Supplement to Dictionary of Arts') the relative quantities of light for a given price, or the relative cheapness of a given quantity of light, among several kinds of lamps, and also the relative advantages of the following order:

- Hot-oil lamp, with southern whale-oil.
- Carcel lamp, with sperm-oil.
- Hot-oil lamp, with sperm-oil.
- 'Gen' lamp, with cocoanut-oil,
French lamp, with spern-oil, mould tallow candles, Pale wax candles, stearine candles, cocoa-nut stearine, spermaceti candles, and wax candles, the first being, in point of economy, the cheapest, and the last the dearest.

Dr. Fyle's experiments ('Transactions of the Royal Scottish Society of Arts') seem to have been of a more extensive character, embracing a larger number of sources of illumination. Assuming a given intensity of gas-light as a standard, he experimented on ten varieties of candles, and found their relative cheapness in producing the given degree of light, to rank as follows: tallow with singlewick, cocoa, composit, palm, tallow with double wicks, wax, diaphene, margarine, spermaceti, and composition. In another table, comparing gas, oil, and candles together, he assumed Argand gas-flame as a standard of intensity and price, and gives the following arrangement in respect to the ratios of relative cheapness, the intensity of light being uniform:

| Argand gas-flame | 1:00 |
| Solar lamp | 1:04 |
| Naphtha | 2:00 |
| Solar oil in Argand lamp | 3:98 |
| Whale-oil | 5:00 |
| Spern-oil | 6:50 |
| Tallow candle (two wicks) | 12:70 |
| Cocoa candle | 13:10 |
| Tallow candle (one wick) | 14:50 |
| Composition | 15:50 |

According to this table, composition candles are nearly thirty times more expensive for an equal intensity of light.

Dr. Faraday has introduced an important arrangement for carrying off the products of combustion in gas and oil lamps. This arose out of a complaint, on the part of the members of the Athenaeum Club, that the air of their library was vitiated and the binding of the books injured by the lamps then used. Dr. Faraday investigated the subject, and shortly afterwards communicated to the Institute of Civil Engineers the mode which he proposed to adopt for removing the evil. In a paper communicated to this body (Session 1848) he adduced striking proof of the magnitude of the product resulting from combustion. Oil and gas each contains carbon and hydrogen, and each reduces the same volume of oxygen to bring about combustion. The light is one of the indications of the intensity of this union; and the substances which result from it are mainly carbon, by a combination of some of the oxygen with the hydrogen; and carbonic acid, by the combination of more of the oxygen with the carbon. The quantity of these two substances produced, owing to the enormous absorption of oxygen during the combustion, would by many persons be deemed quite extraordinary. A pint of oil, when burned, produces a pint and a quarter of water, and a pound of gas more than two and a half pounds of water; the increase of weight being due to the absorption of oxys more than the atmosphere, one part of hydrogen taking eight parts (by weight) of oxygen to form water. A London Argand gas-lamp, in a closed shop-window, will produce in four hours two pints of water, and a pound of oil also produces nearly three pounds of carbo acid, and a pound of gas two and a half pounds of carbonic acid. For every cubic foot of gas burned, rather more than a cubic foot of carbonic acid is produced.

As the water produced deadens the effect of the flame, and as the carbonic acid is very deleterious to the lungs, Dr. Faraday contrived a contrivance confining both off allowing them to pass with the air of the room. Air is admitted to the flame, nearly in the usual way; but when the products of combustion have arrived at the top of the glass chimney, the air is entirely cut off from the chimney and the air of the room, so that they are compelled to pass down between the chimney and another larger glass chimney concentric with it. The open space between the two chimneys communicates with a pipe which is conducted in any convenient way into the open air; the carboxylic acid, aqueous vapour, smoke, and other emanations from the flame have no means of escape except through this tube, and their effect is thus wholly cut off from any contact with the air of the room. The mode of carrying out the arrangement may be varied in its details; but the general result is said to be that the light is brighter, the space around the lamp cooler, and the air of the room less vitiated than when common open burners are used.

Ligozzi, JACOPO, a distinguished Italian painter in fresco and in oil, was born at Verona, where he was studied under Paolo Veronese. He established himself at Florence, where he had much influence upon the painters of his time, especially in colouring, for though not equal to Grand Velasquez, Ligozzi was of the first rank and possessed the same gift for the same time that he added vigour to the colouring of the Florentines, he improved his own drawing. The Grand Duke Ferdinand II. appointed Ligozzi his principal painter, and superintendent of the Imperial Gallery. He died in 1697.

Ligozzi is the painter of several great works in oil, though they are what the Italians call quadri di macchina or machines, that is ornamental or decorative works, distinguished chiefly for their size and effect on the spectator. The following works, however, are of a superior order of this class—San Raimondo resuscitating an infant, in Santa Maria Novella; the four crowned Saints,—St. John the Baptist,—Gli Scalzi, or the barefoot friars, at S. Marco; and the Martyrdom of St. Dorothea, at the Conventual Friars, at Pescia. Ligozzi executed also many small highly finished easel pictures. Augustin Caracci engraved some of his works.

Ligustrum, a genus of plants belonging to the natural order Jasminaceae. It has a feathly, the berry containing two membraneous or compressed nuts. The calyx is short, tubar, four-toothed; the corolla of the flowers is white and spreading; stamens 2, with short filaments. The species are shrubs or low trees, natives of Europe and Asia.

Ligustrum, Common Privet, has elliptic lanceolate glabrous leaves; compound racemes; sweet-scented flowers, white at first, soon changing to a reddish brown. The berries are dark purple, almost black. It is a bushy sub-evergreen shrub, growing in hedges and thickets in Great Britain, and native of the South-west of England. This plant was formerly called Prim, or Prim(sqrt), from its being used for verdant sculptures, or topiary-work, and for primly cut hedges. The common English name Privet seems to have been given to it from its being frequently planted to conceal private places. In German, Dutch, Danish, and Swedish it is called Ligistrum; in French, Troène; in Italian, Liguostro; in Spanish, Alhena; and in Portuguese, Alhena. It is probably the Ligustrum of Theophrastus, 'Hist. Plant.' 1, 14. In point of utility and ornament few shrubs exceed the privet. Its chief use is to form hedges either for shelter or ornament. It bears cutting well, and it is not liable to be destroyed by rabbits has numerous roots, and robs the ground less than almost any other shrub. It is one of the few plants that will grow in the smoke of London; it also thrives under an abundance of moisture. The wood is hard and fit for timber. From the pulp of the berries a colour pigment may be prepared; with the addition of alum they dye wool and silk of a good durable green. The following varieties are those found chiefly in our gardens:

- L. v. nivosecarpum, the white-barberry privet.
- L. v. corniculatum, the yellow-barberry privet.
- L. v. chlorocarpum, the green-barberry privet.
- L. v. sempervirens, the Italian privet.
- L. v. variegatum, the variegated-leaved privet.
- L. v. angustifolium, the narrow-leaved privet.
- L. v. × lasianthum, lisanthes tomentose leaves, white flowers, and very small brown berries. It is a native of China, near Canton.
- L. Japonicum is a native of Japan, with oblong ovate grooved leaves, and white flowers growing to the height of six or eight feet.
- L. prostratum has elliptic acute leaves, hairy beneath, as well as the branchlets. Flowers crowded, almost sessile, spicate, disposed in threes, hairy, having the minute bracts. It is an evergreen shrub, native of Nepal, on mountains, growing from six to eight feet in height. All the species of Privet are of easy culture, and will grow in any soil, whether rich or poor. L. lucidum requires some protection in the winter.

(From, 'Gardener's Dictionary'; Babington, Manual of British Botany; Frans, Synopsis Plantarum Classica; Loudon, Encyclopedia of Trees and Shrubs.)
LILAC. [Syringa, P. C.]
LILIUM (the Latin Lilium, and Greek Lépis, a genus of plants the type of the natural order Liliaceae. It has a perianth of six leaves spreading or reflexed, with a longitudinal groove facing the axis, a bulb, a smooth corolla, a petal of a beautiful shining white on their inside, ridged and not quite so transparent or luminous on their outside. The flowers are large, white, and in a cluster at the top of the shoot. The species early in the summer has been cultivated in our gardens from time immemorial. Great doubts had existed respecting the native habitat of this species, till Mr. Hawkins, the friend and companion of Dr. Slothrop, found it growing wild in that classical and celebrated spot the Vale of Tempe. It is the ssp. of Theorouc (Id. 23) and of Dioscoreides (3. 106). Both Pliny and Ovid have added their testimony to the general admiration in which this plant has been universally held. The flowers have a pleasant sweet smell, and were formerly used for medicinal purposes, particularly as an antiepileptic and anodyne. A water distilled from them had reputation as a cosmetic, but the odorous matter is so exceedingly volatile that it is impossible to preserve it, as it is wholly carried off by evaporation. The roots only are found available in medicine, and they are frequently employed as emollient poultices, owing to the mucilaginous nature with which they are encased. Whether they are also useful for the treatment of the eye, it is not possible to determine, whether they are more efficacious than poultices formed of bread or farina. Gerard prescribes the leaf internally in dropsy, and for this purpose bread was made of barleymeal mixed with the leaves, and eaten for two or three days, for a considerable length of time. This species, as well as others, is cultivated in Siberia and eaten as the potato. The scent of the leaf is exceedingly powerful, and peculiarly distressing in some cases. Murray mentions an instance of death ensuing from exposure to the odour of this plant.
L. bulliflorus, Bull-bearing or Orange Lily, has linear-lanceolate leaves, a bell-flower, a smooth erect corolla, glabrous and rough on the inside, without any scent. The bulb is composed of numerous thick white loosely imbricated scales. This species and L. chalecolemonis is probably the ssp. of Theophrastus, Hist. Plant, 6, 6, and undoubtedly the ssp. of Dioscoreides, 3. 127. It is a native of Italy, Austria, and North America.
L. superbum, Superb Martagon Lily, has a revolute corolla, the lower leaves whorled, the rest scattered. The flowers form a branched reflexed pyramid, and are large and handsome, of a yellowish red, with dark red spots; their smell is disagreeable. The bulb is as white as ivory. It is a native of North America, whence it was imported by Mr. Peter Collinson in the year 1736.
L. helicoid, has white spirillic lanceolate leaves, pubescent scabrous stem, nodding flowers, and a reflexed perianth. Though not a native of Great Britain, it is naturalised in copses in many places.

The species enumerated are those most commonly cultivated in our gardens, each of which has many varieties and sub-varieties. They are capable of being propagated by planting the offsets of the roots, and by sowing seeds to obtain new varieties. Every year the roots produce many offsets, which, however, unless greatly wanted, are best left on for two or three years. The proper time for separating them is in summer or autumn, when the winter has decayed, either by taking them from the mother bulbs in the ground or removing the whole and dividing the offsets from the main bulb when uncovered; they should then be planted in beds a foot or three inches deep, to remain a year or two; the large roots set again in the borders singly.

The sowling of seed is chiefly practised to obtain new varieties of Martagons; it should be done in the autumn, soon after the seed is ripe, in pots or boxes of rich light earth, with holes in the bottoms half an inch deep; the pots or boxes should be placed in a sheltered position during the winter and refreshed oftentimes at first with water; the plants will flower the following year; and should be transplanted into nursery beds in flat drills an inch deep and three or four inches.

After having grown in this situation till the August or September following they should be again transplanted into another bed, and at greater distances; after which they may be finally removed into the pleasure-ground. The bulbs should be planted singly, as they soon increase by offsets into large bunched. All the species and varieties of Liliaceae are valuable as plants of ornament for the flower and rock garden, to fill and beautify the borders, and the scenery at gardens and country seats; they are proper for the pleasure-ground, and if planted with judgment, succeed each other in blooming upwards of three months. The common white lily, the orange lily, and marbled lily are very showy. The orange-lily answers well for small gardens and confined situations in towns and cities.

(Dahlgren, Manual of Brit. Botany: Fras, Synopsis Plantarum Flora Britannica, and British Flowers, which has been edited by Mr. Hodgson.)

LIMBURG, a town in the province of Liege, in the kingdom of Belgium, situated in 50° 40' N. lat. and 6° E. long., on the Wesel (Wesere). It is a fortified town with two gates, on a mountain, at the foot of which is the suburb of Dalhem or Dolham. This suburb is larger than the town; both together have 3000 inhabitants, who manufacture a considerable quantity of fine linen. There are marble-quarries in the neighborhood. The railroad from Brussels to Aix-la-Chapelle passes near Limburg.

(Hassel, Handbuch; Stein, Lexicon.)

LIMBURG ON THE LAHN, situated in 50° 29' N. lat. and 6° 8' E. long., in the province of Nassau. It is the seat of a Roman Catholic bishop. It lies on the river Lahn, over which there is a stone bridge. It has a mint and four churches, of which St. George's Church is deserving of notice. The inhabitants are engaged in the manufacture of earthenware, and carry on a considerable trade in the productions of the country.

(Cannabich, Geography; Stein, Handbuch, by Hörselmann.)

LINA'BRIA (from Lina, flax, owing to the similarity in the leaves), a genus of plants belonging to the natural order Scrophulariaceae. It has a 5-parted cup, yellow or copper-colored corolla, the lower lip 3-fid with a prominent palate clasping the mouth. The capsules open by valves or teeth at the top. The species are annual or perennial plants, very rarely small shrubs, and there are usually 5 lobes, which are round, sparsely racemose at the tops of the branches.

L. Cymbalaria, iry-leaved toad-flax, has roundish heart-shaped leaves, 5-lobed and glabrous; the stem is procumbent, slender, and rooting. The flowers are solitary, axillary upon long stalks, and of a pale blue colour. It is a native of Europe, chiefly on old walls. It grows abundantly in Italy and Sicily, and is found in Great Britain. There are several varieties of this species.

L. Elatine, balberted-leaved toad-flax, has ovate hastate leaves, the lower ones ovate, the peduncles glabrous, stem procumbent; and the spur straight. The flowers are solitary, on long slender peduncles, yellow or brown, the spur hairless, and the stem procumbent. The appearance of this plant is similar to the last, but the flowers are larger, and the whole plant not so slender. It is native throughout Europe in corn-fields, and is found in Great Britain.

L. pulchella, known by its racemose flowers, which are of a dark purple colour with darker veins. It is native of the south and middle of France and of Great Britain.

L. repens, is distinguished by its lanceolate sepal and angular seed with transverse elevated lines. The flowers are of a bluish colour, the stem erect, branched, and leafy. The seeds are much smaller than either of the following species. It is found on calcareous soils, particularly near the sea, in Great Britain, in a town in the district of Cork, in Ireland; it is also native of Switzerland, Italy, and Hungary.

L. vulgaris has ovate acute glabrous sepal, shorter than the capsules, and the spur. The flowers greatly resemble
LINCOLN, PORT. [SOUTH AUSTRALIA. P. C. S.]

LINDSAY, SIR DAVID, a Scottish poet, was born at Garmynol, in Haddingtonshire, about the end of the fifteenth century. He inherited from his father the estate of "The Mount," in Fifeshire, whence, to distinguish him from many others of the same name, he is usually called Sir David Lindsay of the Mount. In the year 1512, he was appointed ser-
vior, or gentleman launer, to the young prince of Scotland, afterwards James V. His duties seem to have been of the most servile kind,—he had not only to attend the person of the infant prince, and see that he was properly attended to, but also to have himself exercised the craft of nursing. He says,

When thou wert young, I bore thee in my arm And on thy back, though ill thou didst grumble, And in thy bed off haply thee warm, Wrote thee in thy manhood ever so sickly; Some time in daubing sorely I fang, And sometimes playing fuses on theloor, And sometimes on my own taking care.

There is little doubt that his genius and good-humour must have made him a very animated and delightful companion to his charge. He seems never to have been entranced with the education of the prince, which was placed in the hands of a much graver personage—Bishop Gavin Dunbar. Lindsay's name is connected with a curious and poetical incident. He is the authority on which his kinname, Lindsay of Pitscottie, in his "Chronicles of Scotland," describes a spectral apparition which, in 1513, appeared to James IV, in the church of Linlithgow, and warned him against that campaign which terminated so fatally in the battle of Flodden. Sir David professed to have seen the apparition approach and vanish, and described him as "one man clad in a blue gown, belted about him with a roll of linen cloth, a pair of bootkins on his foot to the great of his legs, with all other clothes con-

The 'Dreme,' supposed to be the earlist of his writings, appeared in 1528; it is a satire on the times, representing a vision of the punishment of the prevailing iniquities in the other world, and is looked upon as a part of the Papage. 'Complaint of John the Commonweal'; 'History of Squyer Meldrum'; 'The Monarchie'; and 'The Play, or Satire, on the Three Estates.' There is little sentiment or pathos in Lindsay's work. In his "Joces of Joces," his principal quality. All that was powerful in the country came under his lash, and it is one of the most inexplicable circumstances in literary history that he should not have been the victim of his audacity. He particularly excelled in his attacks on the priesthood and the corruptions of the court; and after the Reformation his name was long popular as that of a relentless champion. The Satir has on the Three Estates stands half way between the Satiri of the fifteenth century and the latter part of the sixteenth century. It was sometimes acted in the open air, and could not have failed strongly to excite popular feeling against the corruptions, civil and ecclesiastical, which it undertakes to expose. Last, the preservative proof,' says Sir Walter Scott, 'of the liberty allowed to such representations at the period, that James V. and his queen repeatedly witnessed a piece in which the corruptions of the existing government and religion were treated of with singular justice and striking effect. Another feature that makes the circumstance of Lindsay's performances having such an audience, seem strange to those of our broad indolent habits, is the certainty that he was certainly beyond that of the other writers of the age, for 'Davie's say,' as he was long called in Scotland, seems to have had an innate liking for what was improper. His 'Squier Meldrum' is the most concise history of adventure, some of which exhibit a very loose and dangerous morality. Lindsay held the office of Lord Lyon King at Arms. In 1587 he has the task of preparing some masques or pageants to celebrate the arrival of Mary of Guise, queen of James V. The time of his death is not known, but it is said to have been alive in 1567.

(Lord Lindsay, Lives of the Lindsay; Irving, Lives of Scottish Poets.)

LINDSEY, REV. THEOPHILUS, was the youngest son, by a second marriage, of a respected merchant, and pro-

prietor of salt-works, residing at Middleton, in Cheshire, where he was born June 20, 1728, Old Style. His mother having some connection with the family, by whom he was so much respected, as Misses, was the daughter of Lord Belasyse, Baroness of Selina, Countess of Huntingdon, stood god-father for him, and gave him his baptismal name. Lindsey entered St. John's College, Cambridge, in 1741; and, after taking his degrees, he was elected fellow in 1747, about a twenty-third year, he commenced his clerical duties at an episcopal chapel in Spital Square, London. He then became domestic chaplain to Algemren, Duke of Somerset, and after his death, travelled for two years on the continent with his son, subsequently Duke of Northumberland. On his return, about 1755, he was presented to the living of Kirkby Wiske, in the North Riding of Yorkshire; and in 1756 he removed to that of Piddington, in Dunstable, where he lived, and the Prince of Wales, for whose child he was nurse, received additional strength from the commencement of an intimacy with the Rev. William Turner, a presbyterian minister at Wakefield, and Dr. Priestley, then a dissenting minister at Leeds, both of whom he was entertained by. He had a great love of learning, and was a man of excellent judgment, but, for reasons explained at some length by his principal biographer, on his own authority, he did not deem these a sufficient obstacle to the renewal of his assent to them on en-
tering a new life.
for the maintenance of Unitarian worship. His published ‘Apology’ having been attacked in print by Mr. Burgh, an Irish M.P., by Mr. Bingham, an by Dr. Randolph, Lindsey replied to it in 1776. In 1778, he answered the last of these writers. In 1781 he published ‘The Catechist, or an Inquiry into the Doctrine of the Scriptures concerning the only True God, and object of Religious Worship’; in 1783, ‘An Historical Account of the State of the Unitarian Church and Separation from the Reformation to our own times’; with some account of the obstructions it has met with at different periods; an elaborate work, which had been several years in preparation. In 1784, the baptism of Michael Robinson of Cambridge’s Pleas for the Divinity of our Lord Jesus Christ, by a late member of the University. The work to which this was a reply had appeared several years before, by Dr. Priestley, in a form of address to the students of Oxford and Cambridge; and this was followed in 1790 by a ‘Second Address to the Students of Oxford and Cambridge, relating to Jesus Christ, and the origin of the great errors concerning him.’ In 1782 he invited Dr. Dibney, then the left the Establishment Church on the same grounds as he had done himself, to become his colleague in the ministry at Essex Street, and in 1783, on account of age and growing infirmities, he resigned the pastorate of the church based on his objections to a well-drawn up and revised edition, the fourth, of his liturgy. He never continued to reside at the chapel-house, as did his wife after his death. In 1789, he married, with an evangelical preface, the ‘Letters to a Philosophical Unbeliever,’ which Dr. Priestley had recently published in America in reply to Paine’s ‘Age of Reason’; and in 1800 he republished the long and continued the writing of his works, on the knowledge which he had amassed, in such a way that the Hebrews had of a future state. Lindsey’s last work was published in 1802, entitled ‘Conversations on the Divine Government,’ showing that everything is from God, and for good to all.” He died on the 3rd of November, 1808, in his eighty-sixth year, and was buried at Bunhill-fields. Copious biographical notices of Lindsey were published in the ‘Monthly Repository’ and ‘Monthly Magazine’ of December, 1808, the former being by Mrs. Catherine Cappe, with whom he had lived on intimate terms when in Yorkshire, and the latter by Mr. Joyce; and in 1812 the Rev. Thomas Belsham published a thick octavo volume of ‘Memoirs,’ in which he gives a full analysis of his works, and extracts from his correspondence, together with a list of his publications, which embrace, besides those above mentioned, several single sermons and two volumes of his ‘Memoirs’ shortly after his death. The amusing autobiographical ‘Memoirs’ of Mrs. Cappe, published in 1822, also contain many notices of Lindsey. A portrait of him accompanies Belsham’s ‘Memoirs.’

LINEAL DESCENT. [Desmont, P. C.] L’INGEGNO. [Lucio Andrea di, P. C. S.] LIPARI. [Descomoli, P. C. S.] LIPPO, a celebrated Italian painter and one of the most distinguished of the Quattrocentisti, was born at Florence in the year 1412. He was the son of Tommaso Lippi, who died when Lippi was only two years of age; his grandfather’s name was Guido Lippi. His mother died soon after he was born, and he was brought up by his father’s sister Mona Lappipc, until he was eight years old, when she placed him in the Carmelite convent Del Carmine, to commence his education. Here he showed the inclination for study and so great a propensity for scribbling figures and other objects in his books, that the prior came to the wise conclusion of having him educated for a painter, then an occupation in which he had the least inclination; but this was assuaged when he assumed the life of a monastic life. Filippo was accordingly permitted daily to visit Masaccio, who was then employed in painting the chapel of the convent, and he took extreme delight in contemplating the frescoes of St. Peter, which were destroyed; and he worked on other works in various parts of the convent and in the church Del Carmine, each work superior to its preceding, and so like those of Masaccio that his spirit was said to have passed into Filippo. All these works however, or at least what remained of them, were destroyed in the conflagration of the church in 1771.

In 1430, or when only seventeen years of age, Filippo gave up the convent life, and returned to Florence, where he was taught by Andrea del Sarto, and by Simmaco and Donato de' Panni, and to Ancona. Here, while on an excursion of pleasure at sea with some other young men, he was captured by a pirate and carried in chains to Africa, and there sold as a slave. Eighteen years later, in 1448, he escaped and returned to Florence; and one of the first works which he executed at this time was a small picture of the Assumption of the Madonna, for the wife of Cosmo de’ Medici, which is now in the Imperial Gallery at Florence.

Fra Filippo executed many excellent works at Florence, Fiesole, Arezzo, and at Prato. While engaged in 1459 in the convent of Santa Margherita, in the last named place, he met with one of the nuns, carried off Lucrezia, daughter of Francesco Buti, a young Florentine lady who was being educated at the convent; and he had a son by her called Filippino Lippi, who became well known as a celebrated artist. Filippo was dead in 1456, aged only forty-five. The death of San Bevignate, celebrated for the cathedral of Prato, is one of Lippi’s finest works; it is in oil and on panel, and is still in the cathedral. The passages also from the lives of John the Baptist and St. Stephen, painted in fresco, in the choir of the same church, from 1456 to 1464, the figures of which are colossal, are among the best works of the fifteenth century: Vasari terms the martyrdom of St. Stephen his masterpiece. Fra Filippo has introduced his own portrait into this piece, and he has painted that of Lucrezia Buti as Herodias in one of the series from the life of the Baptist. These frescoes were recently restored by a painter of Prato of the name of Marini.

Fra Filippo died at Spoleto in 1469, aged 57; this is not doubt the correct age of Filippo, though Vasari by his carelessness has done much to obscure the matter. In his first edition he states that Filippo died in 1483, aged 67, and in the second, in the same year aged 57; but 1483 is evidently a misprint for 1458; and, from Filippo’s connection as a boy with Masaccio, he cannot have been 67 when he died, but may very well have been 57. The facts mentioned in his Life: the year of his death, however, was 1469, as discovered by Baldinucci in the Necrology of the Carmelites. But Baldinucci and all other writers have overlooked another one of the evidence connected with Masaccio, and have assumed 1400 to be about the time of Filippo’s birth, whereas Masaccio himself was born only in 1402.

The pupilage of Filippo to Masaccio, or his works, is the subject of another fact, hitherto in doubt, namely, the time in which Masaccio executed the frescoes of the Carmine, supposing they were all painted at one period. Vasari says they were painted after Masaccio’s return from Rome, and after the recall from exile of Cosmo de’ Medici, which took place in 1434. But the ‘Consecration of the Church of the Carmine,’ in the cloister, was painted before Filippo left the convent, because Filippo painted his picture of the Consecration of the Church of the Carmine at a Columbus interval by the side of it; and, as said above, he left the convent when only seventeen years old; at the latest, therefore, in 1430, when Masaccio may have been twenty-eight years of age. The frescoes of the Consecration were finished by Filippo himself, and not left unfinished by himself, as some of those as also may have been completed before 1430, as Masaccio died before they were all completed, it is probable that he was engaged in this convent at two distinct periods of his life. Filippo himself was about 30 and Masaccio himself about 45 and some of those also may have been completed before 1430, as Masaccio died before they were all completed, it is probable that he was engaged in this convent at two distinct periods of his life. Filippo himself was about 30 and Masaccio himself about 45.
It may be added that, if the particles of a substance be, by the abstraction of caloric, made to approach still nearer to one another, the attraction of affinity will exceed the force of repulsion; and there will be constituted a solid body, which may be crystallized or not according as the particles approach one another gradually or otherwise: in the former case they may arrange themselves in such positions as to become connected together in one direction by the aces at which the attraction is the greatest; while, if the approach is rapid and is accompanied by agitation, the union of the particles may take place irregularly.

The particles of a liquid are held together with considerable force notwithstanding their freedom of motion, since a small quantity of a liquid has a tendency to take a spherical form when at a distance from any substance for which its particles have greater affinity than for another; this is very evident in mercury, oil, and water, the first of which on being suffered to fall on a table immediately divides itself into globules, and the others take a like form when a small quantity of either is suspended from a pointed extremity of any object.

The dilatations of water and mercury by the application of heat, as well as the remarkable fact that the expansions of water are equal at temperatures which are at equal distances above and below about 39° (Fahrenheit's scale), have been noticed under THERMOMETERS, P. C. But the expansions of any liquid, at different temperatures, for equal increments of caloric, are not equal to one another; and the following table of expansions, in volume, for an increment expressed by 1° (Fahr.), is abridged from that which is given by Dr. Young in his Lectures on Natural Philosophy (vol. ii. pp. 392, 393):

Water (Sp. gr. = 1 at the maximum density).

From the experiments of MM. Dulong and Petit, the mean expansion of mercury, in volume, for 1° (Fahr.) between the temperatures of freezing and boiling water, is expressed by 0.00105; between the freezing-point of water and 397° (Fahr.), by 0.00102; and between the freezing-point of water and the temperature at which mercury boils, by 0.00105.

The expansions are expressed in parts of the original volumes of the liquids; and the corresponding linear expansions, in parts of the length of a column of the liquid, may be obtained with a sufficient approximation to the truth on dividing each of the above numbers by 3.

The phenomena of molecular action in liquids are mentioned under Capillary Attraction, P. C.; and the state of our knowledge on that subject is noticed under Thermometers or Measure-ability, P. C. S. For the specific heat of liquids, or their capacity for caloric, see Specific Heat, P. C. S.

LIS PENDENS. [NOTICE, P. C.]

LITHOGRAPHY. PRESS. In the article Lithography, P. C., a reference was made to Press for an account of the press used in lithographic printing; but this account was accidentally omitted.

The mode of printing on a lithographic stone does not differ very materially from that adopted with copper and steel.
plates. A direct downward pressure, such as is used in typo-
printing, would not produce all the required effects: the action necessary being rather a kind of rolling than a direct pressure.
In the lithographic process, the beginning of this art, the plate was composed of a hollow table for holding the stone, covered with a tynampanum or stretched parchment; the engraved stone was inked by rollers, the paper was laid down on it, and the tynampanum was brushed over it; the paper, and a bar of wood was pressed firmly on the tynampanum; the stone, by the action of the levers, was made to traverse from side to side beneath this bar, so that every part of it in turn experienced the pressure of the bar.
All the parts of the apparatus have since undergone improve-
ment and modification. Messrs. Taylor and Martin's lithographic press has two cast-iron uprights rising from the bed or table; and there is a carriage for containing the stone, which carriage is supported on rollers moving along a mini-
ture railway. The scraper or bar, instead of being pressed down, is governed by a handle, which keeps it closely in contact with the tynampanum. A cylinder, worked by a handle, sets the carriage in motion, and the stone is thus brought in all its parts under the action of the scraper or presser. The different parts of the apparatus are ad-
justed to different requirements of the art by regulating screws.
Other machinists have improved the press in various ways; but the general principle of the apparatus may be inferred from these few details.
LITHORNIS. A fossil bird from the Isle of Sheppey is thus named by Owen.
LITHOPERMUTUM (from λιθος, a stone, and περμυς, a seed; in reference to the hard seeds or nuxa), a genus of plants be-
longing to the natural order Boraginaceae. It has a deeply cut calyx in five segments, a funnel-shaped corolla, with a naked or minutely five-sealed throat. The filaments are very short; the stamens included in the tube. The nuts are smooth or tubercular, stony, and attached by their truncate flat base to the bottom of the calyx.
L. officinale, Gromwell, has an erect much-branched stem, lanceolate acute veined leaves with tubercles and adpressed bristles above, hairy beneath; the throat of the corolla has minute scales within, and is of a pale yellow or greenish yellow colour, with a style, hairy and very hard, three or three ripening in each calyx. They were esteemed in ancient times as an infallible lithonthropite; their virtues in this respect are, however, entirely imaginary. This species is native of the United States and North America. It is found in dry and stony places in Great Britain, but sparingly.
L. purpureo-carolanum has herbaceous stems, the barren ones prostrate and creeping, the others erect. The leaves are lanceolate, acuminate, of a dark green, with crenate margins. The flowers are showy and large, at first red, and afterwards of a bright blue. The nuts are white, highly pol-
ished, and hispid. This species has no scales in the throat of the corolla, but merely five longitudinal downy folds. It is native of middle and south Europe, of the Caucasus in woody mountain places, and of England and Wales in chalky soil.
L. arvensis, Bastard Alkanet, has an erect branched stem, lanceolate leaves rather acute, hairy, and subcordate; the calyx a little shorter than the corolla; the nuts tubercular, wrinkled, polished, and of a pale brown. The throat of the corolla is destitute of scales, as in the former species. The flowers are white or yellow. It grows in clay soil on old walls, and in the banks of waysides. It is an annual plant.
L. officinarum furnishes a drug, the herbaceous short-stemmed, the leafy stems, slender lanceolate leaves, the lower ones oppo-
site; the calyx is shorter than the tube of the corolla, con-
ving when bearing fruit. It is native of Egypt and the island of Cyprus, and has the habit of an annual, being unknown in our temperate zone. It is the Lithocharum or Semifolium of Pliny, 27. c. 74. L. acutissimum is the Derris semiarvensis of Dioscorides, 4. 199.
All the genera of the Lithocharum are noted for the sturdy hardness of their pericarp, which have thebrittleness and taste of porcelain. This membrane when analyzed is found to con-
tain nearly 60 per cent. of earthy matter, which is more than is known in any vegetable body. According to Boner, L. officinale is the only true Lithocharum, none of the other species having a crown of scales in the throat of the corolla. The perennial and herbaceous species are plants of very easy cultivation, and the seeds are easily propagated by seed, which may be sown in the open ground. The annual species should be treated as greenhouse plants, and the shrubby kinds may be grown on rockwork or on wall-
tops, where they will maintain themselves if allowed to scatter their seeds. They do very well in pots among other alpine plants, and cuttings may be rooted under a hand-
glass. In general they are however short-lived and apt to rot.
(Don. Gardner's Dictionary; Birmingham, Manual Bril.
BoL.; Burnett, Outlines of Botany.)
LIVERWORTS, or LICHENS, a family of plants be-
longing to the class Cryptogamia, of which a definition is given under Fungi; there are about sixty genera, which are divided by Fries into four sub-orders—Hymenolitidi, Gasterolitidi, Lichenolitidi, and Conolitidi; to these some systematists add Byzaceae. In Etvans' British Flora of S. J., the Lichens are divided into several tribes, each tribe comprising several genera.
Several species of Lichenese are characterised by having an open disk, and being destitute of an hypothallus. It embraces the genera Usnea, Evernia, Roccella, Ramellia, and Cetraria. Several species of Usnea are known by the common names of Jupiter's beard, Tree-boat, &c. on account of their hair-
like appearance. They are amongst the most common of the Lichenes which cover the trunks of old trees, and give to them a picturesque appearance. U. plicata is a common species on old trees, park palings, &c., and has been recom-
Inged as a remedy in hooping-cough.
The species of the genus Evernia are common in Great Britain. One of these, E. procarnari, has a peculiar power of imbibing and retaining colours, and on this account is in much request as an ingredient in perfumed cushions and sweet pots. It has been recommended as a remedy in vegetable affections. It is frequently found on the oak and other trees. Evelyn says of it, 'This very moss of the oak that is white composes the choicest cypress-powder, which is esteemed a fine badge.' Bennett commonly uses under that name, as they do the fungi for the true agaric (excellent for hemorraghes and fluxes), to the great scandal of physic.' It is said that E. uspinus is poisonous to wolver, hence its name, but little is known of its real properties.
The genus Ramellia is found associated with the last two on the trunks and branches of trees, especially of the fir, the birch, the oak, the maple, and the hawthorn. Lightfoot says that the R. scopulorum 'will dye a red colour, and promises in that intention to rival the famous Lieben roccella or argol which is brought from the Canary Islands.'
For the properties and uses of the species of Roccella and Cetraria see Orchil, P. C., and Cetraria, P. C. S.
The tribe Parmeliaceae is characterised by a horizontal thallus. To it belong the genera Polypersona, Sistea, Borrera, Parmelia, &c.
Two of the species of Peligeria, P. caudina and P. aphthosa, have been used in medicine: the former as a remedy in hydrophobia; the latter is boiled in milk and administered in the thual.
The species of Parmelia are exceedingly numerous; one of the most common throughout Europe is the P. parietina, yellow moss. The thallus and shields are both of a yellow colour; and Lightfoot says, 'It is affirmed to die a good yel-
low or orange colour if mixed with alum.' It has also a very bitter taste, which has caused it to be used as a tonic in medi-
cine, and it has been recommended as a remedy in intermittent fever. It is the plant on which the famous Edward Cudbear. [Parella, P. C.] P. Parella affords the sub-
stance known as Lirutus, or Leucmus. [Lytmus, P. C.]
One of the species of the genus Sistea, S. pulmonacea, has been used as a substitute for the Iceland moss. [Cetraria,
P. C. S.] It is used in Siberia for giving a bitter flavour to bear. It is a native of Great Britain, and is found on the roots of old trees, especially when dying, and on old pales.

The tribe Loc(<i>e</i>)a embraces the important genus <i>Cladonia</i> [C(ladonia), P. C. S.], and also <i>Cpasacco</i> and <i>Sevophoros</i>, which are often among the subgenus of <i>Cladonia</i>. The <i>S. pyrriadiis</i> and <i>S. coccifer</i> are elegant lichens, having their apothecia elevated above the thallus in the form of little cups, those of the latter species being coloured scarlet. They have both been used in medicine as astringent and febrifuge.

The tribe S(<i>p</i>)hakorphenes contains the genera <i>Sphakorphenes</i>, <i>Fuscarea</i>, and <i>Isidium</i>. They are an exceedingly elegant group of lichens, but the species have not been much used for economical purposes. <i>Isidium</i> corollinum is said to be rich in colouring matter.

The genus <i>Kendycarpus</i> and <i>Porina</i> belong to the tribe <i>Kendycarpus</i>. The species of the former genus are found on rocks and stones, whilst those of the latter are interesting as forming distinguishing marks between various kinds of lichens used in medicine. The species of the tribe <i>Heterocarpus</i> have been used to apply a knowledge of the various species of lichens to the distinguishing not only between the bark of different species of <i>Cinnchona</i>, etc., but also between good and bad qualities of the drug.

The principal genus of the tribe <i>Verrucaria</i> is <i>Verrucaria</i>, of which the species are very numerous. [<i>Verrucaria</i>, P. C. S.]

The tribe <i>Graphidales</i> is remarkable for the forms which the apothecia assume, bearing a resemblance to the letters of Eastern alphabets. This may be seen in <i>Ographes</i> scripta in Fig. 7 of the woodcuts illustrating the article <i>Lichens</i>, P. C. As an indication of the value of the lichens in distinguishing the various species of <i>Cinnchona</i> bark, Fée states that the <i>Graphis interrupta</i> is only found on the bark of <i>Cinnchona</i> inoxifolia. Although the study of the lichens on the official barks has not produced all the advantages anticipated by Fée, there can be no doubt of its value in many cases. Referring to this subject, Burnett observes, 'Until the publication of Fée's memoir on the cryptogamic epiphytes of the official barks, the study of the <i>Ographes</i> and their allies seemed to be one rather of speculative amusement than of practical utility. But now the case is wholly changed, since these graphic plants, these living letters, written by Nature's hand, are shown to constitute inscriptions legible by men. Always curious indeed, and admirable even to the least tained eye, did the examination of these mimic characters appear; and as fancy traced the likeness to various Oriental signs, so were these little plants called Scriptura-wroes, some <i>erniarum</i> (apparently Sinegoitys), and so forth. But, like the hieroglyphs of the Egyptian nations, their meaning was buried in obscurity, and so little guessed at, that it often was doubted whether they had ever been recognized by the lichenologists as wiser than wisdom, until the Young and the Champollion of the vegetable world arose, and by means of a natural Rosetta-stone deciphered these letters unknown mean characters, and taught us to 'persue this part of the sacred Scriptures of creation.' (Burnett, <i>Outlines of Botany</i>; Lindley, <i>Natural System</i>; Lindley, <i>Flora Medica</i>; Fries, <i>Lichenographia Europaea</i> re-foct.)

LIVERMEN OF LONDON. [LONDON, P. C. J

LOCK, a kind of secret fastening in which a moveable piece, termed a bolt, may be projected by the action of a separate instrument, called a key, introduced into the lock in such a manner that it cannot be returned to its original position, so as to release the door, cover, or other article to which the lock is applied, excepting by another application of the key. While, however, the above appears to be the distinguishing characteristic of a lock, there are many locks in which the bolt is projected by the action of a spring, without the aid of the key, and in which it may be drawn back upon one side of the bolt to which it is applied by means of a handle, although it cannot be moved from the other side without the application of the key. Many such locks fall under the general denomination of latch or latch-locks. In other locks, again, there are two or more bolts, one of which only is under the control of the key, the others being moved by handles, while in another class of locks two or more bolts are shot or

Fig. 1.

*2 E 2*
Locomotively used, the keys, which are all represented as the pipe or tubular make, being presented to the eye endways. Of the three a, b, and c, are adapted for key-holes of various corresponding forms, while e and f, though suitable for key-holes of the same general form as the bit a, admit of further security by forming projections upon the sides of the key-holes, which rest upon the plate of the lock, to fit the notches and grooves cut in the sides of the bit. The next and principal means of security of the first class mentioned above is the use of pieces of iron or brass of various forms, fixed within the lock in such a way that no key can be turned round within it unless corresponding notches or slots are cut in its projecting bit. Fig. 2, which represents a portion of the interior of a lock in isometrical projection, with the bit end up, shows how the face of the hole, will illustrate this. The tinned surface in this cut represents part of the back-plate of a lock with a tubular key turning upon a central pin in the plate. Attached to this plate are two concentric prominent rings, of different degrees of elevation, one of which, for the sake of variety, is represented as complete or unbroken, while the other is cut away for a small space at the under side. These prominent rings are the wards, or, in technical language, wheels, which impede the introduction of a false key.

It is obvious no neutral key could be put into a lock provided with them as in the cut, unless a slit or notch were made in its bit to correspond with the larger and more prominent of the two rings, and this is equally evident that, although it might be put into the lock, the key could be turned round without having also a notch to correspond with the smaller and less prominent circle, which, being cut off from the key-hole, could not be discovered by an inspection from the outside of the lock. In the commoner kind of locks the wards seldom form a complete circle, but their effect is the same if they occupy only a small segment of it. They are commonly made of thin sheet iron, riveted to the plates of the lock, but locks with similar wards of copper are made for use in cellars, and other places exposed to damp, where iron wards would become rusty. A thicker kind of ward, known as solid wards, formed by casting in brass, and finished in the lathe, is used in many superior locks. The above cut represents wards of the simplest possible shape, which require nothing but a simple straight notch in the key to fit them. Many wards, however, are of a more complicated character, such as what are termed L, T, or Z wards, from the resemblance of their sectional form to those letters respectively. The keys must, of course, be cut of a corresponding form, by which the difficulty of imitation is greatly increased.

By referring to the various forms of key represented in Figs. 3, 4, 5, and 6, the peculiar advantages and defects of that principle of security which depends on the use of wards may be readily comprehended. The first and greatest defect of the system arises from the circumstance that, in ordinary cases, it is not absolutely necessary that a surreptitious instrument should perfectly thread the mazes of the wards. Thus the form and arrangement of the wards in the three keys marked g, h, and i, Fig. 3, is so different, that none opposite plate of the lock, and requiring notches in that part of the bit of the key which is represented by the slender connecting piece in the skeleton. Such is the case in all the keys represented in Figs. 4, 5, and 6. In Fig. 4, 1 represents a key for a solid-warded lock, which might, however, be easily picked by a skeleton key resembling r. The greater complication of the wards in w, Fig. 4, increases the difficulty of picking; while by the adoption of the arrangement shown at m, Fig. 4, the difficulty of introducing a false key is made perhaps as great as possible, since no instrument that does not thread all the intricacies of the wards could answer the purpose. This form, however, requires a very accurate workmanship, and unavoidably weakens the key to such an extent that it is in danger of breaking in the lock. All the keys hitherto represented, as well as those in Fig. 6, are pipe-keys, adapted for such locks as have a fixed pin or ax, and can only be opened from one side. It is, therefore, of no consequence that the wards attached to the back and front plates of the lock should resemble each other. In ordinary door-locks, however, in which the key may have to be inserted from either side, it is essential that the wards attached to the two plates, if such be used, should either be precisely similar, or should bear such a relation to each other that notches may be cut in both sides, or rather edges of the same, or, as it is sometimes called, the sect, of the key to suit both sets of wards, it being a necessary condition that the two sides of the bit, marked a and b in the cut, Fig. 5, should be perfectly alike. In such locks there is, very commonly, an intermediate plate, which enters the opening marked c in the annexed figure, and which carries, on one or both of its sides, the principal wards; and in many cases the bit of a key divided by such an opening may be considered as constituting a double key, of which only one-half is used at one time, that half being either a or b according to the side through which the key is put into the lock. Such is in some measure, the case in the key from which Fig. 5 is drawn; although, as it is the key of a tumbler lock, both halves are brought into use at once, whatever may be the direction in which the key is turned. When, however, the key is applied from the outer side of the door the part marked a moves the tumbler and b the bolt, while when the key is put into the lock from the inner side a moves the bolt and b the tumbler. The combinations of wards are intended to explain the theory of master-keys, which was early understood by the ingenious locksmiths of Wolverhampton. In Fig. 6 the wards of the keys o, p, and q are so far different from each other that neither of these three keys would open the lock designed for either of the other two, but a key formed like r would readily open any of the locks of the other three, or any other of a more extensive series, or suit, of locks constructed on the same principle.

One defect of the principle of security by wards is that, however complicated they may be, an ingenious picker will mostly be able to detect their form and position, by inserting a blank key with the bit covered with wax or tallow, so as to receive an impression of the concealed obstructions in the lock. It is well to observe, however, that it is very common practice to cut more notches in the key than there are wards in the lock, so that the complex appearance of a key is no certain
proof of the secure construction of the lock to which it belongs. Indeed some of the commonest locks are manufactured without wards at all, although the keys are invariably made as if wards were employed.

As above stated, some contrivance is necessary to keep the bolt steadily in the position in which it is left by the key; and in locks which depend upon wards for their security, this is usually effected by means of a spring, as illustrated by Fig. 7, which represents the interior of a small cupboard lock, with the bolt, a b, half shot, or in a position intermediate between locked and unlocked, and could be either backward or forwards by the action of the bit of the key at c in a curved hollow formed in the lower edge of the bolt. The end a of the bolt is divided into two parts, shooting through separate hollows in its lock; the top part of the bolt carries a long elastic piece formed by nearly separating a stout lamina of metal from the body of the bolt, and giving it an inclination to diverge from the bolt at the end b; and the lower edge of the bolt, behind the curved part acted upon by the key, is indented with two deep notches, b and d, with a smooth convexity between them. The opening in the back rim of the lock through which the end b of the bolt passes, is so small as to compress the spring with considerable force. If, therefore, the key be so applied as to shoot the bolt forward, the reaction of the spring will cause the notch b to hold firmly on the edge of the rim, from which it cannot be disengaged without raising the bolt, and compressing the spring, so as to allow the convexity between b and d to pass over the edge of the rim, after which the notch d will hold on the rim in like manner. The necessary raising of the bolt and compression of the spring is properly effected by the action of the key, but as it may be effected by pressure upon the end of the bolt, the security of locks in which such an arrangement is adopted, which are called back-spring locks, is inferior to that of locks in which the next breath of our subject, in the means of retaining the bolt in its position, as well as from the defects already explained as incident to the use of wards.

We pass naturally from the consideration of the back-spring and take up that of the lock, or method of opening it. The second principle of security, which consists in the use of moveable impediments to the motion of the bolt, and which may be applied, as an additional security, to locks in which the most ingenious arrangements of wards is employed to prevent the access of a false key to the bolt. Fig. 8 represents, side by side with our figure of a back-spring lock, a similar lock provided with a common tamper. In this figure the bolt a, b, though shot backwards and forwards in the same manner as that of Fig. 7, has no spring, or notches to catch on the back rim of the lock, to hold it in any required position; but it is provided with two notches in its upper edge, a and d. Behind the bolt is a piece of metal called the tumbler, pivoted to the plate of the lock at f, and continually forced downwards by a spring which presses upon its upper edge. The tumbler, which is visible above the bolt, is distinguished in the cut by being covered with a light tint, while the shape of the lower part, which is concealed by the bolt, is indicated by dotted lines. At the angle a the notch, which is visible above the bolt, is fully shot, falls into the notch d, and holds it firmly until, by the application of the key, the bit of which reaches the lower edge of the tumbler, the tumbler is lifted up to the position shown in the figure, at which position it will remain unless the further turning of the key shoots it back, when the stud of the tumbler falls into the notch c, and again secures the bolt. It is obvious that so long as the tumbler remains in its proper position, the bolt can neither move backwards nor forwards by the pressure upon its ends; and also that the lock cannot be opened by any pick or false key unless its bit be so formed as to reach the tumbler as well as the bolt. To render this more difficult, the tumbler is placed on the back of the bolt, so as to be acted upon by a step formed on the bit of the key; while further complication and security may be obtained by the use of two or more tumblers, which may be acted upon by different parts of the key. The necessity requisite in the length of the bit forms a strong recommendation of even the commonest tumbler locks; for if the bit be ever so little too short it will not lift the tumbler out of the bolt, and if too long it will not enter the curved portion of the bolt.

According to Mr. Ainger, the principle of security by tumblers, though of comparatively modern application in this country, has been known to the Egyptians in a very primitive period. In the lock now commonly used in Egypt and Turkey, the bolt is secured by a number of pins, which, though contained at other times in holes or sockets in a solid piece through which the bolt slides, fall into holes in the bolt when it is shot. This contrivance is illustrated by the annexed diagram, Fig. 9, in which a is a part of the bolt, capable of sliding through the solid piece b, in which are a number of hollows, c, c, c, each containing a moveable pin. As it is only by a sectional diagram that these pins can be represented, they are drawn as if all were in one straight line, which, however, is not the case in practice. In the present position of the bolt the pins rest upon its upper surface, and offer no impediment to its motion; but if the bolt be slid forward until the holes, d, d, come under the pins c, c, c, the lower ends of the pins will drop into them, and the bolt will consequently be held fast. It can only be released by the application of a kind of key which has a series of fixed pins exactly corresponding with the holes in the bolt, and which, being introduced into the bolt by the hollow or cavity e, is pressed upwards in such a way as to lift the pins clear of the bolt. The security arises from the concealment of the obstacles to the motion of the bolt, and from the circumstance that, supposing a person to obtain a correct impression of the holes, it would be difficult to ascertain the exact length necessary for the pins of the key. If too short they would not raise the pins clear of the bolt, and if too long they would enter the holes in the solid part above the bolt, and so impede its motion. This kind of lock, Mr. Ainger observes in the 'Encyclopaedia Britannica,' appears to be extensively, or rather universally, employed, for gates of towns and palaces, and houses, as well as for the smallest articles of furniture. The evidence of its alleged antiquity is derived, he adds, according to M. Denon (in whose magnificent work on Egypt it was published), from the circumstance of finding one of the bas-reliefs which decorate the great temple at Karnak, from which also it was ascertained that during forty centuries the lock had undergone no sensible change.'

Notwithstanding the high antiquity of the tumbler principle, its first important application in this country appears to have been made by Barron, in 1774, according to most of the authorities, or if not, section to the 'Encyclopaedia Britannica.' In the simple form of the tumbler represented in Fig. 8, there is the disadvantage that, while it effectually prevents the removal of the bolt unless the tumbler be raised high enough, it presents no obstacle to its removal when, by the use of a false key, the tumbler is thrown up beyond the proper degree. This defect is remedied in Barron's lock, and in many more recent contrivances with which we shall deal upon it, by the use of several tumblers, each of which requires to be raised to a different degree, and any one of which, if lifted too high, will form as effectual a barrier to the motion of the bolt as if it was not lifted at all. To illustrate this, let a, Fig. 10, represent a tumbler pivoted at b, pressed downwards by the action of a spring, not shown in the cut, at c, but
is raised precisely to such a degree as to bring the horizontal portion of the H-shaped aperture opposite to the stud, so that the stud, which fits it accurately, may slip through it. Fig. 11 shows the tumbler raised to this position, and the bolt half shot. When fully shot the tumblers are raised and the stud is seated in the division notch of the H-shaped aperture which lies nearest the end of the tumbler; and an equal security is afforded against any attempt to return it to its first position by any key which does not fit the proper height. Several such tumblers may be placed in one lock, the whole being mounted upon one pivot; and if the horizontal connecting portion of the H-shaped aperture be placed at a different elevation in each, each will require to be raised to a different degree to allow the stud of the bolt to pass. These different degrees of motion are provided for by variations in the curved portion of the lower edge of the tumblers, against which the bit of the key acts, and by dividing the end of the bit into a series of steps and notches, each acting upon a single tumbler.

Chubb's detector lock, the original patent for which was obtained in 1818, though an important improvement upon it was secured by a second patent in 1824, is one of the most celebrated locks made on the principle above described. Its peculiar merit consists in the addition of a lever, called the detector, which is so fixed that, while it does not affect the bolt at all under ordinary circumstances, it cannot fail to move so as to drop a catch into the bolt if any one of the tumblers be lifted a little too high, as some of them must inevitably be by any attempt at picking the lock. By thus fixing the bolt immovably, it not only renders useless any further attempt at picking the lock, but also gives notice of the attempt which has been made, when the proper key is next applied. By very ingenious contrivance the proper key is enabled, after lifting all the tumblers to the proper degree for shooting the bolt, to release the detector by a peculiar movement, and thus to restore the lock to its usual state.

In Bramah's lock, which was invented and patented about 1784, the principle of tumblers or moveable obstacles is applied in a very different manner to that above described, and the use of wards is entirely abandoned. In a kind of presatory record which was attached to his specification, and is quoted by Holland, Bramah alludes to the insufficiency, for the purpose of security, of all contrivances of the ward, or fixed obstacle character, not only on the grounds above noticed, but also because, according to Holland's abstract of his argument: 'the variations capable of being made in the disposition of such wheels or wards, and in the form of the key's bit, are not sufficient to produce the required number of locks, without having large quantities exactly alike, and their keys capable of opening one another reciprocally; in consequence of which they become a very imperfect security against violation, as any ill-disposed person might, by furnishing himself with a number of old keys, be enabled to open almost all the common locks in the kingdom with as little difficulty as if he had in his possession the key belonging to each lock.' In devising a remedy for these defects, Bramah contrived a method of supplying a more effective protection in a very different manner, as shown in Fig. 13, which is the common locks in the kingdom with as little difficulty as if he had in his possession the key belonging to each lock.' In devising a remedy for these defects, Bramah contrived a method of supplying a more effective protection in a very different manner, as shown in Fig. 13, which is the
further edge of each of these sliders, however, is cut a notch of such size and depth, that if it be brought to the same level as the bar b b, the bar will be capable of sliding through it. These notches in the sliders, shown by 1, 2, 5, and 4 in the diagram, are cut at various degrees of elevation, so that, in order to bring them all to tally with the bar at once, it is necessary to enable it to slide through them, each slider must be lifted up to a certain degree, different from the elevation of either of the others. As, however, the lower ends of the sliders, which pass through the bottom of the frame a, a, and which are the only parts of the apparatus intended to be visible, have a uniform degree of projection, it is impossible to tell how high they must be lifted in order to make its notch tally with the bar; and this can only be done by the application of an instrument resembling that marked g in the figure, in which are a series of slits, d, e, f, and g, corresponding with, and capable of fitting on to the lower ends of the sliders e, d, e, and f, and each slit being cut to exactly such a depth that when the instrument, or key, is put upon the ends of the sliders, and pushed up until its lower end comes in contact with the bottom of the frame, its corresponding slider will be raised to the degree necessary to make its notch tally with the bar b b. While the key, g, is held in this position, the bar b b may be slid backwards or forwards; but the instrument in its original position, and the key is withdrawn, the sliders fall, by their own weight, into the position represented in the cut, and the bar is again held fast.

In order to explain how the principle of security illustrated by the above intrinsic contrivance is applied in Brahah's lock, we must premise that the ordinary mode of depressing the key, in the action of the bit of the key, is entirely abandoned in it; the office of the end of the bit being performed by a stud attached to the end of a cylindrical barrel which is mounted in the lock, and which contains all its essential parts; or, rather, all the parts essential to its security. Fig. 14 represents this barrel, of the actual size, drawn from a street-door latch-look, the central figure being a side view of the barrel, and the others representing its back and front ends. The circle at a, in the side and back views, represents the stud by which, when the barrel is caused to revolve on its axis, the bolt is moved as by the bit of an ordinary key. This revolving motion is imparted to the barrel by the insertion of the proper key, which is represented in Fig. 17, and which has a very small bit adapted to the square notch at the back of the head of the front end of the barrel; but the barrel is prevented from revolving by the stud shown in Fig. 15, but arranged, for convenience, in a circular form within the barrel. In this modification of the apparatus, the barrel, which contains four sliders radiating from its centre or axis, and having a motion in the direction of its length, represents the frame with its series of vertical sliders; the sliders, instead of being kept in their ordinary position by gravity, are continually pressed forward to the front or key-hole end of the barrel by a helical spring; and the bar b b is represented by a circular plate of steel, represented of the actual size in Fig. 15, which is cut in two halves by a division shown in the cut at top and bottom, and is inserted, by its inner edge, in the slit or opening b b in the barrel, Fig. 14. The four notches in the inner edge of the plate are thus placed upon the edges of the four sliders in the barrel; and as the plate is screwed by a nut shown in Fig. 15 at its two sides to an immoveable part of the lock, it follows that the barrel cannot be turned round unless the four sliders are so far pushed forward that their notches may all tally with the edge of the plate, Fig. 15. Fig. 15 is a longitudinal section of the barrel with the end of the key as applied to bring the sliders into the required position for allowing the barrel to turn; and Fig. 17 represents, at a in profile, and at b an end view, the key itself separately. The key, being tubular, is put upon the fixed central pin or axis, shown in Fig. 16, the four radiating notches in the end of its pipe fitting, at the same time, on to the ends of the four sliders, which are shown in Fig. 14. These sliders, two of which are shown white in the section, Fig. 16, are, in the absence of the key, kept pressed against the front of the barrel by means of a collar which slides upon the central pin or axis, and is pushed forward by a helical spring which surrounds the pin, and abuts upon the back plate of the barrel; but when the key is pushed into the lock it is in contact with the sliding collar, compresses the spring, and allows each slider to be pushed forward to a degree exactly proportionate to the depth of that notch in the key which acts upon it. By this means the deepest of the three notches represented in the side edge of each slider is brought to tally with the edge of the circular plate, which is represented detached in Fig. 15, and shown edgeways, at b b in Fig. 16, and thus all impediment to the rotation of the barrel is removed, and consequently, by moving the key, the barrel, with its stud a, may be caused to revolve, and to shoot the bolt just as an ordinary key would do. When the barrel is returned to its original position, the key is withdrawn, and the action of the spring restores the sliders to their original situation, in which they lock into the notches of the circular steel-plate, and keep the barrel stationary.

In order to render the above description as simple as possible, we have omitted in it several minor points which tend to the security and efficiency of the lock. The whole of the apparatus above explained is securely enclosed in a turned brass box, so that even the ends of the sliders are only visible at the farther extremity of the deep and narrow section, the centre of which is occupied by the end of the pin or axis, which, projecting considerably beyond the sliders, greatly increases the difficulty of bringing any false instrument to act upon them. The end of the key, the main use of which is to cause the barrel to revolve whenever the key is turned, forms also a stop to prevent it from being pushed in too far, and to indicate when the sliders are brought to the proper position. To prevent the sliders from sliding too far, or from dropping too far into the barrel, in advance of the key, when by the compression of the helical spring they are released from its influence, they are made of a thin piece of metal doubled, as shown at c, Fig. 17, so that their inner ends, having an inclination to spring open, press with sufficient force against the sides of the grooves in which they slide to keep them in whatever position the pressure of the key may place them, until such pressure is withdrawn, and they are exposed to the counter-pressure of the helical spring. The portability of the key constitutes a great advantage of this kind of lock, as a key which may always be carried in the waistcoat pocket, or even enclosed to a watch-chain, is least likely to be mislaid, or to fall into the hands of improper persons, than a large key. Again, both locks and keys, being made almost wholly by machinery, may be made with great accuracy at a moderate cost, when the production of a false key from an impression of the true key, or even from the key itself, would be no easy task to a person not possessed of the requisite machinery. The two additional small notches represented in the tumblers of Fig. 16 and 17, to which allusion has just been made, add greatly to the security of this kind of lock. For some time after its introduction it was deemed absolutely inviolable, but ingenuity at length overcame the difficulty of picking it. This was accomplished by what is termed the tentation, or trying, process. Force being applied to the barrel in such a way as to give it an inclination to revolve on its axis, the picker tried all the sliders in succession,
to ascertain which of them, by the inevitable inaccuracy of workmanship, pressed with most force against the circular locking-plate. This slider he then gently pushed until, by the play of its own perpendicular, the center of the lock being secured in the required position, when, having secured it, he proceeded to adopt the same course with each of the other sliders in succession. Thus, by an extraordinary exertion of his strength, and the dexterity of his hands, the lock-keeper was able, in many instances, to accomplish the apparently impossible feat of picking a Bramah lock. No sooner, however, was this fact made public, than an efficient remedy was provided. This was a device, named Russell's establishment, by the simple device of cutting one, two, or more additional or false notches on each slider, and enlarging, as shown in Fig. 15, the inner portion of each notch. This renders it utterly impossible for a picker to know whether he gets the true notch, or one of the false notches, on the edge of the locking-plate, while, supposing him, against all probability, to find the right notch in a majority of the sliders, the fact of one only hanging on a false notch would be sufficient to prevent the barred from turning, owing to the depth of such notch being insufficient to clear the plate. The enlargement of the notches in the locking-plate, which allows of a degree of motion far exceeding any which could arise from mere inaccuracy of workmanship, adds to the baffling effect of the false notches, by the use of which the Bramah lock may be fearlessly said to be rendered, so far as it is practicable, absolutely safe from picking. The same principle of picking, and the same kind of expedient for security against it, with variations of detail which need not be noticed here, have been applied to turning a true key and a false key into the possession of one picker.

The infinite variety attainable in the manufacture of locks on this principle forms one of its great recommendations. Our illustrations refer to one of its simplest forms, in which only four keys are used, but even in this form the variety attainable, without any difference in the size of the key or the diameter of the central pin, is very great. By the use, however, of five, six, or seven sliders, the number of different locks, each of which may have the same external appearance, but can be opened only by its own proper key, is increased almost to infinity. Bramah himself showed that if twelve sliders were employed and number of changes which might be produced by simply varying their relative positions, would amount to 479,001,500; while adding one more slider the number would be increased to 6,227,019,500; so that, as he observes, 'one lock, consisting of thirteen of the above-mentioned levers, sliders, or other moveable parts may (by changing their places only, without any difference in motion or size,) be made to require the same immense number of keys to open it; and, it is observed that in this case the lock is lost, or the owner desiring, on any account, to have a lock altered, it is possible to change the relative positions of the sliders, so as to render the old key useless; and also that many locks are made, if requiring to be constructed in a new set, or set of locks alike in everything but the position of their notches, and then applying to each of them in succession the intended master-key, which must have notches different to any of the ordinary keys, and cutting new additional notches in the sliders to suit it. Such, indeed, is the principle upon which the notches of ordinary Bramah locks are cut, the key not being fitted to the lock, but made first, and having its notches cut by a machine which provides for a continual change in their order and depth. This done, each key is applied to a separate lock, with blank or uncut sliders, and the notches in the sliders are cut while they are thus held in the proper relative position to the key. By any arrangement would be almost impossible to secure the requisite accuracy.

Owing to the very small size of the protecting apparatus, the Bramah lock has been applied to many ingenious purposes—to which kinds of locks can be made, suitable, among which we may notice the locking of liquor-cocks. Mr. Russell's contrivance for this purpose is referred to under C. P. C. 3. 885, and we see no reason why, for small cock, a note of the present contrivance may not be adopted, in which the revolving barrel of the lock should be attached to, and indeed form the upper part of, the revolving plug of the cock itself, so that a single motion of the hand should be sufficient to open and to open the arrangement would have this advantage, that it would be impossible, by inadvertence, to leave the cock unlocked, since the act of turning off the liquor would both lock it and, by the force of the spring, so far eject the key that it could only be looted the lock by design. In the forty-eighth volume of the 'Transactions' of the Society of Arts (part. i. p. 182) is a paper by Mr. S. Mordan, who has gained much celebrity by the many improvements he has made on this apparatus, on a curious application of this invention to what he calls a "lock-protector," which is, in fact, a scuttle, or shield, adapted to cover the key-hole of a room door, and barring in the key. This scuttle is attached to the door by a lever, the protecting this scuttle to a key-hole on the outside of a door, and turning its key a quarter round, two lanced-shaped pieces of steel are projected from a little box at the back of the scuttle, which is inserted in the door, and which enter the opposite sides of the key-hole, and to hold the scuttle so firmly in its place that nothing short of the application of violence can remove it, until, by a fresh application of the little key, the shield is thrown open. The benefit of such contrivance is to enable travellers at innns to prevent their chamber doors from being opened in their absence, by closing up the key-hole.

A lock was invented by Mr. Kemp, of Cork, in 1816, in which the peculiarities of both Barron's and Bramah's locks are combined in such a way as to afford, in the inventor's opinion, greater security than can be attained by either alone. In this lock, which he calls the union lock, a number of pins or sliders, which detain the bolt much in the same way as the sliders of Bramah's lock detain the locking-plate, are acted upon by the ends of a series of tubes, of various lengths, which are inserted in the hollow of the key. In this way, the key must necessarily be placed in the possession of the key. This kind of key, its inventor justly pleads, must be far more difficult to imitate than either Barron's and Bramah's, so that it affords greater security against any attempt to produce another like it. Mr. Robert, of Hebert, in noticing this invention, observes, that until a complete remedy is provided against the possibility of copying or imitating keys, the art of lock-making is imperfect, and no locks are secure, and he adds, 'a key must be in his possession a lock the key of which cannot be copied—a locksmith possessing no tools by which an exactly similar one can be made.' The machine by which the original one was made, he adds, is so precisely made as to be destroyed in producing another like it. The lock is very simple and strong, and, he says, be manufactured cheaply; but as the inventor was waiting for an opportunity of bringing it before the public, Hebert gives no account of its construction.

As a means of security somewhat differing from any of the above, and affording certain advantages peculiar to itself, we may here notice the permutation or combination principle, of which the simplest application is in a kind of padlock often termed a puzzle-lock, which opens without a key, but is regarded rather as an ingenious toy than as an available substitute for a padlock. The simplest form of a key being turned, with the intention of opening a padlock, with the intention of opening a padlock, is one of the most common forms of locks a bar, with square or other projections from one or more of its sides, is slipped through a series of circular plates or discs, each of which is capable of being turned, and the ordinals of the holes through the centres of these circular plates, discs, or rings, are fitted in such a manner that unless the whole of them are turned round to the extent position which they occupied when the bar was slipped in, it cannot be withdrawn. To provide for bringing the rings to this position after they have been disturbed from it, the periphery of each is marked with a series of letters or numbers, a certain predetermination of combination of which, should be known only to the possessor of the lock, must be brought into a straight line by turning the several rings round with the thumb and finger. As the number of combinations which may be effected, like the number of changes in the arrangement of the letters or numbers in the above-mentioned padlock, is almost infinite, while only one combination will enable a person to open the lock, a high degree of security may thus be attained. The essential defect of this arrangement is, that the secret of the lock must be known to the person who made it, and is liable to become known to persons from whom it is desirable to secure the lock. The Marquis of Worcester, in whose Century of Inventions' second edition, a great number of locks are described, in which the most marvellous properties, are enumerated, would appear, from the seventy-second article in the Century, to have devised an improvement upon this apparatus, as he refers to it in an abstract as an escape. The properties of which he describes as being that the owner, though a woman, may, with her delicate hand, vary the ways of coming to open the lock ten millions of times beyond the knowledge of the smith that made it, or of me who
Invented.' The details of this invention are not given, but in the third volume of the 'Transactions' of the Society of Arts, 1794, the description and representation of an escutcheon of similar character, invented by N. Marshall, and rewarded by the Society in 1781, in which the escutcheon or door by which the key-hole is closed is held by a pin passing through a small aperture in the escutcheon, and those used in the common letter or puzzle padlock, but with this important difference, that instead of the rings or plates being formed each of a solid piece, it consists of an inner and outer ring; the inner one, which contains the notches for allowing the bar to pass through, being so mounted within the outer one, which has the letters or numbers on its periphery, that it may be turned with the key, in order to any required position, or pleasure. The result is, that the relative positions of the internal notches, and the external letters which serve as an index of their situation, may be varied almost indefinitely; and thus, whenever the owner suspects that the secret is known to any improper person, he can vary the combination of letters by which the opening is determined. The details of this ingenious contrivance are fully given in the volume above referred to. In the thirty-eighth volume of the 'Transactions' of the Society of Arts, pp. 221-230, is a minute account of a lock invented by Mr. Angier, in which, in addition to other ingenious features, is an application of the principle of permutation or set combination, the means of not only rendering the initiation of the key all but impossible, but also of so throwing the key itself out of order, that there would be 121 chances to one against a stranger being able to unlock it. In Gottlieb's lock, referred to in the last section of this article, the lock is turned by a key with two bits, and requiring eight or nine distinct movements in the act of unlocking, is used with a double lock capable of shooting two distinct bolts. In Mr. Law- son's lock, referred to in the same section of this article, the key, by which it is stated, the key-hole is so perfectly closed during the act of unlocking, that it would be impossible to move the bolt while a piece remains in the aperture. In Gottlieb's lock, the key is so placed that no key can be put in without perforating it, and that it cannot be removed except by application of the secret key; and to prevent the danger of substituting a fresh paper, its inventor proposed to use paper covered with a device, and torn from a cheque-book which would serve as a tally. In 1831 a patent was obtained by Mr. Rutherford, of Jedburgh, for the construction of a stop-lock or bolt of lock in such a manner that it should be impossible to open the lock with its own key until, by the action of clockwork within or connected with the lock, the stop-plate should be brought into a certain position. By this contrivance a person locking up a bank-safe, cash-box, or a package intended to be sent to a distance, may so arrange the lock that it cannot be opened until the expiration of a certain number of hours. Many contrivances have been effected for attaching an alarm to locks, by which the introduction of a false key should ring a bell or fire a pistol. A good alarm-lock, acting upon a bell enclosed within the case or box of the lock itself, invented by Mr. Michaud, is described in the Society's 'Transactions,' vol. ii. part i. pp. 128-130.

The compound locks used for the doors of iron safes, and for similar purposes, though ponderous and complicated in their appearance, yet in reality, can be made with a key that may be used with a screw by which all the parts of the key are kept firmly in their place. The uppermost or division of the key, which is not numbered, is that intended to shoot the bolt, and must always be placed nearest the end of the key; but the others, marked 1, 2, 3, 4, and 5, may be varied in position at pleasure, so as to correspond with similar changes in the position of the tumblers, or so as to unfit the key for opening the lock. It may thus be ordinarily kept in such a state as to be quite useless to any but the owner, who knows the order of numbers necessary to set it right. Somewhat akin to this class of contrivance is the ingenious secret lock invented by Mr. Friend, and described in the forty-third volume of the Society's 'Transactions,' pp. 114-118, in which it is impossible to open the lock even with the proper key, without the application, at the same time, of an apparatus which is called the guide, and which is so portable that it may be put into a pocket-book. As the action of the guide depends on the permutation principle, even it will not enable a person unacquainted with the numerical order in which it is set, and which may be varied as often as necessary, to open the lock.

In some locks increased complexity, though it may be doubted whether any practical advantage in increased security, is obtained by it, and the danger is certainly, of destroying both comfort and convenience. In one of these locks the contrivances for moving draw-lock and other bolts by means of fixed handles we have said nothing, as these are matters readily understood by an inspection of any common door-lock, and are not essentially connected with the principles of

P. C. S., No. 113.

217 LOC

too much matters of detail to be given here; and Holland gives an engraving of a lock invented by one of the ingenious Smiths of the day, 1600, of which the operation is by a knob or handle which raises an ordinary tumbler, which, however, can only be lifted by previously bringing a series of other tumblers into such a position that a notch cut in all their edges shall be brought over a series of cut notches in the bolt tumbler. The most noticeable feature of this contrivance is, that while the motion of the bit of the key, and consequently that of the series of tumblers upon which it acts, is not greater than that of the edges of set tumblers upon which the notch is cut are capable of moving through a large arc, thus affording the opportunity for cutting a great number of serrations, or the tumblers above mentioned, to baffle any attempt at picking by the tentative process.

Of some other curious inventions for additional security we can only give a passing notice. Some locks have been made in which the action depends on the key being a powerful magnet. In others the difficulty of opening is increased by requiring a peculiar method of applying the key; but in addition to the circumstance that the secret must be known to several persons, these contrivances suffer from being very inconvenient in use. As a mere mechanical curiosity we may refer to one, contrived by Mr. Thomas Arkwright, and described in the eighteenth volume of the Society's 'Transactions' of 1785. In this invention, a key with two bits, and requiring eight or nine distinct movements in the act of unlocking, is used with a double lock capable of shooting two distinct bolts. In Mr. Lawson's lock, referred to in the same section of this article, the key, by which it is stated, the key-hole is so perfectly closed during the act of unlocking, that it would be impossible to move the bolt while a piece remains in the aperture. In Gottlieb's lock, the key is so placed that no key can be put in without perforating it, and that it cannot be removed except by application of the secret key; and to prevent the danger of substituting a fresh paper, its inventor proposed to use paper covered with a device, and torn from a cheque-book which would serve as a tally. In 1831 a patent was obtained by Mr. Rutherford, of Jedburgh, for the construction of a stop-lock or bolt of lock in such a manner that it should be impossible to open the lock with its own key until, by the action of clockwork within or connected with the lock, the stop-plate should be brought into a certain position. By this contrivance a person locking up a bank-safe, cash-box, or a package intended to be sent to a distance, may so arrange the lock that it cannot be opened until the expiration of a certain number of hours. Many contrivances have been effected for attaching an alarm to locks, by which the introduction of a false key should ring a bell or fire a pistol. A good alarm-lock, acting upon a bell enclosed within the case or box of the lock itself, invented by Mr. Michaud, is described in the Society's 'Transactions,' vol. ii. part i. pp. 128-130.

The compound locks used for the doors of iron safes, and for similar purposes, though ponderous and complicated in their appearance, yet in reality, can be made with a key that may be used with a screw by which all the parts of the key are kept firmly in their place. The uppermost or division of the key, which is not numbered, is that intended to shoot the bolt, and must always be placed nearest the end of the key; but the others, marked 1, 2, 3, 4, and 5, may be varied in position at pleasure, so as to correspond with similar changes in the position of the tumblers, or so as to unfit the key for opening the lock. It may thus be ordinarily kept in such a state as to be quite useless to any but the owner, who knows the order of numbers necessary to set it right. Somewhat akin to this class of contrivance is the ingenious secret lock invented by Mr. Friend, and described in the forty-third volume of the Society's 'Transactions,' pp. 114-118, in which it is impossible to open the lock even with the proper key, without the application, at the same time, of an apparatus which is called the guide, and which is so portable that it may be put into a pocket-book. As the action of the guide depends on the permutation principle, even it will not enable a person unacquainted with the numerical order in which it is set, and which may be varied as often as necessary, to open the lock.

In some locks increased complexity, though it may be doubted whether any practical advantage in increased security, is obtained by it, and the danger is certainly, of destroying both comfort and convenience. In one of these locks the contrivances for moving draw-lock and other bolts by means of fixed handles we have said nothing, as these are matters readily understood by an inspection of any common door-lock, and are not essentially connected with the principles of

P. C. S., No. 113.

Vol. II. 2 P
security. It is a defect of ordinary draw-back locks that occasionally, from want of oil, from the bevelled end of the bolt becoming rusty, or from some other cause, they will not close without slamming the door violently, and are liable not to act at all, unless they be held open. The latter may be, in addition to the ordinary door-lock, consisting of an internal catch which detains the bolt when it is drawn back, but out is released the instant the door is thoroughly closed, by the pressure of a small projecting catch, or chok, or jamb, by the door-frame itself. All these details are fully given in the Society's 'Transactions,' vol. xix. pp. 290-535.

The second invention referred to is Chubb's combination latch, which combines the simple lifting action of the ordinary French latch, or that which opens with a handle inside the door, and with a key from without, with much of the security of a tumbler lock. In it two, three, four, or more distinct latches are mounted, like a series of tumblers, upon one axis, and made to shut into or behind a double catch, in such a way that they can only be disengaged from it by being all of them raised at once to one exact height, by an arrangement similar to that by which a series of tumblers are raised.

LOCUST (the Gryllus migratorius of Linnaeus, Locusta migratoria of modern entomologists), a well-known insect, belonging to the order Orthoptera and family Locustidae. Locusts are abundant in parts of the western United States, desert lying, and, being gregarious, are thus enabled to perform great devastation, so that when a swarm has destroyed the vegetation of one district, they are enabled to take another, though at a considerable distance. The migratory locust has coexisted in a great variety of animals and people. The pestilential carcase of the dead animal scare the Arians of Nigeria, its leaves are so destructive, whilst the putrid carcases of his dead animal infest the air. The Arabs and people of Nigeria use these insects as food. For full details of the habits, &c. of the Locusts, see Kirby and Spence, Introduction to Entomology.

LOGGE, THOMAS. is supposed to have been born about the year 1556. He was entered at Trinity College, Oxford, in 1573, took a degree, and then, going to London, became an actor and player. About 1580, in an answer to Gosson's 'School of Abuse,' he wrote a 'Defence of Stage-plays,' which was suppressed by authority, and is now one of the rarest of English books, only two copies being known. Another work of Lodge, his 'Afarun against Auarers,' which takes up incidentally the defence of the stage, was printed in 1596. Ten years later he was a student in Lincoln's Inn. Afterwards, it has been conjectured, he became a soldier; and it is known that, in some capacity or other, he accompanied the expeditions of Clerke and Cavendish. According to the information commonly received from the historians of our early literature, this fiery soldier went through yet another change; for he is usually identified with a Doctor Lodge, who obtained the degree in medicine at St. Andrews in 1593 'A Tisclsie on the Plague,' and in 1616 obtained a passport from the Privy Council to 'travel into the Archduke's country,' and recover debts owing to him. Lodge is believed to have died of the plague in 1625.

He was a voluminous and versatile writer. He translated Josephus and Seneca ('The Works of Josephus,' London, 1602, fol.; 'Seneca's Works, both Moral and Natural,' London, 1614, fol.); he wrote several novels, volumes of verses, and miscellaneous pamphlets; and he was a distinguished contributor to the drama in the years immediately preceding the appearance of Shakespeare. His extant dramatic works are two: 1. 'The Wounds of Civil War, lively set forth in the True Tragedies of Marius and Sylla,' 1594, 4to., reprinted in the last edition of Dodson's 'Old Plays,' vol. viii.; a stately historical play, with some eloquence, much action, and little interest either of character or incident. 2. 'A Looking Glass for London and Englands;' made by Thomas Lodge, Gent., and Robert Greene, in Arisbus Majoris,' 1597, 4to., a whimsical but animated dramatic picture, allied to the absurdities of the authorities of Greene.

But Lodge's own exertions as a dramatist, although they entitle his name to a place beside those of Greene and Peele, are not so high as the least of the last; one of these works furnished to a greater than himself. One of his novels is entitled 'Roselynde: Euphues Golden Legacie; found after his death in his cell at Silexdes. Bequeathed to Philip II. Sonnes, noured up with their Father in England. Fetch from the Canaries; 3. 1590, 1592, 1620, 1623, 1642, 4to.; reprinted in Mr. Collier's 'Shakespeare's Library,' 1640. From the above incidents (indeed many also of the minor ones), the grouping of the characters, and many of the strokes of portraiture, for which Greene is so famous, are evident. As Lodge's works exhibit a deeper effort, and his sentiments are more tender, his characters more personable, his scenes more picturesque, both in its prosaic descriptions and narratives, and in the interpolated verses.

LOGGINGS, THE LAW OF, differs according to the custom which regulates each particular case from the general rules of law between landlord and tenant. [TENANT and LANDLORD, P. C.]

As the length of the term for which lodgings are let seldom exceeds or even extends to a year, it is rarely the case that a six months' notice to quit is necessary to be given by the party wishing to determine the tenancy. This can only happen when it is clearly understood that the tenancy is from year to year. But if the taking be for less than a year, as for a quarter, a month, or a week, which may be presumed from the rent being paid at the lapse of those terms, or other circumstances, the length of notice will be regulated accordingly, and the notice of the landlord to quit must be given in the same manner as the notice of the tenancy being that of the term. Unless the lodger gives up possession paying the rent for a whole term in advance, notice of the tenancy will not be released from such a necessity merely from an approbation of the landlord, however just, of his goods being detained for his landlord's rent.

A contract to let lodgings being a contract for land under the interpretation of the Statute of Frauds, unless such contract be in writing an act for sale and occupation cannot be maintained against the party refusing to enter.

Lodgers are entitled without special contract to the use of such things as, though situated in another house of the house, are necessary to their convenience, as the knocker, door-bell, skylight, &c.

It has been held that a covenant by the leasee not to underlet, is not broken by taking in a lodger, and on this ground may be rested the right of the original landlord to enter and distrain the goods and chattels of the lodger for arrears of rent due from the leasee, it being considered that the occupation of the lodger is that of the leasee. The lodger however can resort to his right to recover against the leasee for the loss so incurred.

The 7 & 8 Ge. IV. c. 29, § 45, protects the property of those who belong to the district of the leasee by making it felony for the person in occupation to steal or appropriate any chattel or fixture allowed to be used in any house or lodging.

(Discussion relating to this subject see Woodfall, Landlord and Tenant; and Coote, Landlord and Tenant.)

LOGAN, JOHN, was born at Fain, in the county of Edin-burgh, to a religious, though poor, parentage, son of a small farmer, and, being destined to the clerical profession, was educated at the University of Edinburgh; after which he became tutor to the late Sir John Sinclair. In 1773, almost immediately on being licensed as a preacher in the Established Church of Scotland, he was appointed to be one of the ministers of the town of Leith. In 1770 he had edited the posthumous poems of his friend Michael Bruce, incorporating with them some pieces which he claimed (and probably justly) as his own, and among which was the well-known Ode to the Cuckoo. His poetical talents were further shown by several pieces of sacred poetry, some of which are inserted in the collection of hymns and paraphrases of Scripture annexed to the psalms of the Scottish church. In 1779, patronized by Blair, Robertson, and other literary men, he delivered in Edinburgh a course of Lectures on the Philosophy of History; the reputation of which justified him next year in his attempt to introduce unsuccessfully, to the Professors of Universal History in the University. Outlines of a part of his lectures were published under the title of 'Elements of the Philosophy of History, Part I.,' 1781. In the same year he was appointed to be a professor of Law on the Government, Manners, and Spirit of Asia." and a volume of Poems, which reached a second edition before the year 1786. He was closely connected with the last of the house of Logan, one of the last of a long line of men of such a name, all of whom were musicians, some of whom were successful in the law, and one of whom was a man of much eloquence, and a highly popular preacher. But his poetical endowments, strongly
lyrical in their tendency, were the highest he possessed; and unfortunately he was tempted to apply these in a path where he was ill calculated to shine, and for the adoption of which proved fatal not only to his professional usefulness, but to his happiness. In 1783 he prised and caused to be acted in Edinburgh a tragedy called 'Rumamade,' which had been represented at Covent Garden; and afterwards published in the English Review, and written by the Lord Chamberlain. This publication brought upon him the anger of his Presbyterian associates; and these and other annoyances, aggravated by an hereditary tendency to hypochondria, from him, in 1785, he quitted his parochial charge and repaired to London. There, retaining by agreement a part of his clerical income, he eked out his living by literary labour, writing papers for the English Review, &c. He was one of the principal Charges against Mr. Hastings, which brought on Mr. Stockdale, the publisher, a prosecution for breach of privilege; the other was a useful summary, entitled 'A View of Ancient History, including The Progress of Literature and the Fine Arts, by William Rutherford, D.D., Master of the Academy at Uxbridge,' 2 vols. 8vo. He died in London on the 30th of December, 1788. His friends Drs. Blair, Robertson, and Hardy, published a volume of his Sermons in 1790, and a second in 1791. These sermons long enjoyed very great popularity, and have been several times reread. They are among the most eloquent that the Scottish church has produced. A third edition of his poems, with an account of his life, appeared in 1805; and the poems are included in Dr. Anderson's collection.

LOG. A Review of the principal Charges against Mr. Hastings, which brought on Mr. Stockdale, the publisher, a prosecution for breach of privilege; the other was a useful summary, entitled 'A View of Ancient History, including The Progress of Literature and the Fine Arts, by William Rutherford, D.D., Master of the Academy at Uxbridge,' 2 vols. 8vo. He died in London on the 30th of December, 1788. His friends Drs. Blair, Robertson, and Hardy, published a volume of his Sermons in 1790, and a second in 1791. These sermons long enjoyed very great popularity, and have been several times reread. They are among the most eloquent that the Scottish church has produced. A third edition of his poems, with an account of his life, appeared in 1805; and the poems are included in Dr. Anderson's collection.

LOGARITHMS, HYPERBOLIC. As tables of hyperbolic logarithms are not very frequently met with, the following table is given to facilitate the finding of the hyperbolic logarithm by means of the common one. It is fact a table of the hyperbolic logarithms of the powers of 10: thus opposite 12 we see 11,101,412,5, which is the hyperbolic logarithm of 10^12, or a million, in 17 millions.

To find the hyperbolic logarithm of a number, multiply the common logarithm of that number by 2; 2-03255809, by means of the table. Set down the number opposite to the integer of the logarithm, that then oppose to the first pair of decimal figures, leaving out the two last figures, then that opposite to the second pair, leaving out the four last figures, and so on.

Add the results together. But if the characteristic of the common logarithm be negative, subtract the united results of the pairs of decimal places from the result of the characteristic, and make the answer negative. For example, refer to the logarithm of 2, that is the 20-03255809; the 20 is 1, and the 03255809 is -03255809. Subtract 20 from -03255809, and the result is -2003255809. This is the answer, and it is to be placed in the 6th column, opposite the 15, 15 columns following the 3.

Hence the hyperbolic logarithm of 2 is -6-55709553.

LOGARITHMS, USE OF. We have thought it advisable to add to this work directions on the method of using logarithms, independent of all considerations connected with the meaning and theory of those numbers. Thus a person who has a table of logarithms, and finds its logarithmic ex-
any system of tables in part... There are many reasons against our inserting the table of logarithms in a large work of reference, as was frequently done a century ago: we are pretty certain that it would not be used.

1. The object of logarithms is the performance of the second and third operations in the following ascending scales by means of the more easy one which precedes it:—

Addition, Multiplication, Raising of Powers.

Subtraction, Division, Extraction of Roots.

Thus multiplication is reduced to addition, raising of powers to multiplication, division to subtraction, extraction of roots to division.

2. The sum of the logarithms of two numbers gives the logarithm of their product, the difference of two logarithms gives the logarithm of the quotient, and so on. These rules are best expressed in symbols, thus:

\[ \log A + \log B = \log (A \times B) \]
\[ \log A - \log B = \log \left( \frac{A}{B} \right) \]
\[ \log (A^m) = m \log A \]
\[ \log \left( \frac{A}{m} \right) = \log A - m \]

3. The logarithms wanted are taken partly from a table, partly from an easily remembered rule. The integer part of the logarithm is found by the rule; the fractional part by the table.

4. The integer portion of the logarithm is called the characteristic of the number: thus 2167.3 has 3 - 33592 for its logarithm, and 3 is the characteristic of 2167.3. It is very common to call this 3 the characteristic of the logarithm itself; but it is better to fix this appellation upon it in connection with the number from which it arises.

5. The characteristic of a number depends entirely upon the place which the decimal point occupies. But the rest, or fractional part, of the logarithm of that number depends upon the significant figures only of the number, and has no connection with the meaning which those figures gain by their position relatively to the decimal point. Thus 21673, 21.673, .00021673, 0.00021673, 216730000, &c. are numbers with different characteristics, or different integer portions in their logarithms. But the fractional portions are the same in the logarithms of all, namely, -33592.

6. The characteristic of a number may be either positive or negative. For our present purpose, it will be sufficient to lay down the rules for using these quantities, directing the reader who is not used to the distinction to try to explain them by considering positive quantities as gains, negative quantities as losses, addition as junction, subtraction as removal. Thus the addition of a positive quantity (annexation of a gain) is the same as the subtraction of a negative quantity (removal of a loss); and so on. The following examples will illustrate this; the negative quantity being distinguished from the positive one by a bar drawn above it:—

3 and \( \overline{3} \) make 3. \[ \overline{2} \text{ from } 3 \text{ gives } \overline{1} \]
3 and \( \overline{1} \) make \( \overline{3} \). \[ \text{ from } 3 \text{ gives } . \overline{5} \]
2 and \( \overline{7} \) make 9. \[ \text{ from } 2 \text{ gives } \overline{5} \]
4 times \( \overline{6} \) is 24; \[ \text{ from } 2 \text{ gives } 1 \]
carry 3, which gives \( \overline{2} \). \[ \text{ from } 3 \text{ gives } \overline{5} \]

7. The rule for finding the characteristic is as follows. When there are significant figures before the decimal point, the characteristic is one less than the number of them. But when the significant figures begin after the decimal point, the characteristic must be marked negative, and must point out the place in which significance begins. Thus the characteristic of 2791.08 is 3; that of 17462 is 4; that of 0.237 is 1; that of 9.999 is 0; that of .763 is 1; that of 0.198 is \( \overline{2} \); that of 0.00072 is 5.

8. It is worth while to remark that this broken rule, as it seems to be, requires subdivision in the following ascending scales by means of the more easy one which precedes it:—

Addition, Multiplication, Raising of Powers.

Subtraction, Division, Extraction of Roots.

division to subtraction, extraction of roots to division.

In multiplication, the multiplication of the negative figure produces a negative result, and the carriage from the positive part goes in diminution of this number. The last step is:—

6 times \( \overline{3} \) is \( \overline{1} \), \( \overline{8} \) is \( \overline{3} \).
In division, a divisible figure must be sought above the negative characteristic, not below it; and the characteristic must be diminished by 1 in order to make the result correct. The characteristic must be afterwards carried to the right in the usual way.

When \( \overline{21} \) is divided by 6, the first step is:—5 is contained in 25, \( \overline{5} \) times, carry \( \overline{4} \); then 5 is contained in 41, 8 times, &c.

In multiplication, the multiplication of the negative figure produces a negative result, and the carriage from the positive part goes in diminution of this number. The last step is:—

6 times \( \overline{3} \) is \( \overline{1} \), \( \overline{8} \) is \( \overline{3} \).

9. A mixed number, such as \( 3 \cdot \overline{92741} \), is thus multiplied and divided:

\( 3 \cdot \overline{92741} \)
\( 6 \)
\( \overline{63} \cdot \overline{8247} \)

10. The decimal part of the logarithm is taken out of the tables. These are not complete logarithms, which could not be given, since the real logarithms are generally interchangeable decimals. The only numbers which have logarithms capable of finite expression (in the system commonly used) are those in the series: .0001, .001, .001, .01, 1, 10, 100, 1000, ... of which the complete logarithms are the characteristics themselves, or, \( \overline{4}, \overline{3}, \overline{2}, \overline{1}, 0, 1, 2, 3 \). The tables give only a certain number of the first decimal places, and may be named after the number of decimals in the logarithms they give. Thus a table which gives four decimals in each logarithm may be called a four-figure table; and so on. A calculator chooses his table according to the degree of accuracy he wants: the general rule being that, so many decimals as there are in the logarithms, so many significant figures of the answer must be correct, with perhaps an error of one or two in the last figure. Thus if the real answer to a question were \( \overline{00132759738} \), we might expect from four-figure tables to get \( \overline{00132759738} \), or \( \overline{001327598} \), or \( \overline{001327599} \). But seven-figure tables would probably give from \( \overline{00132759569} \) to \( \overline{00132759769} \). Perhaps the liability of the last figure to error is, for the general run of questions, rather over than under stated in the above. Four figures is very often enough; five figures almost always. When five figures are not sufficient, we should recommend having recourse to seven at once, for a reason presently mentioned.

We insert specimens of a four-figure, five-figure, and a seven-figure table.
12. To find the logarithms of numbers and the numbers to logarithms, from the four-figure table, proceed as follows:—

From inspection of the number, take the proper characteristic, and then note the first four significant figures. In the row which begins with the first two, find the figures which are in the column headed by the third; and add to them the figures out of the side table which are in the column headed by the fourth.

For instance, required, as well as it can be given from a four-figure table, the logarithm of $4275898.116$. The characteristic is $6$; and the first four significant figures are $4276$ (reading $58$ rather as $60$ than as $50$). In the row $42$, and under $7$, we see $6304$, and in the side table opposite to $6$ is $6$, and $5340 + 6 = 6306$. Hence $6306$ is the logarithm of the number $4275898.116$, as far as the four-figure table will give it. Similarly the logarithm of $4$ (which must be read $400$) is $1.6021$, that of $430$ is $2.6385$, that of $40179$ is $2.6210$.

To find the number to a logarithm, in the four-figure table, use the decimals of the logarithm with the antilogarithmic table in the same manner as the four significant figures were used in the other table to find the logarithm; and then settle the place of the decimal point by means of the integer of the logarithm. The four-figure table goes into so small a space that it is worth while to print an inverse table of antilogarithms, or of numbers to logarithms; of which table we have also given a specimen above.

Thus the number to the logarithm $5.6294$ being required, we neglect $5$, and, going into the antilog with $6294$, opposite to $62$ and under $3$, we find $4198$, and under $4$ in the side table we find $4$. Hence $4198 + 4 = 4202$ are the first four significant figures of the number required; and its characteristic is $5$; whence $4202000$ is the number to the logarithm, as near as the four-figure table will give it. Similarly the number to $6111$ is $4.084$, that to $3.6208$ is $0.04177$, that to $9.6000$ is $398100000$.

13. We give an instance of the application of each of the rules in §2. Let it be required to find closely as four-figure tables will do, the product of $17798$ and $69496$; the quotient of $17.393$ divided by $942942$; the eighth power of $1.2973$, and the eleventh root of $0.000556918$. The processes are as follows:

| Log. of $17798$ (say $17800$) | $4.25044$ | Add |
| Log. of $69496$ (say $69340$) | $4.8023$ | Log. of product $9.0527$ |
| Answer $1129000000$ from the table. |

True Answer $1128655684$ |

Error $144065$, about $0.0101$ of the whole.

Again, log. $17.293$ (say $17.29$) $1.2377$ | Subtract |

log. $942942$ (say $9429$) $1.9745$ | |

log. of quotient $1.2629$ |

Answer $18.33$. |

log. of $1.2973$ (say $1.297$) $0.2549$ |

multiply by $8$ |

log. of $(1.927^2)$ $2.2792$ |

Answer $190.2$. |

In raised powers, the errors are generally larger than in other processes, seeing that the necessary error of the logarithm is multiplied as many times as the logarithm itself.

log $0.0005569181$ (say $0.0005569$) $\frac{5}{7} - 4.585$

Divide by $11$ $1.6133$ log $\sqrt{0.0005569}$ Answer $-1.405$.

14. Before beginning to use five-figure tables, it is advisable to practise the formation of the tens of numbers not exceeding 50, in the head. For instance, which is the nearest integer to 7-tenths of 37. The process at length will of course be $3.7$.

15. In the specimen of the five-figure table will be seen four figures of number, followed by five figures of logarithms, and an additional column marked D, which contains nothing but the differences between the successive sets of five figures in the logarithm. This column D is referred to under the name of the column of tabular differences. To take the logarithm of a number, take the characteristic as before, and five significant figures of the number. Find out the first four significant figures in the table, and their five figures of logarithms add as many tenths of the tabular difference as there are units in the fifth significant. Thus to find the logarithm of $011217$, we find $11217$ in the specimen, opposite to which is $04061$, with $38$ for a tabular difference. Now 7-tenths of 38 is 26.61 and 27 is 88; so 04088 is the decimal part of the logarithm. Similarly if the significant of the number be 11223, the decimals of the logarithm are 05011; also 11901 gives $04926$; 11209 gives $04957$; 58332 gives $76591$; 58335 also gives $76591$; 58334 gives $76592$; and so on.

16. There is no antilogarithmic table to a five-figure table; and the way of finding the number to a logarithm is as follows: Seek out among the logarithms the decimals next under the decimals of the given logarithm, and take the four figures of number belonging to them for the first four significant figures of the number. Find by how much the decimals just used fall short of the given decimals, and call this difference the unattained part. Annex a cipher to the unattained part, and divide by the tabular difference; the digit which most nearly expresses the quotient is the fifth significant of the number. For instance, what is the number to the logarithm $3.05016$. Looking into the table, we find that the number next under $05016$ is 04996, opposite to 1122. The unattained part is 17; the tabular difference 39 and 570 contains 39 times more nearly than 5 times; so that 4 is the fifth figure. The five significant of the number required are then 11224; and, looking at the integer part of the logarithm, the characteristic is seen to be 3; whence $0011224$ is the number to the logarithm, as correctly as five-figure tables will give it.
17. The four questions worked above with four-figure logarithms are thus worked with five-figure logarithms:—

17798 4·25037 17·293 1·29377
65426 6·00227 9·4924 1·97449
1128900000 9·05264 18·589 1·96388
50231 26316
1·9273 0·28495 8·000055692 11·574580
2·0404 61825
190·37 2·27960 27944
10·40
28·160

18. The seven-figure tables have five figures of number, with seven decimals of logarithm; and the sixth and seventh significant of the number are to be provided for by means of the tabular differences. But as these tabular differences run to three and four places of figures, their tenths are written down in small separate tables. [Proportional Parts, P. C.]

To take out a logarithm, take out the seven decimals belonging to the first five significant of the number, and add from the table of proportional parts the number opposite to the sixth significant, and one-tenth of that opposite to the seventh significant. Thus, if we find the logarithm of 46517879, of which the first seven significant are 45617879, look in the table for 45517, and we have

<table>
<thead>
<tr>
<th>Tab. Pro. P.</th>
<th>gives</th>
<th>Do. do</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>6581776</td>
<td>7</td>
</tr>
<tr>
<td>29</td>
<td></td>
<td>7</td>
</tr>
</tbody>
</table>

So the logarithmic required, as far as seven-figure tables will give it, is 3·6581772.

A little practice will enable the calculator to add together, without writing them down, the two contingents derived from the table of proportional parts. The computer must be careful not to miss the change of the third figure of a logarithm, which usually takes place in the middle of a line, though it can only be marked at the beginning. Thus, in the specimen the logarithm of 45003 has the decimals 6580934, but that of 45004 has 6590026, not 6580926. Some mark is usually made to give warning that the change has taken place; but those whose attention is so little alive to the circumstance as to stand much in need of this mark will often make the mistake in spite of it.

To take the number to a given logarithm out of seven-figure tables proceed as follows: Find the nearest decimals under the given decimals, and by subtraction find the unattained part. Take out the five numbers belonging to the attained part, and the first five significant of the number. Look in the table of proportional parts for the nearest under the unattained part, and take the digit opposite to it for the sixth significant. Annex a cipher to the remainder of the unattained part, and take the digit opposite to the result (or its nearest) in the table of proportional parts for the seventh significant. For instance, required the number to the logarithm 1·6590176:

<table>
<thead>
<tr>
<th>45605</th>
<th>gives 6590176</th>
</tr>
</thead>
<tbody>
<tr>
<td>6590125</td>
<td>51</td>
</tr>
<tr>
<td>48</td>
<td></td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
</tbody>
</table>

Number required 45·60533

20. The following is the working of the four questions already worked with four-figure and five-figure tables:

17798 4·25037 17·293 1·29377
65426 6·00227 9·4924 1·97449
1128900000 9·05264 18·589 1·96388
50231 26316
1·9273 0·28495 8·000055692 11·574580
2·0404 61825
190·37 2·27960 27944
10·40

17·293 1·29377
9·4924 1·97449
18·589 1·96388
2·27960 61825
27944

18·38941 1·253853

21. More complicated questions may be directly solved by logarithms, that is, without requiring to seek the number to a logarithm until the end of the process, as long as the multiplications, divisions, inversions, and evolutions are not broken by additions or subtractions. Thus to calculate \( (ab + c) / (d + e) \) we form the logarithm of the answer

\[
\frac{1}{10} \left( 2 \log a + \log b + \log c - \log d - \log e \right)
\]

But if additions or subtractions intervene, the process must be broken to produce the result; that is, the logarithmic process must be suspended, and the results exhibited in numbers for the performance of the additions and subtractions (unless indeed the logarithms described in the next article be employed). Thus to find \( \sqrt[4]{(a^2 + b + c)} \), it would be necessary, not merely to form the logarithms of \( a^2 \) and \( c \), or \( 2 \log a + \log b + \log c - \log d \), but to find the numbers to them: these numbers being then added, and the logarithm of the sum being taken, half the last logarithm is the logarithm of the answer.

22. There is nothing in the trigonometrical logarithms more than is described in Trigonometrical Tables, P. C. Many young students, from seldom or never using the actual sines, cosines, &c., of angles, but only their logarithms, are apt to confound the former with the latter.

23. Some little additional correctness may be obtained by annexing to the use of the tables, as given above, an attempt to add a mere check to the one more figure of the number. Thus suppose it required to find the logarithm of 11·374928. In the four-figure table 113 has 0531 and ... 7 adds 26. The next figure is 4, which, had it been the fourth significant, would require the addition of the whole of 15; being the fifth figure, let it add the tenth of 15, or its nearest integer, 2. Hence we add 28 instead of 26 to 0531, and get 0559 instead of 0557, as a nearer approach to the logarithm. Again, in the five-figure table, 1137 gives 05670, and the tabular difference is 38. The 4 gives 15, or 4-tenths of 38, and the 9 ought to give 9-hundredths of 38, or 3. Consequently 15 + 3, or 18, is added, giving 05694. Had 49 been read as 60, in the usual way, 19 would have been added. In the seven-figure tables 11374 gives 0559132; 9 adds 345, the 2 should add the tenth of 77, and the 8 should add the hundredth of 306; hence 3 more should be added as from the figures 92.

This plan may be followed when the greater part of the desirability, especially in the four-figure table. It is most useful when the tabular differences are large, that is, at the beginning of the table.

24. It may sometimes save a mistake if the computer remember that the significant of the number generally read less than those of the decimals in the logarithm. Thus 200... has 301,... for the decimal figures of the logarithm. It is 1, so however at the beginning of the table, and the figures of the logarithm overtake those of the number between 13712 and 13713.

25. The rule of the characteristics, when well learnt, furnishes one of the easiest modes of assigning the place of a decimal point in a common division. For example, in dividing 0·017643 by 0·18416, the characteristics being 3 and 2, we shall have to carry 1 to 2, because the significant of the divisor, 18, is greater than those of the dividend, 17. Take 1 then from 3, which leaves 2, the characteristic of the quotient, which has therefore 0 before its significants. The rule is, to find the characteristic of the quotient, from that of the dividend subtract that of the divisor, carrying 1 if the significant of the divisor be greater than those of the dividend.

26. In using the trigonometrical tables, or any other, careful attention must be paid to the right choice of the method of interpolation. If the argument and tabular result [Tables P. C.], or the numbers with which we enter the table and those which we take from it, increase together or diminish together, then the alterations introduced by the table of proportional parts consist in adding to every addition to the other, and subtracting for every subtraction. But if
the tabular result diminish as the argument increases, then every addition to the one is accompanied by a subtraction from the other, and vice versa. In the tables of logarithmic cosines and cotangents, the young computer frequently finds itself far from the goal of the last indicated direction. Thus the logarithm of the cosine of 84° 9' in a five-figure table is 9·00828, and the tabular difference is 124, diminishing. Hence the log cosine of 84° 9'5 is not 9·00828 +·00006, but 9·00828 -·00005. And if we ask for the angle whose log-cosine is 9·00840, we find the next underneath this in the table to be 9·00829, and 22 for the unattained part. Divide 220 by 124, and 2 is the nearest integer. But the angle required is not 84° 9' +·02, but 84° 9' -·02, or 84° 8'.

27. The equation $a' = b$, in which $x$ is unknown, is solved by taking the logarithm of both sides, which gives $x \log a = \log b$. This is sometimes called log-logarithm. The angle required is also obtained by adding the logarithm of $a'$ to the logarithm of $a$. The result is the same as by Briggs's method of interpolation between logarithms.

The reader is supposed to know the complete interpretation of algebrical exponents. We have then

$$x = \log (\cdot00163) \div \log (\cdot47) = 3·21919 + 1·76596$$

$$y = \log (\cdot182) \div \log (\cdot47) = 1·77815 + 2·26007$$

Now throw the three logarithms which have negative integers into the more usual algebraical forms.

$$211219 - 3 = 75696 - 1 = 77815 - 1$$

or $-24804 + 282186$

And make the divisions, which give for the quotients 11·471, and $-0988161$; or

$$\left(\frac{4}{7}\right)^{11·471} = \cdot00163, \quad (182) -0988161 = \cdot6$$

LOGGAN, DAVID, a line-engraver and designer, of considerable eminence in England in the time of Charles II., was born at Danzig in 1653. He appears to have first learnt his art from Lyonson, in The Hague, and, after working subsequently with Hondius in Holland. He came to England during the Commonwealth, and spent some time in engraving heads in London. But his first work of consequence in this country was a set of plates of the colleges of Oxford—' Oxonia Illustrata,' for the sale of which he had fifteen years' privilege; he executed afterwards a similar series of the colleges of Cambridge. He also engraved on eleven folio plates ' Habitum Academiconior Oxfire.' A Doctor de Servientem.' Loggan is himself entered on the books of the University; in the matriculation registry there is the following entry—'

David Loggan, Gedenusia, Universitae Oxon. Chalchopographya, 1672.'

He married Mrs. Jordan, of a good family, near Witney, Oxfordshire, by whom he had a son, who became a fellow of Magdalen College, Oxford. He died at his house in Leicester-fields in 1685.

Loggan engraved many portraits of illustrious persons in the time of Charles II., many of the drawings of which were executed in lead by himself from the life—as King, prince of Denmark; the Duke of Albemarle; the Earl of Clarendon; the Earl of Argyle; the Duke of Ormond; the Lord Keeper Guildford; Archbishop Sancroft; the Bishops Mew, Seth Ward, and Pearson; and many others. There are prints also by Loggan of Archbishops Usher and Boyle, and of Bishops Sprat of Rochester, Lake of Chichester, Crew of Durham, Compton of London, Gunning of Ely, Reynolds of Norwich, and Lloyd of St. Asaph. He engraved also three portraits of Charles II., in one of which the king is leaning on his hand on Archibishop Sheldon; James, duke of York; the Duke of Monmouth; the Queens Catherine and Henrietta Maria; Pope Innocent XI.; the Earl of Derby, Sir Edward Coke, Sir John Chardin, Thomas Barlow, Titus Oates, and many others, which are enumerated by Vertue.

Loggan had the following assistants—A. Blooteling, G. V. Winter, and R. Williamson; the first two came from Holland with Loggan. (Vertue, Catalogue of Engravers, &c.)

LOIR, NICOLAS, a distinguished French painter and etcher, was born at Paris in 1624. His father was an eminent jeweller, and he placed Nicolas with Sebastien Bourdon, and sent him afterwards, in 1647, to complete his studies in Rome. Here Loir studied chiefly the works of N. Poussin, and so carefully that in some instances it is said to be scarcely possible to distinguish Loir's copies from originals. He had great facility of execution, and excelled in various styles, as history, landscape, and architecture. He also composed with elegance, and his colouring is very agreeable; but his design is somewhat affected, and is not always vigorous or correct in its outline.

He painted at Rome an excellent picture of Darius opening the Tomb of Sesostris, which obtained for him a great reputation. He returned to Paris in 1649, and was shortly afterwards employed by Louis XIV., at the Tuileries and at Versailles. He painted two apartments in the Tuileries—the Antichambre du Roy and the Salle de Gardes, where, by the mythical representation of the sun and other figures, he illustrated the distinctive character of the life and reign of Louis XIV.; and so far to the monarch's satisfaction, that he obtained by these works a life-pension of 4000 francs.

In 1663 he was elected a member of the French Academy of Painting, and he presented on the occasion, as his reception-piece, a picture representing the Progress of Painting and Sculpture during the reign of Louis XIV.; but his master-piece is considered Cleobis and Biton drawing their Mother in a chariot to the temple of Juno, from the story of Herodotus (v. 31); Loir himself has made an etching of it. Another of his best works is Paul before the Rabbi before the Magician of sight, in the Cathedral of Notre Dame at Paris. He excelled in painting women and children, and particularly the Virgin Mary. He is said to have designed twelve Holy Families in a single day, which did not seem to him two figures alike. He died at Paris, rector of the Academy, in 1679. Loir's own etchings amount to 159 pieces, which, together with 90 engravings after his works by other artists, makes a total of 239 prints. Several of the latter were engraved by his brother Alexis Loir.

Felibien describes several of the works of Loir at considerable length; his account of this painter contains also some curious digressions relating to the superstitions of the modern Romans, and other matter. Felibien and Loir were at Rome together, and Felibien's dates have been for this reason adopted in this article, where they differ from those of D'Argenville and Gault de Saint-Germain.

(Felibien, Entretiens sur les Vies et sur les Oeuvres des Peintres, &c.; D'Argenville, Abrégé de la Vie des plus fameux Peintres, &c.)

LOMBARDUS, LAMBERT, the designation of a painter whose actual name is not known. He is sometimes called Lamprecht Susterman or Sutermair, and, according to some, Lambert Savius; and Lamprecht Susterman appears to have been the name applied to him, but his birth is equally unknown: it is said to lie to Liége or Amsterdam, more probably Liége, as he settled there after his return from Italy in 1658, and he died there in 1660, aged forty-four. Vassal also gives the name of Lamprecht. He is distinguished all the Flemish painters, and styles him a great letterato, a judicious painter, and an excellent architect; but his account of his pictures is confused by confounding Lamprecht Savius, who wrote Lambert's Life in Latin: it was published at Bruges in 1665, five years after his death. Lombardus studied under Jan de Marbins before he visited Italy. Frans Floris, Hubert Goltius, and Willem Key were his teachers. His works consist chiefly of drawings with the pen in chiaroscuro; his coloured paintings are scarce; there are two small dimensions in the Gallery of Berlin; there is a Fetta in the University of Pisa which used to be attributed to Daniele da Volterra. Lambert's style is strictly Italian: he is said to have studied under Titian at Venice, and he lived some time in Rome. The surname of Lombardus was probably given to him by his Flemish countrymen on account of his style, which, different from their own, they distinguished as the Lombard style, Lombardi being formerly the general name for the northern part of Italy.

There are many prints supposed to be after Lambert's designs, some of which are marked Lam., and others Savius; and it is not yet decided whether these names indicate one or two artists. Held regards them as two, and Van Mander calls Savius an engraver, and making any allusion to Lombardus. In a note to De Yongh's edition of Van Mander, Savius is styled the pupil of Lombard, and Van Mander, Het Leven der Schilders, &c.; Sandart, Teutsche Academie, &c.; Heineken, Vasi,
LONDONDERRY, ROBERT STEWART, MARQUESSE OF, was born at the family seat of Mount Stewart, in the county of Down, in Ireland, on the 1st of November, 1628 (the same year which gave birth to the Duke of Wellington and to Napoleon Bonaparte). His father, of the same name, after representing the county of Down for many years in the Irish parliament, was made Baron Stewart of Londonderry in 1679, Viscount Castlereagh in 1725, Earl of Londonderry in 1756, and Marquess of Londonderry in 1716—all in the peerage of Ireland. Robert was his only child, and survived him by his first wife, Sarah Scott, daughter of Francis Seymour, First Marquess of Hertford, whom he married in 1676, and who died in 1707.

The estate of Mount Stewart was purchased by Mr. Alexander Stewart, father of the first marquess, who sat in the Irish parliament for the city of Londonderry. Before this the family were known as Stuarts ofBallylawn in the county of Downe, of which property John Stewart, the great-grandfather of Alexander, the first of them who settled in Ireland, obtained a grant from King Charles I. There seems to be ground for believing that he was nearly related to some ennobled branch of the Stuarts: but the connection appears not to be distinctly traceable, and is variously given in the several accounts. The descent of the family is commonly deduced, or rather assumed to be, from Sir Thomas Stuarts of Dalwinton. In the latter part of the fifteenth century, the ancestor of Lord Blantyre, and a younger brother of Sir Alexander Stewart of Dalwinton and Garlies, the ancestor of the Earl of Galloway. John Stewart is stated to have emigrated from Scotland to Ireland in the reign of James I.

The subject of the present notice received the first part of his education at the free grammar-school of Armagh; whence he was removed in 1766 to St. John's College, Cambridge. He was not yet 21 years of age when he entered at the age of 20 he performed himself for the vacant seat in the representation of the county of Down, and was returned, though not without a severe contest, which lasted for two years, and is said to have cost the family 25,000l. or 30,000l. Nor did he come in without so little or in excess of his allowance, in contradiction to what had hitherto been the family politics, to the cause of parliamentary reform, which had for some time been a popular watchword in Ireland. For three or four years, accordingly, he was considered as belonging to the party of the opposition, though to the aristocratic and more moderate section of it. He very early began to take part in the debates.

His conversion from liberalism seems to have taken place about 1738 or 1742; and it may be fairly considered to have been as the result of his acquaintance with the more alarming aspect which political parties in Ireland were every day assuming. Up to this time he appears to have been universally regarded as an unusually amiable as well as a very young man; after the years of the ministry, he was commonly represented as a prodigy both of perspicacity and of heartlessness.

In the summer of 1784 he returned to the British parliament for the county of Down; and after remaining absent for a session he made his maiden speech in the House of Commons in second rowing the 29th of October, 1755. It is said to have greatly disappointed the expectations excited by the reputation he had brought over with him. He was to the last a remarkably unequal speaker; at one time rising above, at another time—sometimes on the same night—falling below his ordinary or average style of execution, a degree scarcely credible, and the more wonderful in a person of such nerve and self-possession. He does not appear to have ever spoken again during this parliament, which was dissolved after the close of that sixth session, in May, 1756. That year he became Viscount Castlereagh; and he was again returned to the next British parliament, which met in September, for the borough of Oxford. But he vacated his seat in July, 1767; upon which he was re-elected to the Irish parliament for the county of Down, and was made Keeper of the Privy Seal for Ireland. In the beginning of 1798 he was appointed Secretary to the Lord Lieutenant in Ireland, on the recommendation of Lord Castlereagh, and from that time to his death he may be regarded as having been distinctly the ministerial leader in the Commons. The credit or discredit of the measures adopted for the suppression of the Rebellion, which broke out and was put down in this year has also been commonly assigned to him, although it does not appear that he really did more than carry out the system which he found already in action when he came into office. He was no doubt one of the principal managers of the project of the Union, which followed two years after.

He was a member of the last house of Lords appointed by the Imperial Parliament, which met in February, 1801; and also to the second, which met in November, 1802; though upon the latter occasion not till after a severe struggle with the interest of the Downshire family, whose hostility had been prevented by the dismissal of the late marquess from the command of his militia regiment and the lord-lieutenancy of the county for his opposition to it.

In the beginning of 1802 he had been made a privy counsellor of Great Britain, and President of the Board of Control; and he retained that office after Mr. Pitt retired and throughout the additional administration. After Mr. Pitt returned to power, Viscount Castlereagh was, in July, 1805, promoted to be one of his majesty's principal secretaries of state (taking the department of War and the Colonies). He was now, however, thrown out of the representation of Down; and was obliged to take refuge in the borough of Boroughbridge, for which he was returned in January, 1806, on a vacancy made by the death of the Hon. John Scott, son of Lord Eldon. He resigned with the rest of the cabinet on the death of Mr. Pitt shortly after this; and to the next parliament, which met in December, a new ministry, he was returned for the borough of Plympton Earl.

Upon the dissolution of the last, and previous to the election in April, 1807, Lord Castlereagh was reappointed to his former office of Secretary of State; and he was again returned for Plympton to the parliament which met in May of this year. He was now more considered, more trusted, and more beloved than ever, though he had been a principal instrument in the conduct of the war; and the failure of the disastrous expedition to Walcheren in the summer of 1809 not only drew upon him much general unpopularity, but involved him in a personal quarrel with his colleague, the Secretary for Foreign Affairs, which led first to the resignation of both, and then to a duel between them, in which Canning, on the second fire, was severely wounded. In the earlier part of this same year, also, some solicitation had been made by two select committees of the Commons which charged Lord Castlereagh, along with other persons, the one with corrupt practices in obtaining the returns of members for Irish boroughs, the other with irregularities in the disposal of Indian patronage.

Lord Castlereagh remained out of office till February, 1812; when, on the resignation of the Marquess Wellesley, he was appointed Secretary of State for the Foreign Department.

After the death of Mr. Perceval, which followed in May, he was regarded as ministerial leader in the Commons. To the new parliament which met in November, 1812, he was again returned for the county of Down; and he also retained that seat in the next two parliaments, which met in August, 1818, and in April, 1820. The return to office of Mr. Canning, however, in 1816, had relieved him of the duties of the department of home affairs; but left him in public business in the House, till that gentleman again retired in 1820.

Meanwhile in the end of the year 1818 Lord Castlereagh had engaged in pleasant Ministerial negotiations opened with the French government at Châtillon, which however broke off a few weeks without any result; and he had also appeared as representative of the King of England at the Peace of Paris, in May, 1814; at the Congress of Vienna, in October of the same year; at that of Paris after the battle of Waterloo in the following year; and at that of Aix-la-Chapelle in 1818. On such occasions he was, for his presence and manner showed to great advantage. He likewise attended George IV. to Ireland in 1820, where he had for the moment the gratification of being extremely popular among his countrymen. He had been made a Knight of the Garter in 1818, and he became Marquess of Londonderry by the death of his father on the 8th of April, 1821.

Lord Londonderry died by his own hand at his seat of North-Grey-Place, in the county of Down, on the 27th of August, 1822. Something unusual in his manner had been occasionally observed for some months, and for a few days before the melancholy catastrophe his extreme irritability and passion of temper, and other symptoms of distress: and from these circumstances of notice of his domestics and friends. On the 9th, the Duke of Wellington wrote to Dr. Bankhead:—"I sincerely hope that you will contrive, by some pretence, to go down to his lordship's house. It does not look in any way well; he appears to me to have been exceedingly harassed, much fatigued" and over-
worked during the late session of parliament; and I have no doubt he labours under mental delirium; at least this is my impression. The coroner's jury which sat upon the body brought in a verdict of lunacy. He had married in 1794 Lady Emily-Anne Hobart, youngest daughter of John, second Earl of Buckinghamshire, and the title went to his half-brother, the present Marquess.

There was no brilliancy of intellect in Lord Londonderry, so far as literature and the study of the classics were concerned, but he possessed a variety of other qualifications and enjoyed the reputation of a great man. He had studied the works of ancient Roman writers and lived among them in the year 529 when he died. He practised as a physician at Frankfort-on-the-Main, and wrote a Herbal, which was merely a compilation of what had been done by others. There is also a John Lonicer mentioned who wrote a commentary on Dioscorides.

This genus is the type of the natural order Caprifoliaceae, and has the tube of the calyx 5-toothed, the corolla tubular, campanulate or funnel-shaped, with a 5-leafed usually irregular limb; 5 stamens; a filiform style, a calyptra stigma; 3-seeded berries, and crustaceous seeds. The species are erect or climbing shrubs, with opposite exstipulate leaves and axillary flowers. There are about 60 species of Lonicerus, many of which have handsome flowers and emit a delicious perfume.

L. caprifolium, Goatseale, or pale perfoliate Honeyuckle, has ringlet whorled terminal and sessile flowers, deciduous obtuse leaves glabrous on both sides, the stem and calyx-base perfoliate, the style glabrous. It has a twining stem, with white or purplish flowers and orange-coloured berries. It is native of the middle and south of Europe, and is found on woods and thickets in many parts of England and the south of Scotland.

L. Periclymenum, the Woodbine, or Honeyuckle, has climbing branches, the leaves all separate, deciduous, sometimes downy, glabrous beneath, ovate, obtuse, entire, the stem tinged at the base, upper ones the smallest; the heads of flowers all terminal ovate, imbricated; the flowers ringlet. The flowers are pale yellow, the berries red, and accompanied with permanent bracts. This plant in early times was supposed to possess powerful medical properties, but it is not now used. It is however extensively cultivated in the gardens and shrubberies of Europe on account of the delicious perfume of its flowers. This plant is the true 'woodbine' of the poets, and Milton has applied to it the name 'twisted eglantine.' This plant has obtained the name of woodbine, a corruption of wood-blind, from its habit of twisting round the stems of trees.

Thus Shakspeare says—

So doth the woodbine, the sweet honeyuckle, Genly entwine the maple.

The name honeyuckle is derived from the habit of children, who draw the corolla out of the calyx, and suck the collected honey from its nectary. Several varieties of this plant are recognised by botanists. All these are beautiful climbers and extend from very fragrant; a little west of Montpelier, the Sposolizio, or the Marriage of the Virgin, and a Holy Family, after the same; the Entombment, after D. Crespi; the Magdalen, after Correggio; the Madonna del Lago, after Da Vinci; Galatea, after Albani; and many heads, after Rembrandt. The Sposolizio was engraved as a companion-piece, or pendant, to Morgan's large print of the Transfiguration, by Raphael. He commenced in 1527 to engrave the Last Judgement, by Michelangelo, from a drawing by the Roman painter Minardi, but he died without finishing it; it was however considerably advanced, and, if not actually finished, could be completed by some of his distinguished scholars. The Madonna del Velo, after Raphael, Longhi also left unfinished, but it was completed in 1834 by his pupil the Cav. Tochli. Longhi died of apoplexy in 1831. He was a Knight of the Iron Crown, and member of many academies.

Besides a few poems and other essays, there is a treatise on engraving, by Longhi (La Calcofigria), which has been translated into German by C. Barth; and contains a Life of the author, by F. Longhena. A Life of him, also, with a list of his works, was published at Milan in 1831; and there are notices of him in the Kunstblatt, and in Nager's Neues Allgemeines Künstlerlexikon.

LONGICORNES, the fourth family of tetrmerous Coleoptera in Latreille's arrangement of insects. It includes a vast number of large and beautiful beetles, all remarkable for the length of their body, which in many species are several times longer than their bodies. They inhabit woods, where they deposit their eggs beneath the bark of trees, effecting the operation by means of a long, strong, horny ovipositor with which they are provided. The females are usually larger than the males. The larva lives beneath the bark of trees or the wood, in which it bores, and do much damage. The greatest assemblage of species and the largest forms are found in South America; but longicorn beetles are very general in the temperate zones. This family is divided into three great groups, of which the Curculionides, Cerambycidae, and Lepturae are the respective types.

LONCERIA, a genus of plants named after Adam Lonicer, who was born in 1589 and died in 1668. He practised as a physician at Frankfort-on-the-Main, and wrote a Herbal, which was merely a compilation of what had been done by others. There is also a John Lonicer mentioned who wrote a commentary on Dioscorides.

This genus is the type of the natural order Caprifoliaceae, and has the tube of the calyx 5-toothed, the corolla tubular, campanulate or funnel-shaped, with a 5-leafed usually irregular limb; 5 stamens; a filiform style, a calyptra stigma; 3-seeded berries, and crustaceous seeds. The species are erect or climbing shrubs, with opposite exstipulate leaves and axillary flowers. There are about 60 species of Lonicerus, many of which have handsome flowers and emit a delicious perfume.

L. caprifolium, Goatseale, or pale perfoliate Honeyuckle, has ringlet whorled terminal and sessile flowers, deciduous obtuse leaves glabrous on both sides, the stem and calyx-base perfoliate, the style glabrous. It has a twining stem, with white or purplish flowers and orange-coloured berries. It is native of the middle and south of Europe, and is found on woods and thickets in many parts of England and the south of Scotland.

L. Periclymenum, the Woodbine, or Honeyuckle, has climbing branches, the leaves all separate, deciduous, sometimes downy, glabrous beneath, ovate, obtuse, entire, the stem tinged at the base, upper ones the smallest; the heads of flowers all terminal ovate, imbricated; the flowers ringlet. The flowers are pale yellow, the berries red, and accompanied with permanent bracts. This plant in early times was supposed to possess powerful medical properties, but it is not now used. It is however extensively cultivated in the gardens and shrubberies of Europe on account of the delicious perfume of its flowers. This plant is the true 'woodbine' of the poets, and Milton has applied to it the name 'twisted eglantine.' This plant has obtained the name of woodbine, a corruption of wood-blind, from its habit of twisting round the stems of trees.

Thus Shakspeare says—

So doth the woodbine, the sweet honeyuckle, Genly entwine the maple.

The name honeyuckle is derived from the habit of children, who draw the corolla out of the calyx, and suck the collected honey from its nectary. Several varieties of this plant are recognised by botanists. All these are beautiful climbers and extend from
This plant is a native of Georgia, about Telis, and is a neat little bush with which to form garden-fences.

LORANThUS (from lorum, 'a strip of leather,' and alatus, 'having wings,' alluding to the linear shape and leathery substance of the petals), a genus of plants the type of the natural order Loranthaceae. It has dicoccous or homopodite flowers, the calyx cup-shaped, adnate, with an entire border, the corolla 5-lobed, linear, reflexed stamens inserted into the middle of the petals; the filaments short, anthers globe-shaped; the style thickish; stigma simple; the berry globose, 1-celled, 1-seeded. The species are evergreen shrubs parasitic on trees.

L. Europaeus, the European Loranthus, is a glabrous much branched plant; the branches terete; the leaves opposite, petiolate, oval-oblong; the racemes terminal, simple; the flowers 5-petalled; the petals 5.

This plant is an evergreen parasitic plant, and has the habit of the common mistletoe (Viscum album). It is a native of the southern parts of Europe, and is found on the oak, but inhabits no other tree.

This 'circumstance,' says Burnett, 'has led some naturalists to suppose the Loranthus to have been the Mistletoe of the Druids, and to believe, as it is not now indigenous to Britain, that when Druidism was suppressed, every vestige of that stultuous superstition was so completely swept away that even the sacred plant was extirpated here.' The fact however of the scarcity of the mistletoe upon the oak renders it probable that it was on this account more sought after, and thus contributed to render it an object of superstitious veneration. Several other species of Loranthus have been described, but none of them are easily cultivated, on account of their parasitical habits. L. Loranthus, like those of the mistletoe, contain tannin, and are astringent.

BURNETT, *Outlines*, LOUDON, ARBORETUM ET FRUTICETUM.

LORDS ACT. (REVOLUTION, P. C.)

LORENZI, also BERNETTO, AMBROGIO and PIETRO DI, two celebrated Italian painters of the fourteenth century, were born at Siena about the year 1300. They were brethren, as we learn from the following inscription formerly in the hospital of Siena: 'Hoc opus fecit Petrus Laurentii et Ambrosius eius frater, 1380.' It was attached to pictures of the Presentation and of the Marriage of the Virgin, which were destroyed in 1720; and was preserved by the Cav. Pesci. This inscription explains the name given by Vasari to Pietro, whom he calls Petrus Laurentii or Laurentius, which is evidently an erroneous reading of Petrus Laurenzi — P. S. LAMIO.

Some of the works of these painters still remain, though the principal of their works, by Ambrogio, which is described by Ghiberti (in 'Cod. Magliabechiani,' f. 8 & 9), is destroyed. The picture painted in the Museum at Siena and representing the fatal adventures of some missionary monks. In the first compartment a youth was represented putting on the monastic costume; in another, the same youth was placed, in spite of several of his brothers, about to set out for Asia, to convert the Mohammedans; in a third, these missionaries are already at their place of destination, and are being cheated in the Sultan's presence, and are surrounded by a crowd of soldiers and by a crowd of infidels; the Sultan judges them to be hanged; in a fourth, the young monk is already hanged to a tree, yet notwithstanding he continues to preach the gospel to the astonished multitude, upon which the Sultan orders their heads to be cut off; the next compartment is their ceremonial execution by the sword, and the scaffold is surrounded by a great multitude of foot and on horseback; after the execution follows a great storm, which is represented in all the detail of wind, hail, lightning, and tempestuous weather.

The picture of St. Nicholas in the public palace of Siena, a tempera painting of Peace, represented by a view within and without the city of Siena, with numerous inhabitants variously occupied in business and in pleasure. War was likewise represented in this hall, but is now defaced; there are however other allegorical works still remaining, and Rumohr observes that what remain justify Ghiberti's praise of what have disappeared, speaking with relation to the time of their production — 1393.

Of the several pictures by Ambrogio Lorenzetti mentioned by Ghiberti, only one remains —- the Presentation of the Virgin in the Temple, in the Scuola Regie, and in this same school, the Vision of St. Francis, which, says Ghiberti, was painted in fresco, by one of his pupils, but is now defaced.

Ghiberti does not mention any works by Pietro Lorenzetti, and there is only one authenticated work by him; it is in the Stanza del Filone, a room against the sacristy of the cathedral of Siena, a picture of 'The Assumption of the Virgin,' and the pixittá, a MCCCXXII.' It represents, according to Rumohr, some passages from the life of John the Baptist, his birth, &c.

Vasari mentions many works by Pietro in various cities of Tuscany, where he says his reputation was greater than that of any other Cinabrio's or Giotto's. He attributes to him a picture of the early fathers and hermits in the Campo Santo at Pisa; it is engraved in Lazzini's 'Pitture del Campo Santo di Pisa.' In 1317 he is said to have gone to Rome to paint the cathedral, in which he painted in fresco twelve stories from the life of the Virgin, with figures as large as life and larger, but they have long since perished; they were however in good preservation in the time of Vasari, who completely restored them.

He speaks of parts of them as superior in style and vigour to anything that had been done up to that time.

The works of these painters, though relatively good, are not exempt from any of the errors and defects of the prevailing style in Italy previous to Donatello, Masaccio, and Ghiberti; and they display even some of the barbarities of the Byzantine school. Several pictures are attributed to them in various collections, but wholly without evidence as to their authorship.

(Vasari, *Vite de Pittori, sc.;* DELLA VALLE, *Lettere Scelte di Bartolommeo da Pizzighettone, sc.;* and many others in *Italienische Forschungen, in which the two Lorenzetti are treated of at considerable length."

LOSS ISLANDS. (SIEBRA LEONE, P. C.)

LOVAT, LORENZO, a celebrated Venetian painter of the sixteenth century. He is supposed to have been one of the scholars of the Bellini, and also an imitator of Leonardo da Vinci. He lived long at Bergamo and was generally considered a native of that place; but,' says Lanzi, 'we are indebted to Sig. G. Beltramemi for showing, in a work published in 1800, that Lotto was a native of Venice.' He found him thus noticed in a public contract, 'M. Laurentius Lottus de Venetiis nune habitator Bogomini — Master Lorenzo Lotto, of Venice, now a resident of Bergamo. Lotto lived also some time at Trevigi, at Recanati, and at Loretto, where he died. His works range from 1513 to 1557. As an opera it is said that Lotto's best works could scarcely be surpassed by Raphael or by Correggio, if treating the same subject. His masterpieces are the Madonnas of S. Bartolommeo, of S. Andrea, and S. Giovanni in Bergante. (Vasari, *Vite de Pittori, sc.;* TASSI, *Vite de Pittori, sc.;* Bergamaschi; Lanzi, *Storia Pittorica, sc.*}

LOVAT, LORD. Simon Fraser, afterwards Lord Lovat, was born 1606, a soldier near Pitmen in Scotland. He belonged to the family of the Frasers, who were powerful as early as the reign of Malcolm IV. about 1153, and who had large possessions in Tweeddale and elsewhere in the south of Scotland, and whose last male issue lived until that son was very young. After receiving the usual instruction at a grammar-school, he was sent to the University of Aberdeven,
where he distinguished himself by his accomplishments in this direction.

In 1692 Fraser, through the interest of the Marquis of Athol, received a commission as captain of a company in Lord Tulloch's regiment, but soon afterwards resigned to return to his father's farm near Gogar, about five miles south of Edinburgh. His father, the eldest daughter of the last Lord Lovat, and claimed the estates for her. Simon Fraser, on the contrary, asserted his own right, as nearest male heir, not only to the estates of Gogar, but to the rest of the family. In winning clandestinely the affections of the heiress, then fifteen years of age and living with her mother, the dowager Lady Lovat, near Inverness, and she consented to elope with him, he was caught by her father, and put in a cell to conduct her changed his mind, took her back, and disclosed the plot to Lady Lovat. The heiress was immediately sent under an escort to Dunkeld, the seat of the Marquis of Athol. Fraser made some daring efforts to obtain possession of her, but without success.

About 1700 Fraser went to France, and to ingratiate himself with James II., then living at the court of St. Germain, formally renounced the Protestant faith, and embraced that of the Roman Catholics. James II. having died in 1701, his son, James Francis Edward, resolved to make an attempt to regain his father's kingdom, and Fraser was appointed by the courts of Versailles and St. Germain to stir up an insurrection in the highlands of Scotland. He was made a colonel (some say a major-general), was furnished with credentials to treat with noblemen, gentlemen, and chiefs of clans, and was supplied with a sum of money, for his own expenses, and a certain number of muskets, and landed in Scotland about the end of 1702. He pretended to perform his engagement, but after his return to France in 1703 it was discovered that he had abused his trust, and had disclosed the plot to the Duke of Queensberry. He was confined in the Bastile, where he remained till 1706, when, in order to obtain his release, he offered to enter into holy orders. By the influence of the pope's nuncio and other Roman Catholic ecclesiastics he was set at liberty, he at once retired to St. Omer, entered the College of Jesus, and discharged for some years the duties of a priest with apparent sincerity and much discipline. But his disposition and the advice of his confessor caused him to leave the religious vocation.

When the Rebellion broke out in 1715 Fraser repaired to London, and with some difficulty and risk got to the highlands of Scotland under the assumed name of Captain Brown. His great object was to obtain his hereditary estates; a large part of the clan of the Frasers received him as their chief, and were willing to act according to his decision; and as Fraserdale, who had married the heiress and held the estates, had joined the Pretender, Fraser adhered to the king. He took Inverness from the rebels, and after the Rebellion was suppressed his services were rewarded with the title of Lord Lovat and the grant of the forfeited estates.

His father and mother were the Earl and Countess of Fife. Fraser was the second son of the Laird of Grant, and by her had two sons and two daughters, who survived him. His wife having died, he married a young lady nearly related to the Argyle family, and had a son by her, but his nature was such as to make him deserted. In consequence he was appointed governor of Inverness and lord-lieutenant of Inverness-shire, and lived in tolerable quietness till the second Rebellion broke out in 1745, when he joined the side of Charles Edward, the young Pretender, but kept himself at home, and sent his son with the Frasers, pretending, in his reply to the Lord President, who, on the 28th of October, 1745, wrote to reproach him, that his son had acted without his authority; there was however abundant evidence of his participation, and he fled and concealed himself in the wildest parts of the Highlands; after many escapes he was caught, and conveyed to London. There he was imprisoned, and then was brought to trial till March 9, 1747. The trial lasted seven days, and he was then found guilty, and sentenced to be beheaded. Both before and after his trial he amused every one near him with his jokes. On the 9th of April, 1747, he was led to the scaffold on Tower-hill. He was then eighty years of age, and after sitting awhile in a chair, and talking deliberately to those about him, he laid his head quietly down on the block, and was quickly dispatched. When his body was brought up, his fat neck and his usually short hair, his head was cut off at a single blow. Horace Walpole, who was present, says, 'He died extremely well, without passion, affection, affection, apoplexy, or timidity, his behaviour being natural and pleasing.'

LOU

LOUDON, JOHN CLAUDIGUS, was born at Cambuslang, in Lanarkshire, on the 8th of April, 1810, where his mother's only sister lived. He was the son of Dr. Claudius Buchanan, author of 'Christian Researches in Asia,' then residing. His father was a farmer, and lived at Kerse Hall, near Gogar, about five miles south of Edinburgh. As a child Loudon exhibited a taste for gardening, and as a principal pleasure was in making walks and beds in a little garden his father had given him. He was early sent to reside with an uncle at Edinburgh, in order that he might be educated, and here he attended a public school, and also the classes on botany and chemistry. In addition to the Latin he learned at school, he obtained a knowledge of French and Italian, and paid his master the tribute of many dear lessons from these languages, which he sold. At the age of fourteen he was placed with a nurseryman and landscape gardener, and continued his attendance on the classes on botany and chemistry, and to these added agriculture, in the university of Edinburgh. During this period he acquired the habit of sitting up two nights every week for the purpose of study, a habit which he continued for many years.

In the year 1800 Loudon first published a periodical, and as he brought good recommendations from Edinburgh, he found no difficulty in getting employment in his profession of a landscape gardener. One of his earliest literary efforts was made this year in the publication of a part of a paper in the 'Agricultural Journal,' entitled 'Observations on laying out the Public Squares of London.' It was the practice when this article was published, to adorn the squares of London with a very sombre vegetation, as the years were fresh, and the street gardens of plants. This practice the author strongly condemned, and recommended the lighter trees, as the oriental plane, the sycamore, the elm, and others, which were generally cultivated, and added a great deal to the beauty of the London spaces. In 1804 he returned to Scotland, and in the same year he published his first work, entitled 'Observations on the Formation and Management of useful and ornamental Plantations,' 8vo., London. He returned to England in 1805, and published a small work, entitled 'A short Treatise on some Improvements lately made in Hothouses,' 8vo., Edinburgh. In 1806 he published 'A Treatise on foraging, or the subject of managing Country Residences, and on the choice of situations appropriate to every class of Purchasers,' 8vo., London. This work was illustrated with thirty-two copper-plate engravings of landscape scenery drawn by the author.

He always took his mind as the most important of all the cultivated sciences in the cultivation of this estate, and as a result of his observations he published several volumes on the subject, and at the same time, in his treatise on 'The Utility of Agricultural Knowledge to the Sons of the Landed Proprietors of Great Britain,' he showed how the Scotch Farmer, now farming in Middlesex, This led to his introduction to General Straton, the owner of Tew Park in Oxfordshire, and his undertaking the management of this estate as a tenant. Here he established a kind of agricultural college, in which he engaged to teach young men the principles of farming; and in 1808 he wrote a pamphlet on the subject entitled 'The Utility of Agricultural Knowledge to the Sons of the Landed Proprietors of Great Britain,' &c., by a Scotch Farmer and Land-Agent. He carried on his farming so successfully that in 1812 he found himself worth 15,000l., and being more anxious for the cultivation of his mind than the improvement of his circumstances, he determined to give up his farm and travel on the Continent. He left England in March, 1813, and after visiting the principal cities of Germany and Russia, he experienced a variety of adventures, and recording with his pen and pencil all that he found worthy of notice in his own profession, he returned to his own country in 1814. On his return to London, finding the trade in the chief part of the world was very depressed, he passed through unfortunate investments, he devoted himself with renewed energy to his old profession of landscape-gardening. He now determined to publish a large work on the subject of gardening; and having completed the work, the advantages of terraced gardens, for the purpose of rendering his work more valuable, he visited France and Italy in the year 1819. In the year 1822 appeared his great work, 'The Encyclopaedia
of Gardening,' which contained not only a vast amount of original and valuable matter on every department of horticulture, but was copiously illustrated with woodcuts in the text. This work had a very extraordinary sale, and fully established the author as one of the most learned and able horticulturists of his day. A second edition was published in 1824. The success of this work led him to engage in another equally laborious and extensive work, and on the same plan, devoted to farming. This was published in 1825, with the title 'Encyclopedia of Agriculture.' Another work, though not exactly on the same plan, but similar in design and purpose, was edited by him and published in 1829, with the title 'Encyclopedia of Plants.' This work however contained less of the author's own work than the preceding, the plan and general design being all that he claimed to his own. This was followed by another, 'Encyclopedia of Cottage, Farm, and Villa Architecture,' which was all his own labour. 'The labour,' says Mrs. Loudon, 'that attended this work was immense; and for several months he and I used to sit up the greater part of every night, never having more than four hours' sleep, and drinking strong coffee to keep ourselves awake.' This book was published in 1832, and was very successful. He then planned a work of still greater extent, which demanded more time than any of the preceding: this was his 'Arboraeum et Fruticetum Britannicum;' comprehending an account, with engravings, of all the trees and shrubs growing wild or cultivated in Great Britain. This work was thought out in 1837, and, with the preceding, was published at his own expense. After paying artists and other persons engaged in the work, he found at its conclusion that he owed ten thousand pounds to the various engravers, and that he himself had been employed. The sale of this work was slow, and seemed to have involved him in pecuniary difficulties, which, although they did not abate his energy, still preyed upon his mind, and hastened his end.

During the time that these works were going on he edited several periodicals. In 1826 he established the Gardener's Magazine, which he carried on till his death. In 1828 he commenced the Horticulturist and Journal of Agriculture, which was published to 1837, when it passed into other hands. In 1834 he started the Architectural Magazine, which he gave up in 1836. In 1836 he commenced the Suburban Gardener, a monthly publication; so that he had four, monthly works, in addition to the 'Arboraeum,' going on at the same time.

These labours would appear very extraordinary for a man in perfect health and with the use of his limbs, but they become more extraordinary when the circumstances are known under which he wrote them. His first attack of rheumatic fever, in 1806, was so severe as to produce permanent anchylosis of his right wrist, which seriously impaired his ability to write, and this was so severe that after trying the usual remedies he was induced to submit to shooping, during which process his arm was broken so close to the shoulder as to render it impracticable for him to use the pen. He kept on and on a subsequent occasion it was again broken, when it was found necessary, in 1826, to have recourse to amputation. In the meantime his left hand became affected so that he could only use the third and little finger. After this period he was obliged to employ for all his works both an amanuensis and a draftsman. With this infirm and maimed body, his mind retained its vigour to the last. Early in 1843 he was attacked with chronic inflammation in his lungs, which terminated his existence on the 14th of December of that year. He continued working till the day of his death, and died standing on his feet.

In literary men have attempted or executed so much as Loudon, and that under circumstances of the most depressing and afflictive nature. The tendency of his mind was essentially practical, and in this will be found the cause of the success of each of his works. As to his work on gardening he displays great anxiety for the mental improve-
ment and welfare of the class of men who make this their occupation; and the book on which he was employed at the time of his death was entitled 'Self-Instruction for Young Gardeners.' In all his works he never lost the opportunity of pointing out the bearing of his subject on the moral and social improvement of his fellow-creatures. He was married in 1811, and has had one daughter. Mrs. Loudon is the author of 'The Mummy;' 'Ladies' Flower Garden;' 'Ladies' Botany,' &c. The materials for this notice have been chiefly collected from a Memoir by Mrs. Loudon in Self-Instruction for Young Gardeners.' A complete list of Loudon's works is given in the 'Proceedings of the Linnean Society' for 1844.

LOVELACE, RICHARD, born in 1618, was the son of a Kentish knight. Educated at King's College, Cambridge, and at Oxford, he was placed at the Harvard, and entered in 1646 under the patronage of Goring. On the close of the civil war, he retired to his paternal seat, Lovelace Place, near Canterbury, where he continued to reside till his death. He was created a peer of Ireland in 1661, and was made a baronet in 1673 by the king to the Long Parliament; and for doing this he was imprisoned in the Gatehouse, and released only on giving bail in forty thousand pounds. In 1648 he raised a regiment in the employ of the Duke of York, and was made a major in Dunkirk: and it is said that the lady he married in his poems married another person, on a false report that Lovelace had died of his wound. Returning to England in 1648, he was again in the army by another force, and died after the king's death. In 1649 he published a volume of poems, entitled 'Lucretia's Odes, Sonnets, Songs,' &c. He had spent his fortune freely in serving the royal cause. He now fell into embarrassment and sickness, and lived for some years wretchedly. He died of consumption, in a mean lodging in London, in 1658. Lovelace was the author of two plays, which have never been printed. His lyrical poems, with much inequality and many other faults, are full of spirit and vigour. Specimens of them are in all the common collections; and one or two of them, such as the fine verse 'To Althea from Prison,' furnish some of the most haughty and Tecumseh scenes. LOWELL, a large manufacturing city in the United States of North America, is situated in the State of Massachusetts, on the south bank of the River Merrimack, where the Concord River joins it. It is 16 miles from Boston, 121 miles from Philadelphia, W. long., 489 miles from Washington, and 26 miles north from Boston by the railway. The site was formerly the head-quarters of the Pawtucket Indians, whose territory extended to the north of Massachusetts Bay, and included the present State of New Hampshire. The Pawtuckets amounted to about 12,000, and Wamesit, their chief town, was at the junction of the Concord River with the Merrimack, where the road from New Hampshire first visited by the Europeans about 1650, the population of Wamesit was about 3000; but the Pawtuckets rapidly gave way before the white settlers; in 1674 the population of Wamesit was reduced to 250 men, besides women and children. The lands belonging to the Pawtuckets on the west of the Concord River were given up in 1686, and those on the east in 1726. The banks of the Merrimack were covered with a forest, and it soon became an object of importance to float the timber, lumber, and fuel which it furnished down the river to Newburyport. In doing this the chief difficulty was in passing the falls, which were about thirty-two feet over a series of rapids. On the 27th of June, 1792, an act was passed which constituted certain persons into a body politic and corporate, by the name of the Providence Water Company, and gave them the privilege of fixing their works westward of the Merrimack falls. The works was forthwith commenced, and was completed in 1797; it extends from the Merrimack just above the Pawtucket Falls, in a sweep of a mile and a half, to the Concord River, near the point of junction of the Concord with the Merrimack. The descent of thirty-two feet was accomplished by four locks. Into this canal the whole stream of the Merrimack could be turned, and might thus afford an immense water-power, perfectly under control, to be applied to manufacturing purposes. For upwards of twenty years this vast water-power seemed to have been little noticed. In 1813 a cotton manufacture was erected on the Concord River, a little above the canal, which was increased in 1818 into a woollen manufactory comprising 250 looms, and were very successful. The Waltham Company, having discovered the use which might be made of the water-power of the Pawtucket Canal, purchased the shares of the Concord River Company in 1822, and incorporated under the title of the Merrimack Manufacturing Company. They enlarged the Pawtucket Canal, making it sixty feet wide and eight feet deep, and connecting it with the Merrimack by a cut, and the Pawtucket Canal to the Merrimack River, and on this latter canal the first manufactories were erected in 1823. The town was at first called East Chelmsford, and in 1830 contained 200 inhabitants. In 1826 the number of inhabi-
L O W

LOY

ants had increased to 2500, and on the 1st of March in that year East Chelmsford was incorporated into a town called Lowell. Frankfort and Lowell were at this time the son of the Hall, John Lowell, LL.D., and was born in 1774, in Newburyport, Massachusetts. In 1810 he visited England, and on his return he invented, in conjunction with Parker and others, a machine for the manufacture of cotton. This machine, adopted in Watervliet in 1812-13, the first power-loom which were brought into extensive operation in America, though upwards of twenty other machines had been patented at Washington previously. Lowell's company was incorporated in 1829; and on the death of the firm before mentioned, were afterwards transferred to Lowell. Mr. Lowell died in 1817, at the age of forty-three.

Such was the origin of Lowell, the population of which, in 1830, was only 3600; and in 1837 it was incorporated as the City of Lowell, and the population was then 17,683; in 1840 it was 20,921; and in 1844 it was 25,163; and is now (March, 1845) probably about 30,000.

Of this population about one-third, or 10,000, are persons employed in the cotton and woolen manufactories, or mills, as they are called, and of these about 7000 are females and 3000 males. One interesting peculiarity connected with the Lowell mills is the superior character of these female operatives, as they are called in America, or factory-girls, as they are called in England; and of this superiority a singular proof was afforded by the periodical work called 'The Lowell Offering,' a Repertory and Repository of Universal Interesting Subjects, produced by females actively employed in the Mills'; the first number of which appeared in October, 1840, and the first volume was completed in December, 1841. A second volume was completed in July 4, 1843; in 1844, the monthly selection from the two first volumes, under the title of 'Mind amongst the Spindles,' formed the second volume of the series of 'Knight's Weekly Volume,' in the editor's preface to which, and in a letter from Miss Martineau annexed to it, an interesting account of these female operatives is given.

There are about twelve large manufacturing companies, or corporations, besides several smaller companies. A brief description of the arrangements of a Lowell corporation is partly explain the means by which the moral if not the intellectual superiority of these girls is produced. On the bank of the river, or of one of the canals, stands a row of two, three, four, or five mills. A short distance from the mills are long blocks of brick boarding-houses, which are connected with the mills by a line of one-story brick buildings, containing the counting-room, superintendent's room, clerk's room, and store-rooms. The mill-yard is included in such a manner that access can only be had to the mills through the counting-room. On one side are the boarding-houses, which are let only to persons of approved character, and are entirely under the supervision of the company. No one is allowed to enter the rooms of the operatives, but distinct tenements are appropriated to each sex. The hour for taking meals is uniform throughout all the corporations. The number of hours which the mills run, and consequently during which the operatives are employed, taken on an average, is twelve hours ten minutes. The rate of wages varies. A young woman from the country, employed at first as a spare hand and in learning the business, receives fifteen cents per week besides her board. In a few months she will earn a dollar or a dollar a half per week, according to her dexterity and diligence. While however the average of the mill girls is about two dollars per week, besides board, instances are not uncommon of their earning three and four dollars per week, besides board. The payments are entirely by notes, converted into cash at the bank.

As connected however with the superiority of the Lowell female operatives, it is to be observed that they are quite a different class of females from the factory girls of England. The condition of the former is the most respectable brought up in farm-houses or elsewhere, and seldom remain more than three, four, or five years, when they return to their homes, and are succeeded by others in continuous succession.

There are in Lowell twenty-three regularly constituted religious societies, and they have erected about twenty churches. Connected with these societies are 6123 Sunday-school pupils and 1125 teachers, or an average of about 8.73 to each society. There is 1 High School, 8 Grammar-schools, and 30 Primary Schools; a City-Library, of which a catalogue of 5000 volumes has been printed; a Savings-Bank, incorporated in 1829, which has about $500,000 in deposits; 20 factory girls, the amount of whose funds at interest is estimated at 100,000 dollars. Two per cent. interest is paid for every six months. The Lowell Dispensary was incorporated in 1833; the Lowell Home Institution was established in 1839. There is a large Almshouse, a Poor-Farm, and a Geol. The Lowell Cemetery is on the east bank of the Concord River, a mile above its junction with the Merrimack; it comprises about 150 acres, and was opened in 1820. This Institution is in the care of the Lowell Institute is an association of gentlemen for the management of a course of lectures which are delivered every winter in the City-Hall, at which many of the female operatives attend.

The City-Hall, for town purposes, with committee-rooms and stores underneath, was completed in 1839; another public hall with reading-rooms and library-rooms was built in 1855 for the use of the Middlesex Mechanics Institution. In 1857 a large market-house was completed. There are two bridges over the Merrimack: one just below the Falls, called the Pawtucket Bridge; the other near the mouth of the Concord River, called the Central Bridge, which is connected with it by a new pier, with a new portion of town on the north bank of the Merrimack.

There are two railroads connected with Lowell. The Boston and Lowell railway, 26 miles in length, was opened in 1841; in 1842 it was extended to Nashua and Lowell railway is 14 miles in length; it paid a dividend in 1844 of 10 per cent.

The following table is given in the 'American Almanac' for 1845:

A pound of cotton averages 35.5 yards; 100 lbs. of cotton will produce 89 yards of cloth. Average wages of females, clear of board, per week, 1.75 dollars. Average wages of males, clear of board, per day, 75 cents. Average amount of wages paid per month, 135,500 dollars.

(Lowell, as it was and as it is, by the Rev. Henry A. Miles, 1845, Lowell, 1845; American Almanac, 1846; Knight's Weekly Volume, vol. i.)

LOXONE/MA. A group of spiral Gasteropoda is thus named by Phillips. The species occur in Silurian, Devonian, and carboniferous strata. (Palaeon: fossile: de denison.)

LOYOLA, IGNATIUS. Don Inigo Lopez de Recalde, more generally known under the name of Loyola, was the youngest child of Don Bertram, lord of Oignez and Loyola, a nobleman of high birth in the kingdom of Navarre. He was born in the year 1411, at the castle of Loyola, in that part of Spanish Biscay afterwards called the province of Guipuzcoa. In early youth he was attached to the court of Ferdinand and Isabel, and spent much time in the study of literature and the classics, and the recitation of psalms; but the vivacity of his disposition little suited him for a situation so devoid of excitement, while the recital of the noble deeds of the Spanish knights, who had lately freed their country from the dominion of the Moors, had exalted the spirit of the young man, and set him on the way to war, and afterwards received him in his
pilgrimage, in order that this severe penance might excite in his mind a deeper remorse for sin. On leaving Mount Serrat, he directed his steps towards Manresa, a small town within three leagues of this monastery. There he repaired to the hospital of St. Dominic, to assist the poor and sick, imposed upon himself a series of new and severe penances. His deeds of charity soon acquired for him celebrity in that town, and, though clad in the rags of destitution, he carried with him the profoundest and most important admiration of the multitude. To avoid the temptation of vain glory, he retired to a cavern hollowed in a rock at a short distance from Manresa, where he redoubled the severity of his penances, and on the day that he arrived, at that moment of inanimate exhaustion at the door of his cell, and was borne back to the Dominican hospital. On his recovery, his mind, weakened by mortifications and fasting, fell into a state of spiritual despondency. His doubts and despair, his fears and temptations, are described with edifying minuteness in his own writings and by his early historians. It does not appear that any particular doctrine had made its impression on the mind of Loyola, as that of justification by faith alone had made on that of Luther. He lived, as it were, within himself, and his emotions were actuated by the alternate inspirations of spiritual anxiety; he has taught us in his 'Spiritual Exercises,' the manner in which he distinguished their influences; the soul being gladdened by the one and depressed by the other.

One day, at length, he awoke as from a dream, his imaginings had portrayed to him the figure of a heavenly messenger. With tears of joy, he gratefully acknowledged the blessings vouchsafed to him, and, refreshed in spirit, he arose a new and a mightier man.

Afterwards he dreamed of a voyage at which he would have been glad to be present. A great king was sailing on the sea, and he heard the people of the city in which he lived, shouting, "May God have mercy on this city!" The king, they said, would one day reign over the waters of the ocean. He awoke with the hope that within a year he would be at sea. He soon afterwards received orders from the general in Spain, to go to the Low Countries, to the court of the Duke of Parma. He was appointed an envoy to the court of France, and he accordingly went to Paris. From there he went to England, and then to the Low Countries. In the Low Countries he settled for some time in Brussels, and then went to Flanders. In Flanders he stayed for a time, and then went to Spain. From Spain he went to Paris, and then to England again. From England he went to Italy, and then to France again. From France he went to Switzerland, and then to the Low Countries again. From the Low Countries he went to Spain, and then to Portugal. From Portugal he went to Africa, and then to India. From India he went to China, and then to Japan. From Japan he went to the New World, and then to the Far East. From the Far East he went to the New World again, and then to the Far East again. From the Far East he went to the New World again, and then to the Far East again.
friends were published by the dishonesty of a fellow-student, and he was again compelled to have recourse to begging for his subsistence. He, however, zealously applied himself to the studies of the University; obliged to recommend his rules, he became well known in the University for the principles of philosophy brought to perfection by the Scholastics. He could be admitted as a theological student, he placed himself in the class of the youngest and least advanced scholars, and besought their teacher to treat him as one of their juniors. In the early course of his studies, he was later engaged in the laborious acquisition of knowledge, and partly in the endeavor to obtain a salutary influence over his companions. In the latter permit he was eminently successful. Two students of the University, Honoratus (the holy Art. Jasurra), a native of Savoy, of humble origin and simple manners, and Francis Xavier of Narvare, of noble ancestry and aristocratic demeanor. These young men, of such different dispositions and habits, were the first-fruits of Loyola's labors. From that time the three companions formed the closest intimacy, dividing their gains, and sharing each other's toils. Shortly after three more students acknowledged the influence of Loyola, and joined his small society: their names are recorded in the article Jasurra, F. C. On 16th August, 1534, they assembled together at the Church of Montmartre, in one of whose subterraneous chapels Faber, who was a priest, administered to them the sacrament of the Eucharist. They then took the solemn vows of chastity, absolute poverty, devotion to the care of Christians, and to the conversion of infidels. They then resolved on proceeding to Jerusalem, but the case was not in favor of their proposal. This object should be put in their way, they decided upon placing themselves under the guidance of the Pope, and implicitly submitting to his directions. Such was the humble origin of the famous Congregation of the Jesuits. They placed themselves under the banners of Jesus, as soldiers under their chief. The history of the founder now becomes mingled with that of the Order itself. Its early progress, the opposition it met with, the history of its success, and the rules and constitutions by which it is governed, are fully and clearly detailed in another part of this Cyclopaedia. [Jasurra, F. C.]

We will only, therefore, briefly state the principal events in Loyola's life which are not alluded to in that article.

After revisiting his native country, where he religiously repaired the effects of some early faults, he proceeded to Venice, in which city he was joined by his companions, and from thence proceeded to Rome. Their intended departure for Palestine was interrupted by the war which broke out, in 1537, between the Venetians and the Turks; they therefore presented the offer of their services to the Pope of Rome. They were gratefully accepted by the reigning pontiff, who gladly availed himself of the support of a society of men full of spirit and zeal, and capable of the performance of the duties of implicit obedience to his orders. Deeply struck by open schism and lurking disaffection, the Church of Rome found an unexpected source of strength in her own bosom, a source in the society of the Jesuits which she had formed. (Italiam.) On the 27th September, 1540, Paul III. published a bull sanctioning, under some limitations, the establishment of the Order; another was finally issued in 1545, which removed those limitations, and made the sanction unconditional. Meanwhile six of the oldest members met together to elect a president subject to no control but that of the See of Rome; their choice fell on Loyola. He remained at Rome as the centre from which he was to control and direct the movements of the Society. His time was spent there in revising its rules and constitutions, and in works of charity. He founded an asylum for the protection of Jews who had been compelled to renounce their faith, and to whose victims of sensuous seductions might, without binding themselves by any religious vow, lament their sins and reform their lives. In the year 1546 Francis Borgia, whom the Church of Rome had sent to found an asylum in Spain; the statutes were drawn up by Loyola, and the same privileges were accorded to it which belonged to the Asylum of Salamanca. Not twenty years had elapsed since the foundation of the Society at Loyola, then a poor and despised student, had been contumaciously expelled as a factious and illiterate pretender. On the 11th July, 1556, this extraordinary star, worn down by infirmities and self-inflicted mortifications, left a world which for so many years he had looked upon only as a scene of charitable labors. It was a useless task to attempt a delineation of Loyola's character; it is best known by his works. Whatever difference of opinion may be entertained respecting the order of the J'suita, there can be but little respecting their founder.

The memory of Ignatius was conserved by a ceremony known in the Church of Rome by the name of the Feast of St. Ignatius, celebrated annually on the 31st of July, 1609, and he was canonized as a saint by Pope Gregory XV. in 1622. His festival is celebrated on the 31st July.

His Life has been written by Gonzales and Ribaden.dera, two of his early historians, by Jacques de Maffres in Latin, Bartoli, and Bouhouns in French. His 'Spiritual Exercises' were published at Rome in 1548, and have been translated into French by Drooto de Maupertuis and Cioenue. His 'Maxims' were translated at Paris in 1668.

An elegantly written sketch of the life of Ignatius Loyola is contained in 'The Portrait Gallery' published by Knight, vol. vii. By a misprint in this sketch of Knight's, his death is made to take place in 1666. Further information respecting him may be obtained in Ranke's 'History of the Popes,' vol. i. p. 181-200 of Miss Austin's translation; Allan Butler's 'Lives of the Saints;' Fabre's Continuation of Fleury, vol. xxvi.; De Thou, 'Hist. Universelle,' vol. iii.; and Bayle, 'Dict. Historique.' Bayle is chiefly useful in correcting some errors of preceding writers; but the whole is written in a cold and sarcastic spirit.

LUCA'NIDAE, is the family of Stag-beetles, a name popularly applied to these insects on account of the very large and powerful mandibles with which the males are furnished. These in the genera Lamprinus and Picopodes equal the entire length of the body, and in the Luranus cervus of our own country are very formidable instruments of offence. They live during the day in the trunks of trees and old wood, and take flight at night. They are of great number; three to four species have been described as males, which fight with great ferocity among themselves for possession of their mates. The larvae, which is supposed to have been the animal called Cosus by the Romans, and emasculated by itself as a delicacy, lives in the willow and the oak, and remains untransformed for several years. When full-grown it forms a cocoon of the dust of wood which it has ground down by its powerful jaws, and after remaining some time as a pupa it undergoes its final transformation to pass a very brief portion of its life as a perfect insect. Some of the foreign genera of Stag-beetles are remarkable for their brilliant coloring. In Britain we have four species which belong to as many genera. (See Westwood's 'Introduction to the Modern Classification of Insects,' vol. i., and the writings of Macleay, Kirby, Roseel, and Hope.)

LUERNAL MICROSCOPE. This is a hollow pyramidal box, of wood, at the smaller extremity of which is a tube carrying the usual system of lenses for magnifying objects at a distance. At the other end, opposite to the objective, there are two lenses in frames, these, as well as those of the small lenses at the opposite extremity, being coincident with the axis of the box; and between the exterior of the two lenses, and the eye of the observer, there is a plate of glass, rough-ground on one side, which serves as a screen to receive the rays of light proceeding from the object whose representation is to be viewed: the object is fixed in a small frame, as usual, and is placed in a groove made for the purpose immediately beyond the tube containing the system of lenses, at the small end of the pyramidal box.

This box, the axis of which is in a horizontal position, is mounted on a brass stand, which may be placed on the floor or on a table, and the parts of the apparatus are capable of being correctly adjusted by means of screws. The instrument was invented by Mr. George Adams, a distinguished optician in London, and made by him for his own use. He procured objects being projected on the ground-glass screen by the rays of light transmitted from a lamp through the lenses, the observations being made by night or in a darkened room.

The correct adjustment of the instrumental parts is regulated by the achromatism of the lenses at the object end of the instrument, a subject which has been treated in the article Microscopes, F. C.; and therefore it will be sufficient to notice here only the means employed to enlighten the field of view.

For this purpose, in general, an Argand lamp is placed beyond the object, with respect to the microscope; or, if the light is not sufficient, two or more such lamps are placed: the light, after passing through a hemisphere of glass, is, when an opaque object is to be viewed, made to fall in a convergent state upon a small concave mirror, which is so inclined as to reflect the light back upon the object; and
from the different points on the surface of the latter the pencils of rays proceed through the object-lenses and the box to the glass screen.

By the refraction of the light in passing through the lenses a magnified image of the object is formed; and several persons may then place themselves so as to see the image on the screen at the same time; or, by placing the eye at a small aperture in the produced axis of the instrument, one person may, with a pencil, draw on the glass, or on tracing-paper laid over it, the figure of the object; it being understood that, by means of the proper adjusting-screws, the rays in each pencil are made to unite accurately in one point outside the box.

When the object to be viewed is transparent, the light is made to fall in a condensed state upon it, after having been transmitted through a convex lens, or two such; and, from the object, the rays proceed as before to the screen through the system of lenses which constitute the compound object-glass of the microscope, and through those at the opposite extremity of the box.

Instead of having a plate of ground-glass to receive the image, the pencils of light from the object, after passing through the lenses, may be allowed to fall on a board painted white or covered with white paper; the distance of the board from the instrument (about 6 or 8 feet) being such that the rays in each pencil may converge to a point upon it: thus there will be obtained a greatly magnified image of the object, which may be observed by many spectators at one time. It is said to have been used in a segment of a hollow sphere, the light being received on its concave surface; for by that construction the image will be nearly equally distinct at the centre and about the margin.

A lapal microscope, which was presented to the genio of Vesalius by Dr. Lieberkühn in 1738, produces a greatly magnified image of a small object in a similar manner by means of the sun's light. It consists of a coriell tube fixed by its base to a frame of wood, and the latter being screwed to a closed window-shutter at an aperture purposely made in the latter: the tube projects into the room, which, when the observations are to be made, is rendered quite dark, and is sometimes lined with black paper. The rays of the sun are conveyed by a system of lenses contained in the tube, as in other microscopes. On the exterior of the window is a frame carrying a rectangular piece of looking-glass; this frame is attached by a joint at one of its sides to a ring of wood or brass which is made to surround the aperture in the shutter. The mirror, by turning on the hinge, is capable of being fixed at any angle with the wall of the building; while the ring to which it is attached can, by means of a rack and pinion, be made to turn on the horizontal axis of the instrument, so as to permit the rays of the sun, whatever be the position of the latter, to be reflected into the tube. By means of lenses disposed for the purpose, the rays are made to converge on the object; and from thence, after refraction through the system of object-glasses, they proceed to a screen on which they depict the magnified image.

When the object is transparent, the rays of solar light are allowed to pass from the mirror directly through the lenses to the screen; but when it is opaque, a convex lens placed at the aperture in the window-shutter causes the solar rays to condense on a small mirror placed in a box at that end of the instrument which is within the room, and from this mirror the rays are reflected to the object. The condensed light thus thrown on the object diverges from thence and passes through the system of lenses, by refraction in which the magnifying power is produced; these lenses being placed in a tube which, as well as the object, is within the box containing the mirror lens. It is, however, but a little above either side, so that the rays of light proceeding from the object to the magnifying lenses may not be intercepted.

The mirror by which the sun's light is reflected into the microscope is on a pivot connected with a clock-work appara-
tus, by which its position is continually varied correspond-
tionally to the apparent change of the sun's place; and thus the reflected light is made constantly to pass through the two system of lenses, (C. C.)

Sir David Brewster has given, in his 'Treatise on New Philosophical Instruments,' p. 405, &c., a method of preparing objects of natural history for observation by the microscope that may perhaps form a perfect shape and colour, and be thus seen to the greatest advantage.

The solar microscope will, probably, never be generally employed, on account of the necessity which it involves of having an apartment particularly situated, and of being used only when the sun shines. The lacernial microscope can, of course, be employed at any time; and if, for an Argand lamp, the oxy-hydrogen light be substituted, the lenses also being achromatic, there can be no doubt as to the distinct and correctly defined.

[Luchetto da Genova. [Cambrario, Luca, P. C. S.]]

Lucuma (a native name for one of the species), a genus of plants belonging to the natural order Sapotaceae. It has a 5-parted calyx; 5-leafed corolla; 10 stamens, 5 of which are sterile, and 5 fertile, alternating with each other; as ovary is composed of 5 carpels, the fruit large, horned, marked by a large umbilical areola without albumen. The species are trees, yielding a milky juice, with scattered entire coriaceous leaves, and 1-flowered axillary or lateral peduncles.

Mammee, the Common or Mammee Sapota, has obvate lanceolate, oblong cuspidate, glabrous leaves, with solitary flowers. This plant grows from fifty to one hundred feet in height. It is a native of the tropical parts of South America, and of many of the West India Islands, where it is also cultivated. The fruit of this tree is eaten in the West Indies. It is of a large size, oval-shaped, and covered with a brownish rough skin, which in dryness is split off in a rough and luscious, and which, on account of its flavour, is called Natural Marmalade. P. Browne calls a variety of this tree Bully-tree, because it grows the tallest of all the trees in the woods of Jamaica.

Several other species of this genus have been described. They are all natives of various districts of South America, and yield edible fruits similar to the preceding species. They were at one time offered to the gardens of the species of which also yield edible fruits. [Achras, P. C.]

(Don, Gardener's Dictionary.)

Luci, Andre/A DI, commonly called L'Ingenno, and sometimes called Luci, was born at Assisi about the middle of the fifteenth century.

The common story of this painter, originating with Vasari, has been completely overthrown by Rumour in his 'Italianische Forschungen,' published by A. Sisoeby of Dresden. The story, which has been for some time in circulation, and which has been invariably followed by all subsequent writers on the subject, down to the time of Rumour, is that L'Ingeno was the rival of Raphael in the school of Pietro Perugino, that he became suddenly blind while assisting his master Perugino in the Sixtine Chapel, and that the then pope, Sixtus IV., granted the unfortunate painter a pension for life, which he enjoyed until his eighty-sixth year. Rumour has shown this account to be, with one exception, wholly incorrect; the only possible part of it is that L'Ingeno assisted Perugino in the Vatican; this he may have done, as he was his assistant in some works in the Camillo, or Exchange, of Perugia.

L'Ingeno, the pupil of Perugino's fellow-pupil with Perugino, for he painted only one year after the birth of Raphael, in 1484, a coat of arms for the town-hall of Assisi, where he was then established master. He also, after the death of Perugino in 1494, held official stations at Assisi, which can leave no doubt of his retaining his sight. In 1505 he was procurator; in 1507, arbitrator; in 1510, syndic—syndicat

Sir David Brewster has given, in his 'Treatise on New Philosophical Instruments,' p. 405, &c., a method of preparing objects of natural history for observation by the microscope that may perhaps form a perfect shape and colour, and be thus seen to the greatest advantage.

The most certain known work by L'Ingenno is the coat of arms already mentioned. The prophets and sibyls in the Camillo in Perugia are assigned to him, but it is quite uncertain what portion of the frescoes in the galleria at Bevagna, which been attributed to L'Ingeno more for a general aptness for business, than for any special skill in painting.

(Vasi, Vite dei Pittori, &c.; Lanzi, Storia Paitorica, &c.)
LUNAC. (INSANT, P. C.; LUNAC, P. C.) Since some recent acts have made alterations in the proceedings under commissions of lunacy.

An act of the 3 & 4 Wm. IV. c. 36, is entitled 'An Act to diminish the Inconveniences and Expenses of Commissions in the Nature of Writs De Lunatico Inquirendo;' and to provide for the better Care and Treatment of Idiots, Lunatics, and Persons of Unsound Mind, found such by Inquisition.'

An act of the 5 & 6 Vict. c. 84, is entitled 'An Act to alter and amend the Practice and Course of Proceeding under Commissions in the Nature of Writs De Lunatico Inquirendo. The first section empowers the Lord Chancellor to appoint two surgeons or physicians to be called 'The Commissioners in Lunacy:' and enacts that in future all Commissions in the nature of Writs De Lunatico Inquirendo shall be directed to such commissioners, and that such Commissions shall be carried on by the said surgeons or physicians, and that they shall have all the powers, duties, and authorities now had and executed by commissariers named in commissions in the nature of Writs De Lunatico Inquirendo (extant and future), and that all such commissariers (or executors) are to conduct all inquiries with respect to Lunatics and their estates in such manner as the Lord Chancellor shall from time to time direct; and it is provided that nothing in this act shall prevent the Chancellor from issuing any commission in the nature of a writ De Lunatico Inquirendo, addressed to any fit or proper person or persons, in addition to the Commissioners in Lunacy.

§ 3 empowers the Chancellor to refer to the Commissioners in Lunacy, or either of them, any of the inquiries and matters connected with the persons and estates of Lunatics which are usually referred to the Masters in Ordinary in Chancery; and § 4 makes the Commissioners in Lunacy visitors, under the direction of the Chancellor, of all persons found idiot, lunatic, or of unsound mind, by inquisition, jointly with the three visitors appointed by the 3 & 4 Wm. IV. c. 36.

§ 7 empowers the Chancellor from time to time to regulate the form and mode of proceeding before and by the said commissariers, and the practice in matters in Lunacy; and to regulate the number of jurymen to be sworn to try inquests on lunatics, and to establish the fees of such inquests; but it is provided that every inquisition on such commission shall be found by the oaths of twelve men.

By the 8 & 9 Vict. c. 100, § 3, the two commissariers of Lunacy are henceforth to be called Master and Clerk of Lunacy, and to take the same rank and precedence as the masters in ordinary of the High Court of Chancery. Some other regulations as to the duties of the masters in lunacy are contained in § 8 & 9 Vict. c. 100, § 85-96.

The other sections of the act 5 & 6 Vict. c. 84, make regulations as to fees and other matters, for which the act must be consulted. The salary of the commissariers is 2000l. a-year, free from all taxes or assessments.

The term Lunatic is only properly applied to a person who is found to be a lunatic by the verdict of a jury under an inquisition, as explained in LUNAC, P. C. But the term Lunatic is also applied to a person who has been found lunatic, and who is confined in lunatic asylums or hospitals, under such regulations as the 8 & 9 Vict. c. 100, § 49 & 49-49, prescribe, without having been found lunatic under an inquisition; and also to any single patient who is loafered or lodged for pay as a lunatic in a house not licensed under the act, § 90; and also to any person who is under the care of any person who receives or takes the charge of such one lunatic only; and derives no profit from the charge (§ 112).

As to the persons and property of such so-called lunatics, who have not been found lunatic by a jury, the 8 & 9 Vict. c. 100, § 94, enacts, That whenever the com- missariers in lunacy have reason to believe that any person is not in the property of any person detained or taken charge of as a lunatic is not duly protected, or that the income thereof is not duly applied to its maintenance, such commissariers shall make such inquiries relative thereto as they shall think fit, and

P. C. S. No. 115.
report them to the lord chancellor. § 98 enacts, That when any person shall have been received or taken charge of as a lunatic upon an order and certificate, or an order and certifica-

tate under the provisions of that act, and shall either have been in such state of insanity for the last five weeks, or shall have been the subject of a report by the commissioners in lunacy in pursuance of § 94, the lord chancellor shall direct one of the masters in lunacy to inquire and report to him as to the state of such person, so confined, and to authorize the person is authorized to make orders for the appointment of a guardian or otherwise for the protection, care, and management of such lunatic, and such guardian is to share the same powers and authorities as any other guardian of the person, whether a lunatic found such by inquisition now has, and to appoint a receiver or otherwise for the care and management of the estate of such lunatic, and such receiver is to have the same powers as a receiver of the estate of a lunatic found such by inquisition now has; and the chancellor is also empowered to make orders for the application of the income of the lunatic towards his maintenance, and the cost of the care and management of his person and estate, and also as to the investment or other application for the purpose of accumulation of the surplus; but such protection, care, and management are only to continue so long as such lunatic shall continue to be detained as a lunatic upon such order or certificate as aforesaid, and such time not exceeding six months, as the chancellor may fix; but the chancellor may in any such case, either before or after directing such inquiry, and whether the master shall have been or not, direct a commission of inquiry into the nature of a Writ De Lunatico Inquirendo to inquire, to in-

quire of the lunacy of such person.

The Twelve Tables viewed persons of unsound mind (furius) might be deprived of the management of their property on application to the praetor by his next of kin. This legisla-
tion was either introduced or established by the Twelve Tables. The person who had the care of the lunatic and of his property was called a curator. [CURATOR, P. C.] The Twelve Tables gave the care of the lunatic to his suignati. In those cases where the law had not provided for the appoint-
ment of a curator gave the praetor named one. (Dig. 27, tit. 10; Inst. 1, tit. 23.)

LUNATIC ASYLMS, COMMISSIONERS IN LUNACY, STATISTICS, CONSTRUCTION, AND MANAGEMENT OF ASYLMS. HISTORY OF THE NON-RESTRAINT SYSTEM. The subject of insanity and asylums for the insane has of late years occupied a very large share of public attention; particularly as an opini-

on has prevailed that insanity is on the increase in this king-

dom beyond the ratio of population. The want of accurate information renders this point doubtful; but it is certain that more than 20,000 insane persons are in confinement in the pauper and licensed houses in England and Wales, in whom 16,000 are paupers. But as a great number of patients are confined separately, or in the care of their relatives, of whom no public returns are made, this number is probably far below the true number insane in this country.

Two acts passed in 1845 (5 & 8 Vict. caps. 100 and 125) have placed the powers vested in the Commissioners in Lu-
cy on an entirely new footing, and have in many respects modified the constitution of asylums. The first act repealed 2 &

3 Wm. IV. c. 107; 3 & 4 Wm. IV. c. 64; 5 & 6 Wm. IV.

c. 22; 5 & 6 Vict. c. 73; 5 Vict. c. 4; and 5 & 6 Vict. c. 87.

This first act appoints six commissioners, three of whom are physicians and three barristers, with salaries; and five other commissioners who act gratuitously. The rule that none of these shall be connected with any asylum is continued. No person can act as a commissioner who within one year has been related to a patient confined in any asylum in the county in which the commissioners are appointed; and all the commissioners are required to attend to every asylum in their county at least four times per annum.

No additions to or alterations in a licensed house can be made without the consent of the commissioners. No licence is to be granted to any person who has not given the most particular information in writing to the commissioners that he has the means of maintaining and providing for a certain number of patients, and that he has a wish to renew must give the number of patients then con-

finned. The jurisdiction of the commissioners extends to the whole of England, Middlesex, and Westminster; and to all the places within seven miles of London. Westminster, Southwark: in the county the licences are to be granted by the justices of the peace in quarter-sessions, who are bound to appoint three of their number, together with one physician, surgeon, or apothecary, as visitors of the asylums licensed by them. Strict regulations are enforced for the reception of patients; it is required that every person, not being a pauper, received as insane, shall be certified to be so by two physi-

icians or surgeons, and that such patient shall be shown to have no interest in the asylum in which such patient is to be confined; and certain entries of these particulars are to be kept at each asylum. For a pauper, the certificate of one medical practitioner is sufficient. The asylum commissioners of smaller size are to be visited by a medical attendant at defined periods, according to their size. Every house within the immediate jurisdiction of the commissioners shall be visited by them at least four times in the year, and every other house at least twice in every year; these visits may be made at any hour, even by night, and it is penal to conceal any part of a house from them. Similar powers are given to the visitors in the county.

The commissioners are to present an annual report to the lord chancellor of the state of the different asylums visited by them, which Report shall be laid before parliament.

An important innovation is in the act respecting the care of single patients. Orders and medical certificates must in future be procured for the care of one patient, similar to those used for the admission of patients into licensed houses; and certificates must be signed by one medical practitioner, and copies of all such certificates must be registered by the secretary to the commissioners. This act only extends to England and Wales, and it does not affect Scotland. The power of the commissioners to hold commissions De Lunatico Inquirendo, hereby styled specially, is commissioners, are in future to be termed 'Masters in Lunacy.'

The second act, which repeals 9 Geo. IV. c. 40, relates to the regulation of lunatic asylums for counties and boroughs, and the maintenance and care of pauper lunatics; and gives to the commissioners a great power over these institutions, which had previously been entirely under the control of justices of the peace. The justices of every county and borough are now to be compelled to erect or join in the erection of an asylum, where none such already exists; and all proposals, agreements, and plans, and the rules and regulations of each asylum, are to be submitted to the commissioners, and all contracts and estimates approved by the secretary of state. Contracts for the care of insane persons in licensed houses do not exempt any county or borough from the obligation of providing an asylum. Power is given to commissioners to employ any one of the officers of asylums; and a medical officer must be resident in every asylum which contains more than 100 patients. Lists of all the patients are to be sent twice in every year to the commissioners. The commissioners may requisition works only to England and Wales, and does not apply to Bethlehem Hospi-

tal.

Great advantage may fairly be anticipated from the restrictions imposed by these acts; and the more probably considered as steps towards the highly desirable result of making all insane persons immediately the care of the State. The duties of the commissioners have, until the last few years, been very imperfectly performed, and the utmost secrecy as to their names and movements was preserved. The manage-

ment of private asylums must vary considerably, as such houses are rarely built for the purpose, and are frequently under the direction of persons uninterested in the wants of the insane, for such an important charge; but these circumstances can by no means be admitted as excuses for the scandalous instances of cruelty and mismanagement which have gone on under the former systems of management. Public asylums, where an immense number of paupers are taken at low rates; the temptation held out in such cases to economy at the expense of the care and comfort of the patients ought to call forth an especial watchfulness on the part of the commissioners.

The patients who are confined in prisons, hospitals, work-

houses, or in the houses of their relatives, are exposed perhaps to more than to go unnoticed, and not unfrequently are treated with great cruelty, even when the intentions of the parties who have charge of them are good, through their entire ignorance of the nature and proper care of the insane, or of the disorder.

Management of Public Asylums.—There is considerable diversity in the internal regulations of different public asylums as to the power and position of the medical and non-medical
In some cases there is a resident physician who holds the superintendency of the management, and in others the physician only presides in his own department; and in others the chief officer is not medical, and the physician is non-resident. The Norfolk asylum was built in a country area, and is located far from the town. It is held without a resident medical officer; and this fact is severely commented on by the commissioners in their report.

Under the new act a resident medical officer has been appointed; but we understand that the chief authority still remains with the non-medical superintendent. In the 70th Report of the visiting justices of Hanwell (April, 1844) it is stated that they have appointed an officer in the army to act as medical officer of the asylum. The commissioners in their report place a greater order and discipline than had been maintained under medical rule; in the 72nd Report (October, 1844) the resignation of the governor is mentioned, and we cannot learn from the reports that any steps have been taken to appoint a successor, nor whether the advantages derived from his appointment equalled the expectation of the justices.

In all asylums the position of the matron is one which requires to be settled in some uniform manner, and to be free from every possible source of inconvenience to the inmates. The matron having been in many cases the wife of the superintendent, an undue influence has been given to her position; the appointment of the female attendants, and even the classification of the patients, has been in too many cases influenced by her sex and personal acquaintance, or even persons of good general information, it is manifestly improper to allow her too high an authority. In the French asylums, and we believe also in some of those in the United States, the superintendents are chosen from the experienced female attendants as heads of departments, and receive the orders of the medical officers; and this arrangement, which is found to work exceedingly well at the Salpêtrière, where there are 1500 female patients, seems on the whole to be the best. The effect of placing the matron in a higher position is almost certainly to bring about interference on her part with the duties of the medical officers, which cannot be done without arising objections. The plan proposed by Mr. Hanwell the salary of the matron is higher than that of the resident medical officers, or than that of any officer excepting the physician.

In the appointment of a chaplain, steward, secretary, accountant, and any other officers, the most important point is to confine their duties within certain proper limits, and to prevent their interference with the patients without the concurrence of the medical officers. If the government should at any time take the entire superintendence of asylums for the insane into its own hands, we trust that the mode of proceeding will be to appoint to each asylum one resident medical officer, and to leave the entire conduct of the asylum; and to whom, therefore, the power of appointing and dismissing all the subordinate officers shall belong. That a system such as this which has been a great evil in many asylums, would thus be avoided.

If the government should at any time take the entire superintendence of asylums for the insane into its own hands, we trust that the mode of proceeding will be to appoint to each asylum one resident medical officer, and to leave the entire conduct of the asylum; and to whom, therefore, the power of appointing and dismissing all the subordinate officers shall belong. That a system such as this which has been a great evil in many asylums, would thus be avoided.

It is generally admitted that the building ought not to be erected in a place farther than 10 miles from the centre of the town, and the provision for proper treatment for the middle classes. It is proposed to build an asylum in the neighbourhood of London for 300 patients, at a cost of 30,000, which sum is to be raised by contributions and subscriptions. The commissioners, however, think it will be self-supporting, and it is expected that payments of from 11 to 12s. per week for each patient will cover all the expenses. No existing asylum offers to persons able only to pay such a sum the comity to which their position in society has accustomed them.

Construction.—The site and construction of an asylum for the insane are matters of great importance. A healthy and cheerful situation should be the first consideration in an institution intended for the cure of diseased minds. In this respect some existing asylums are very well placed; Hanwell, Lincoln, and Surrey may be instanced. Others have been originally on the outskirts of towns, and have been surrounded and built in by the increase of the building. The commissioners mention several so placed in proper terms of censure.

It is generally admitted that the building ought not to be erected 10 miles from the centre of the town, and the provision for proper treatment for the middle classes. It is proposed to build an asylum in the neighbourhood of London for 300 patients, at a cost of 30,000, which sum is to be raised by contributions and subscriptions. That a system such as this which has been a great evil in many asylums, would thus be avoided.

All疯病患者应被送入同一所医院，以便于集中管理。如果这些疯病患者居住在不同的医院里，就会产生混乱，并且需要大量的费用。在这种情况下，应该将这些疯病患者集中在一个地方，以便于集中管理。
the intervals of their fits the most intelligent of the patients, but during the fits they require great attention.

All the sick, idiots, and epileptics should be on the ground floor, which will be easily arranged, as the tranquil and moderately warm rooms which the great bulk of the patients may occupy the upper floor.

To describe the numerous minute particulars to be attended to in constructing and furnishing an asylum is unnecessary here; the general rule should be, that every possible amount of safety should be combined with every possible amount of cheerfulness. There should be the strength of a prison without its gloomy character. No part of the building, within or without, should be neglected; and scarcely a day passes without improvements being made in one asylum or other—improvements that are worthy of adoption in any to be hereafter built.

An abundant supply of warm and cold water should be secured; or in some cases it will be found that the cost of supplying this necessary article will neutralize the advantages of an otherwise favourable site.

Baths, water-closets, a store-room, and rooms for washing, are essential in every ward. Warm baths are considered by many authorities to be valuable remedial agents, as well as advantageous to the general bodily health.

Statistics.—There are in England and Wales 12 county asylums, 5 country and subscription, 11 partly charitable, 1 military, 1 naval, and 142 licensed houses; 14 of which last receive paupers. The hospital of Bethlem, which is exempt from the rules that affect other asylums, is not included to this number.

Scotland has eight public asylums; in all of which, we believe, private patients as well as paupers are received; and some are assisted by charitable endowments.

Ireland has twelve public asylums; ten of these are district asylums for the poor; Cork is locally governed, and Swift's Hospital is founded by charter.

Several new asylums are in progress both in England and Ireland.

With a view to present in a few plain statistical tables the results of treatment in each of the existing public asylums, the writer of this article sent blank forms to each superintendent in the kingdom; in almost every case they have been filled up and returned, and their contents are embodied in the following tables. When information could not be obtained in this manner or from reports, the statistical tables published by the Commissioners in Lunacy have been referred to; but these only extend to the end of the year 1843, and required much correction, as they are not upon one uniform plan. We may instance the tables furnished by Bethlem and St. Luke's as omitting many of the particulars desired by the Commissioners. In several asylums no average number of patients is given, and the per-centages of deaths and cures are calculated upon other numbers; in other asylums which have been opened many years, the early records are so incomplete as to be useless. In several asylums, even in some apparently good, the published returns do not contain any distinction of the sexes.

The First Table shows the whole number of patients admitted into the 49 public asylums of the United Kingdom to the latest date for which we can obtain information: being 58,537 males, 58,328 females, and 8304 of whom the sex is not specified. Thus the admissions of males exceed those of females by 209, or in the proportion of 1 to 9464; a scarcely appreciable difference. Of the whole number of insane persons in England and Wales on the 1st January, 1844, according to the report of the Commissioners, 9862 were males and 11,001 females; thus the females exceed the males in the proportion of 1 to 924. The greater mortality among men is the cause of this apparent discrepancy.

The following Table (II.) shows the result in the same asylums as to cures and deaths during the same period. This comparative table is recommended by the Commissioners, in addition to the tables showing the per-centages of cures and deaths on the average number.

The cure are taken as 1.

The term 'Removed' includes all discharged improved or cured, or escaped.

This table likewise shows the number remaining in the different public asylums at the latest dates to which we have been able to make up the returns, and which appears to be 5163 males, 5044 females, and 236 of whom the sex is not specified.

The greater number of cures and smaller number of deaths among females must be in a great measure ascribed to

* Only for 24 years; † Only for 14 years; ‡ Only for 6 years; § Sexes not distinguished.

LIVERPOOL receive only recent cases; and in the Liverpool institution their probation is very short. The large asylums at Hauwell, Surrey, and Lancaster are consequently compelled to receive almost entirely incurables, which accounts for their small number of cures. The large number cured in the Irish asylums may be in some measure accounted for by the peculiar character of their patients. The Irish patients in English asylums usually recover rapidly, the form of disorder being frequently pure excitement, which is soon allayed by quiet, by temperance, and the orderly regulations of an asylum.

Many attempts have been made to obtain a uniform system of keeping statistical tables; at present a different plan is adopted in almost every asylum. A great improvement would be effected if every report, in addition to its information for the current year, contained a condensed statement from the opening of the institution as to admissions, cures, and deaths; and there would be little difficulty in adding the ages, forms of disease, the causes of death, and other tables. Much important information as to the most favourable and unfavourable ages, and the results of immediate and delayed admission, would be easily gathered, if a reference to the last report of any asylum were sufficient to show the experience of that institution from its opening in a condensed form. No asylum has yet published any such tables; but in the numerous new asylums which will be built in the course of a few years,

* These discharged and removed include those with the cured.

† Sexes not distinguishable.

‡ Great doubt exists as to the accuracy of the older books at the York Asylum.

§ There is some mistake here; the admissions are made to amount to 1399, and the cure, deaths, and remaining patients to 1488.

nothing could be more easy than to adopt them. The legis- lature may possibly enforce certain tables; and such a law would be exceedingly desirable, if we could hope that the practical experience of the superintendents of lunatic asylums would be allowed to be of any weight: but if the returns are to be made out according to the fancy of men ignorant of the subject upon which they legislate, the present system, by which every superintendent follows his own discretion, is far preferable.

The following points seem to deserve attention in any plan for uniform registration:

I. Admissions for the current year:
   1. Form of disease.
   2. Causes of disease.
   3. Duration of disease.
   4. Age.
   5. Age when first attacked.
   7. Station or occupation.
II. Similar returns for the whole number admitted from the opening of the asylum.
III. Cures for the current year:
   1. Form of disease.
   2. Causes of disease.

3. Duration of disease.
4. Age.
5. Age when first attacked.
6. Duration of residence.
7. Per-centages upon average number of patients.

IV. Similar returns for the whole number cured.

V. Deaths for the current year:
   1. Form of mental disease.
   2. Causes of mental disease.
   3. Duration of mental disease.
   4. Age.
   5. Age when first attacked.
   6. Duration of residence.
   7. Per-centages upon average number of patients.

VI. Similar returns for the whole number who have died.

VII. Number discharged unsecured, improved, by request of friends, removed by parishes, or escaped, during the current year, distinguishing the reasons for removal, and the duration of residence.

VIII. Similar returns for the whole number removed or escaped.

IX. Patients remaining in the asylum:
   1. Form of disease.
### TABLE III.

Per-centages of Cures upon the average Number of Patients in the Public Asylums for the Insane in the United Kingdom, for ten Years, ending 1846.

2. Duration of disease.
3. Duration of residence.
4. Age of patients.
5. Number probably curable.
6. Number probably incurable.

The registers, to contain all this information, might be of very simple form, far less complicated than those at present in use in several asylums. The sexes should be distinguished in every statement.

Registers should likewise be kept of every instance of restraint, its nature and duration, and of the duration of every seclusion; also of employment and of the value of the work done. Many others might be suggested as useful in various ways, though not strictly necessary for statistical purposes.

Abolition of Personal Coercion.—No part of the treatment or insanity has of late years excited so much attention as the system adopted in several asylums of totally abolishing the use of all instruments of coercion, which has gained the name of the non-restraint system. We desire to preserve this name, as many asylums, which still continue to use all the ancient instruments of restraint, endeavor, by professing to practice the humane system, to lead the readers of their reports to suppose that there is no essential alteration made by the discontinuance of the use of those instruments.

In giving a slight sketch of the progress of this improvement in the mode of treating the insane, we shall consider it as a natural consequence of the progressiveamelioration in the management of asylums.

Until the establishment of Bethlem in 1847, we have little or no records of the provision made for the insane; we can only gather that all who were harmless, and many who were dangerous, supported a miserable existence by wandering and begging; those who could not be permitted to be at large were probably chained in prisons, or in the hands of their friends. Some mention is made of an asylum for insane monks established at Jerusalem in the sixteenth century, where all the rigours of monastic discipline were embodied in the treatment.

Even in Bethlem little attention seems to have been paid to the comfort or cure of the patient; the only consideration was the safety of the same part of the population. The patients were chiefly naked, and chained to the walls; and were exhibited for money, like wild beasts; and it is even said that the keepers were accustomed to allure to every subject most aggravating to the violent patient, that his rage might increase the amusement of the exhibition; while the propensities of the filthy were encouraged, and the voseous diet was kept without food, that they might appear as mere striking objects of wonder to the idle crowd. This shameful practice, by which it appears that an income of 400l. per annum was derived by the hospital, was abolished in 1770; but no improvement was made in any other respect in the treatment of the patients.

The benevolent and courageous Pinel was the first to attempt the restoration of the insane to a position among human beings. The scope of his exertions which were the great step of the non-restraint system, was the Bicêtre—hospital for insane men, near Paris. In this frightful prison the universal practice was to load patients with heavy chains,

</table>

The table above shows the percentage of deaths in various public asylums in England and Wales from 1836 to 1846. The data is presented in a tabular format with columns for each year and rows for each asylum. The table is labeled as Table IV.
quarrelsome and violent, and the more dangerous from his great bodily strength. From his frequent excesses, he had been discharged from the corps, and he had speedily dissipated his scanty means. Disgrace and misery so depressed him that he joined the Bicêtre, a state of society in which he found no favour in general, and fought those who would not acknowledge his rank. After a furious struggle of this sort, he was brought to the Bicêtre in a state of the greatest excitement. He had now been chained for ten years, and with greater care than the others, from his having frequently broken his chains with his hands only. Once when he broke loose, he defied all his keepers to enter his cell until they had each passed under his legs; and he compelled each of these strange containers, P. N. in, his previous visits to him, regarded him as a man of original good-nature, but under excitement incessantly kept up by cruel treatment; and he had promised speedily to submit to any condition, which promise alone had made him more calm. Now he announced to him that he should be chained no longer, and to prove that he had confidence in him, and believed him to be a man capable of better things, he called upon him to assist in releasing those others who had not reason like himself; and promised, if he conducted himself well, to take him into his own service. The change was sudden and complete. No sooner was he liberated than he took a locket, published a letter knowing with his eye every motion of P. N., and executing his orders with as much address as promptness; he spoke kindly and reasonably to the other patients, and during the rest of his life, lived in his cell, and was carried by Mr. G. to various institutions to hear without emotion (says P. N.) the name of this man, who some years after this occurrence shared with me the games of my childhood, and to whom I shall always attach the same confidence.

In the next cell were three Prussian soldiers, who had been in chains for many years, but on what account no one knew. They were in general calm and indifferent, becoming animated when conversing in their own language, which was unintelligible to others. They were allowed the only consolation of which they appeared sensible, - to live together. The preparations taken to release them alternately, and at stated times, and intentionally done, as dopes were come to in new severities; and they opposed them violently when removing their irons. When released they were not willing to leave their prison, and remained in their habitual posture. Either grief or loss of intellect had rendered them indifferent to liberty.

Near to them was seen an old priest, who was possessed with the idea that he was Christ: his appearance indicated the vanity of his belief; he was grave and solemn; his smile soft, and at the same time severe, repelling all familiarity; his hair was long, and hung on each side of his face, which was pale, intelligent, and resigned. On his being once taunted for this opinion, he replied, "I am not of this breed of men," converting the Indians: his dominant idea became changed into actual mania, and on his return to France he announced himself as the Saviour. He was taken by the police before the Archbishop of Paris, by whose orders he was confined in the Bicêtre as either impious or insane. His hands and feet were loaded with heavy chains, and during twelve years he bore with exemplary patience this martyrdom and constant sarcasms. P. N. did not attempt to reason with him, but ordered him to be unchained in silence, directing at the same time that every one should imitate the old man's reserve, and never speak to him. This order was rigorously observed, and profusely on the patient a more decided effect than either chains or a dungeon; he became humiliated by this unusual isolation, and after hesitating for a long time, gradually introduced himself to the society of the other patients. From this time his notions became more just and sensible, and in less than a year he acknowledged the absurdity of his previous possession, and was dismissed from the Bicêtre.

In the course of a few days, P. N. released fifty-three men, and at the same time, that concealment is involved in the confessions and petitions of patients from all nations and countries: workmen, merchants, soldiers, lawyers, &c. The result was beyond his hopes. Tranquillity and harmony succeeded to tumult and disorder, and the whole discipline of the asylum improved. The complaint that the officers of the asylum had been embezzling the public money was stigmatised as a libel or an idle discreditable statement. The details which were brought before the committee to exhibit the brutality and profligacy of the keepers need not be repeated; but it is gratifying to find that Mr. Higgins per-
severed, notwithstanding all the obloquy heaped upon him, until a complete change of the officers and of the system was brought about.

The next asylum of which we shall have occasion to notice the management is Bethlem, concerning which we find many particulars in the evidence given before the parliamentary committee in 1815.

The severest restraint and the most cruel neglect seem to have been the almost uniform practice; and it must not be forgotten that this royal hospital, favoured with exemption from all visitation and from the effects of acts of parliament, has, been, until a very recent period, the most determined in resistance of restraint, of conserving, each patient, the indulgence of his abuse, and in closing its doors against inspection. With such large funds at command, Bethlem ought to be a model where the student of medicine may see every late improvement in the treatment of mental disorder carried into effect, without regard to the economy which has been detrimental to the improvement of many other asylums.

In 1816 Bethlem appeared to have been going back, rather than improving, for half a century. From the time that the indiscriminate visits of the public had been prohibited, the secrets of the institution were known only to a few. The case of Norris, a patient in Bethlem, which was made public by the parliamentary committee, has since been related; but it will not be out of place here. William Norris had been an officer in the navy, and was first confined at Bethlem in 1801. In 1803 he is said to have struck Mr. Haslam, the attendant, and was then dragged from him or received a new and most ingenious instrument of torture was invented for his confinement. 'A stout iron ring was riveted round his neck, from which a short chain passed to a ring attached to a bar or a chain on an upper massive iron bar, more than six feet high, inserted into the wall. Bound round his body a strong iron bar, about two inches wide, was riveted; on each side the bar was a circular projection, which was fashioned to and including each of the arms, pinned them close to his sides. The waist bar was secured by two similar bars, which, passing over his shoulders, were riveted to the waist bar both at the front and behind. The iron ring was connected to his shoulders by a double link. From each of those bars another chain passed to the ring on the upright iron bar. His right leg was chained to the trough, in which he had remained thus enclosed and enchained twelve years. He read books of all kinds, and reasoned quite coherently on the events of the war.' During the whole of this period it was impossible for him, from the nature of the restraint in which he was placed, either to stand quite upright or to lie down at ease. It will be no matter of surprise that he died on the 20th of February, 1815.

From this time a gradual but very slow improvement in the condition of patients may be observed. Chains were removed, and leathern restraints of much milder kind substituted; and more care was given to the warming and clothing of the patients. Some of the largest asylums in England were opened about this period. In 1832, the production of employment by Sir William Ellis at Wakefield, and afterwards at Hanwell, was a great advance in the amount of confidence reposed in patients; employment has since been introduced in almost every asylum, and has so far reduced the cost of the hospital, and so far reduced the cost of the hospital, that there is the charge of using the coercion of fear and of the hands for that of straps and chains. A form of coercion called 'manual detention,' wherein the attendants held violent patients quiet, was used at this time, and was employed at Hanwell. It is not known which asylum where restraint is abolished.

The experience of the Lincoln Asylum has proved every advantage arising from the non-restraint system, notwithstanding the management of the managers have been selected from some of the medical officers, by whom every kind of unfair evidence was brought forward against the system, and the crueles practised by uninstructed patients were considered as part of it.

The next asylum in which restraint was abolished was that of the county of Middlesex at Hanwell. At the time of the appointment of Dr. Conolly to the superintendence of the Asylums (June, 1836) it is stated that about eighty patients; of these about twenty were almost constantly in restraint-chairs, and a number of others were restrained, muffs, &c. In addition to these restraints, which were supposed necessary for the safety of the rest and of the officers and attendants, more than a hundred epileptic patients were fastened by one wrist in bed every night. This was considered a necessary precaution to prevent the patients from falling out of bed or turning their faces in bed, and so becoming smothered, which, it is asserted, has sometimes happened. No such case has however occurred since the disuse of the hand-slap, which took place in July, 1833.

We extract the following account of Dr. Conolly's remarks (October, 1839) from the discontinuance of restraint at Hanwell:

"The article of treatment in which the resident physician..."
has thought it expedient to depart the most widely from the previous practice of the asylum has been that which relates to the personal coercion or forcible restraint of the refractory patients. Without any intention of derogating from the high character acquired by the asylum, it appeared to him that the advantages resulting from the method of reform and systematic treatment, and customary in it at the period of his appointment was in no respect proportionable to the frequency of its application; that the objections to the restraint actually employed were very much stronger, that it could not be avoided, that it was a source of much outrages and disorders, to repress which its application was commonly deemed indispensable, and consequently directly opposed to the chief design of all treatment, the cure of the disease.\footnote{By a list of restraints appended to this report, it will be seen that the daily number in restraint was in July so reduced that there were sometimes only four, and never more than fourteen, in restraint at one time; but that since the middle of August there has not been one patient in restraint on the female side of the house, and since the 21st of September not one on either side.\footnote{The 51st report of the visiting justices, which accompanies this report, speaks of the new system as requiring an additional number of attendants, and of a superior class to those previously employed.} Among all the official reports, the visiting justices report the satisfactory results of the new system.\footnote{In the 53rd (April, 1840) they report that 'there has not been a single occurrence to weaken their confidence in the practicability of the system or the improvement of destruction of clothing or other property is occasioned by the personal freedom which the patients enjoy. Indeed, so far as clothing is concerned, the amount of destruction is somewhat lessened, because of the general tranquility of the patients from the adoption of the new system.'} In the 54th (July, 1840) and 55th (October, 1840) the justices state their increased confidence in the non-restraint system. This last report is accompanied by the second report of Dr. Conolly. During the past year a suicide (by hanging) had taken place, being the only one at Hanwell since the non-restraint system had been introduced. That restraint would not have been very available is proved by the occurrence of the suicide of a female patient in Bethlem, who hung herself in 1840 by the strings of the waistcoat in which she had been confined; and a man has since destroyed his own liberty and life, also at Bethlem, by working the waistcoat in which he was strapped down in bed so as to produce apoplexy by the pressure of a knot on the neck. The last report of the Lincoln Asylum states that not only have suicides ceased since the system of non-restraint was introduced, but that the tendency to suicide has disappeared. The latest report of Bethlem also contains an admission that restraints increase the tendency to suicide.\footnote{Dr. Conolly's report treats entirely of the management of the patients without restraint, and the substitutes for it. The marked improvement in the condition of the patients is due to improved treatment of clothing, and the substitutes for restraint are, I might say, the supporters of the old system 'solitary confinement,' which term is also improperly applied by the commissioners in their report. That solitary confinement for days and weeks together was the practice in the days of restraint is certain; for then it was a common practice to strip a patient in bed or in a restraint-chamber placed in his bed-room, and no provision for escape so great as this can scarcely now take place. Dr. Conolly says, 'All the substitutes for restraint are, like restraint itself, liable to be abused; but none can be made such instruments of cruelty by the hands of an inhuman administrator, or so capable of producing mischief, were it not for the omission of the enormity of the act, and the injustice of the proceeding. However, the statute law and the medical practice act upon the�uses in the refractory wards of a lunatic asylum.' In the sixth report (October, 1844) likewise, Dr. Conolly writes that 'It is to be regretted that in one of the institutions of observation that such a simple exclusion of irritations from an irritable mind, an exclusion not found to be necessary in more than four or five instances in any one day in the year among one thousand patients, and seldom prolonged beyond four or five hours in any of those instances, during which time the patient's state is frequently ascertainment by means of the in-}

spection-plate in the door of his room, and all his reasonable wants and wishes are attended to—should ever have been confounded with the idea of Solitary Confineinent; the latter in reality comprehending a privation of all the stimuli upon which the integrity of intellectual and physical life depends.'

The room should not be dark; the shutter which guards the window should therefore be perforated. Care should always be taken that the perforations of the shutters should not be so small as to be always entirely detached. Staff should not use,
by far the greater number of asylums which have not yet given in their adherence to non-restraint as a principle, the use of restraint forms an exception to the rule. At Dundee, no restraint has been used for two years past, and this asylum was one of those most strongly against the principle of the new system, when first introduced. The reports of Nottingham, Dorset, Montrose, Edinburgh, and Dumfries speak of the advantages of the new system and the entire relief obtain from availing themselves of it. On the contrary, the authorities of Bethlem, St. Luke's, Kent, Oxford, and the Retreat at York, profess the non-restraint system, while they practise the reverse.

The possibility and advantage of the abolition of restraint would seem sufficiently proved by the results reported in all these asylums; but a large number of persons still remain opposed to the new system, from various motives. First we must mention the unfair manner in which the subject has been noticed by the Commissioners in Lunacy; a body which had been so long paid to attend to the condition of the insane, and yet who had been proved to allow every evil to remain in the hospitals under whose care, when all others were improving, should have been the last to despise the efforts of others. Their examples of the disadvantages of non-restraint are chiefly adduced from Hanwell, and are most ably urged in a pamphlet by Mr. Serjeant Adams. Many of the cases brought forward by them as proving the necessity for restraint, are in fact strong arguments on the other side of the question. Many of the Commissioners have been most

selected, until lately, exclusively from persons ignorant of insanity, must be their excuse. The absurdities which they have allowed themselves to believe and to record, would alone suffice to prove that they have been willfully mystified by some of the medical officers of asylums.

In the Bedford, Chester, Cornwall, Exeter, Leicester, Liverpool, St. Luke's, York, and Pembroke asylums, coercion still appears to remain in force. The private asylums employ it almost without exception; these, being most immediately under the superintendence of the Commissioners, are in every respect the last to improve.

The reports of the Surrey, Wakefield, and Belfast asylums have been the most consistent opponents, both in principle and practice of the non-restraint system; one assertion in the last report of the Belfast Asylum (31st March, 1845) deserves to be quoted.

After saying that  'the same system with reference to restraint continues to be pursued in this institution,' it goes on to observe, until insanity be blotted out from the 'ills which flesh is heir to,' or altogether changed in its more striking effects, physical restraint in some form or other—but still restraint—cannot be dispensed with. Truly the so-called 'total abolition' of restraint appears to be only one of the many extraordinary and aggrandizing phrases of the present day.' It may be that there is more difficulty in the management of Irish patients without restraint than English ones; although many of the other asylums in Ireland are, upon the whole, in a better state of things; but this persistent with well-known facts, proves the writer to be ignorant of the proceedings of other asylums for nearly seven years past. Taking this into consideration, we may look with some slight upon the very curious cases subjoined, where patients request the strait-waistcoat and the muffs as favours, and promise to behave well if they are allowed the indulgence; more especially as such cases do not appear ever to be met with in asylums where restraint is entirely abolished. The absurdity of such an idea as that of a patient wishing to be put in restraint, is so monstrous as scarcely to deserve notice. As regards the negro slaves I do not believe that negro slaves are in the habit of requesting the luxury of a flaunting neck-cloth, in order to gratify their gossers to allow them the agreeable exercise of the tread-mill.

With the results before us of the treatment of many thousands of the insane by means of restraint, it is quite clear that the facts, which declared most asylums where the new system has been introduced it has been found necessary to abandon it, that the reports of all these asylums declare their general condition to be far worse since the cases are not decreased, and, which we consider of equal importance, that in the comfort of the patients curables is greatly increased, we consider ourselves justified in considering that the strait-waistcoat, the coercion-chair, and the other instruments of restraint, will shortly disappear like the 'dark house and a whip,' the straw, the starvation, the whirling-chair, and every other means of torture formerly considered a necessary part of the treatment of those who were afflicted with insanity.

('Report of the Metropolitan Commissioners in Lunacy to the Lord Chancellor,' 1844; 'Statistical Tables prepared by the Metropolitan Commissioners in Lunacy,' 1844; 'An Act for the Better Provision of Lunatic Asylums in England, Scotland, and Ireland,' (8 & 9 Vict. c. 100); 'An Act to amend the laws for the Provision and Regulation of Lunatic Asylums for Counties and Boroughs, and for the maintenance and care of Pauper Lunatics,' (8 & 9 Vict. c. 95); 'Report of the Inspectors-General of District, Local, and Private Lunatic Asylums in Ireland,' 1845; 'Returns from each District Lunatic Asylum in Ireland,' 1845; 'Reports of all the principal Asylums in England, Scotland, and Ireland, and information privately supplied by many of the subscribers; Farr 'On the Statistics of English Lunatic Asylums'; Benevolent Asylum for the Insane of the Middle Classes, Prospectus of the Asylum, and the 'Description of the Retreat near York'; Hill 'On the Management of Private Lunatic Asylums'; Browne's 'Lectures delivered before the Managers of the Montrose Lunatic Asylum'; Remarks by Mr. Serjeant Adams on the Report of the Metropolitan Commissioners in Lunacy; Personal knowledge of the Mid—sex Lunatic Asylum, Hanwell.)

The custody of the insane in Scotland is, like every other matter which demands both magisterial and executive intervention, connected with the system of local courts. The law on the subject is contained in three statutes: 56 Geo. III. c. 69; 9 Geo. IV. c. 34; and 4 & 5 Vict. c. 60. By these acts in no case can the court, without the consent of the person, or private asylum, without a warrant from the sheriff. Any person accessory to a breach of this regulation is liable to a penalty of 200l; and if he be the keeper of the asylum he is liable, besides, to the penal sanctions as defined. Yet in many cases exceeding three months' duration. The sheriff is not empowered to grant a warrant unless on the report of a qualified physician or surgeon; and the person granting such a certificate is liable to a penalty of 50l, if he has connived at an illegal report to the sheriff. The sheriff, certified by two medical men, of the state of the patient, and must notify the death or removal of the patient. In every licensed asylum a 'mental-house register' must be kept. By the act of 4 & 5 Vict. this register is appointed to be annually transmitted to the sheriff, sealed up, and the seals being broken by him, he reseals the book, and retransmits it. When a patient dies in a licensed asylum, a report must be made to the sheriff within twenty-one days by a certificate from the medical attendant, stating the nature of the disease, the length of time during which it has continued, the time when his attendance was first required, and the care of the patient and evidence of his being in the asylum open to the inspection of the sheriff. In the general case, neither the sheriff or his substitute may perform the duties of the office regarding lunatics; but it is specially provided that the sheriff is to perform all the duties as to lunatics, so far as he may be within his jurisdiction, and either he or his substitute must make a second; in these visits they are accompanied by medical inspectors. The medical bodies in Edinburgh and Glasgow elect inspectors for their respective districts; in other parts of Scotland they are chosen by the sheriffs from the qualified medical practitioners.

It is believed that the system of the management of the insane in Scotland has, both in a purely medical and in an administrative point of view, been lately vastly improved. Until a comparatively late period the statute law was nearly inoperative, from a strong natural prejudice against the enforcement of general rules. The reluctance to the treatment of the insane, and the consequent toleration for breaches of the statutory regulations. The general rule adopted in practice was, that insane persons were allowed to go at large until they had proved themselves dangerous to the lives of their neighbours, and that when confinement was in any case resorted to, the proceedings were not very rigidly investigated. It is believed that the law is now generally obeyed, and that the utility of the measure of the comfort of the patients, is felt by all who are connected with them or concerned in the administration of the law. The Commissioners in 1844 reported on the state of the poor in Scotland, did not attribute all to the reasons and which we call a slow system, by exposing the state of some private asylums in the isle of Arran where insane patients were confined in violation of the rules of the statutes.
LUTZELBURGER, or LEUTZELBURGER, Hans, called also Hans Franck, an early Swiss wood-engraver of Basel, about whom very much has been written, but as yet very little is known. He lived in the early part of the sixteenth century, and is supposed by some to have cut the blocks of the celebrated "Recueil des images de la vie de l'Enfant Jesus" of Bousquet, by Hans Holbein. This supposition, however, is founded solely on the facts of his being contemporary with Holbein and the circumstance of one of the cuts being marked H. L. This is maintained by Dr. Bell and is supported by others, especially by Kunroth in 1856, in a work entitled "Hans Holbein der Jüngere in seinem Verhältniss zum Deutschen Formenschnittwerk." (Hans Holbein the younger, in his relation to German wood-engraving.) There are many other celebrated old cuts, singly and in sets, some from drawings by Holbein, which are attributed to Leutzeler, and which are described at length in the "Künstlzeit," and in the works of Bartsch, Heisser, Mastmann, and other writers on wood-engraving. The views of all parties are stated with considerable detail in Dr. Nagler's "Neues Allgemeines Künstler-Lexicon." 

LYCIA, a genus of plants belonging to the natural order Juncaceae. It has a 1-celled 3-valved capsule, without dissepiments, with three seeds at the base of the cell. Several species of this genus have been described. L. salicifolium, the salix-leaved woodrush which grows in shady places, is one of the Great British species. L. caespitosum is common in the pastures of this country, and seven species are natives of the British Islands.

LYCHNIS (from λυχνη, a lamp), a genus of plants belonging to the order Caryophyllaceae. It has been divided into four suborders, the suborder Silene. It has a 5-toothed naked calyx; 5 petals, clawed; 10 stamens; 5 styles; the capsules 1-celled, or half 5-celled, opening at the top with five or ten teeth. The species are smooth, hairy, or coarsely hairy, with terminal corollas of flowers, rarely solitary.

L. chelidonium, the Scarlet Lychins, is a smooth clanny plant, with corolla-like flowers in bundles; the calyx cylindrical, clawed, winged; the calyx 2-, lobed, the corolla long; the leaves lanceolate, slightly cordinate at the base, and clasping the stem. This plant, which produces scarlet, roselike flowers, and white flowers, and is a great favourite in our gardens, is a native of Siberia and Japan.

Several varieties of this plant have been named. L. grandiflora is a glorious plant, the flowers solitary or terminal, terminal and axillary; the calyx terete, clavate, ribbed; the petals lacerated; corolla elongated; the leaves ovate, almost sessile. It has large beautiful scarlet flowers, and is a native of China and Japan.

L. Flous Coccii, Raggled Robin, has deeply 4-cleft petals, with a very short corolla. It has rose-coloured petals, and is an abundant plant in the moist meadows and pastures of Great Britain, as well as the whole of Europe.

L. visnaga, the Corn cockle, has the petals half-bifid, and the calyx teeth of the fertile flowers linear lanceolate, elongated; the capsule conical; the teeth erect. It is a common plant in the hedge-banks of Europe. This and the saline insipid species are frequently regarded as varieties, and then named L. dioica.

L. diurna, Red Campion, has the petals half-bifid, the calyx teeth of the fertile flower triangular, the capsule nearly globose, the teeth reflexed.

The other British species of the genus Lychins are: L. Gilia, the Corn coke, a pretty plant blossoming in cornfields from June to September; L. alpina, found on the mountains of Fortunaria; and L. Virginica, a rare plant.

Many of the foreign species are cultivated in our gardens. They thrive well in a light rich loamy soil, and may be propagated by cuttings of seeds.

LYCIA. In addition to the general description of the country in the P. C., and the geographical description of the arid table land in the "Atlas," and the "Census of the Empire" (pp. 112), we give a few particulars respecting the inhabitants and natural productions of this most interesting portion of Asia Minor.

This country is, as it seems, well inhabited, chiefly by Turks, many of whom lead a life half settled and half nomadic; they are distinguished above all other inhabitants of Asia Minor by their excellent character. Most of them are farmers, and the principal products are olive oil; grain; and cotton. Berberis Armeniaca and Greeks who live in the sea towns, form the greater portion of the population of the inland town of
Almali, which is the largest in Lycia, the population being about 25,000. Those among the Turks who wander with their herds on the high plateaus, like the Turcomans, show an independence of manners and character not very pleasant to Europeans. In the seventeenth century such a nation appears to have been a good sort of people. The Turkish population is exceedingly careless about money, and when they have enough to eat and to drink,—and they are moderate in their habits,—they are satisfied and care for nothing more. They are somewhat shy in receiving a stranger, through fear of being treated as they are by Turkish officers and the Sultan's couriers, who take away everything they please without ever paying for it. Along the coast of Lycia as well as the adjoining provinces of Caria and Pamphylia, there lives a number of Arabs, (Syrians) who are generally seamen, and seem to have settled there many centuries ago. Among the wild animals, the 'kapan,' (which term is here applied to the leopard), and the 'arslan' or lion (perhaps the panther), commit great depredations among the herds; great numbers of them are annually killed, and a reward of from 100 to 200 pisters is given by the government for each 'arslan.' They are very frequent in the district of Sidyma, on the coast. The ox is precisely the same as represented on the ancient coins and monuments of Lycia; but there is also a species of dwarf ox, of the size of a large sheep, there are great numbers of buffaloes and camels. The breeding of horses is carried on to a great extent, and herds of many hundreds are often seen grazing together in the valleys. The only kind is that of the Arabian breed, the best seen in the ancient marbles; the head is of Arabic cast, the chest is very large, the feet are remarkably fine and thin, and the ears are small, as in the antique. They are not shod. The rivers and lakes of Lycia are not frequented. 'At such a time,' the tide swarms with the green climbing frog. No part of Asia Minor contains such splendid valleys as those of the Xanthus and the Donolomen Chai: Mythre, oleander, and pomegranates cover the banks of the rivers; the plain along the river is well cultivated, and in many places the fields are enclosed by fences of myrtle and the small prickly oak, mixed with the orange, the wild olive, the pomegranate, the oleander, the elegant grape-vine, which are most beautifully matted together by vine, clematis, and many other climbers. Fruit trees are planted in enclosures. The hills are covered with large oaks and pines, which supply excellent timber, of which, however, only small quantities are shipped from the coast towns. The oak, 'quecus regios,' is a source of wealth from its acorns, the 'velans' of the Smyrna merchants, which is used in tanning leather and gives it that agreeable smell which places the Turkish leather even above the Russian 'Jacht.' A sort of horse-radiush is used as food, and as a substitute for soap. In proportion as the traveller approaches the high upland plains, the tender fruit-trees, as well as the olive, the aloe, and the myrtle, are displaced by the walnut, plum, apple, and pear trees. The high plain round Almali, which is 4000 feet above the sea, is one of the largest and best cultivated corn tracts in Asia Minor; its chief productions are wheat, corn, and grapes. Olive vines are chiefly raised in the valleys and on the coast. (Fellows, An Account of Discoveries in Lycia; A Journal written during an Excursion in Asia Minor.)

LYCOPERSICON. [Solanum, P. C.]

LYCORTAS. [Phylloxyx, P. C.; Polythys, P. C.]

LYGODYSDEEA C. E. C. D. A natural order of plants closely allied to Conchinesace. It differs from this order in possessing an ovary composed of two coniform carpels, 1-celled, with two ovules, and a single style; the pericarp brittle burst in four directions from the base, not adhering to the seeds, 1-celled; two free placenta rising up between the pericarp and the back of the seeds; two seeds pendulous from the apex of the placenta, with the embryo straight, felicitous, compressed; the radicle short, inferior. The species are twining shrubs, and have simple stipules between the petals.

This little order was constituted by Bartling, but was afterwards condemned by De Candolle, who thought there was no reason for separating it from Conchinesee. 'According to De Candolle, what Bartling calls pericarp is calyx, and his sectile monadnths are to be regarded as the most remarkable features of the order disappear, with the exception of the absence of the albumen.' (Linley,) This is a subject that merits further investigation. The only genus of this order is Lygodysdea, L. c. c. 'Two species have been described. They are both natives of Peru and Mexico.'

LYLY, LILLY, or LILLY, JOHN, was a native of the Weald of Kent. His birth has been referred to the year 1554, on the faith of the entry of his matriculation as a student at Oxford in 1571, which asserts him to have been then seventeen years old. As a lover of arts in 1572. It appears from one of his prefaces that he was rusticated from Oxford; and, after having (it is said) studied likewise at Cambridge, he went to London, and spent his life in literature, as a dramatic and miscellaneous writer. Although his writings must for a considerable time have been fashionable at court, he appears to have shared to the full in the poverty and distresses of authorship. He is supposed to have served Lord Oxford, but nothing has been ascribed of his place; and he was long and unsuccessfully an applicant for the office of master of the revels. In one of his petitions to the queen, which has been preserved, he, with melancholy quiescence, describes the history of his life as 'Lyly De Tributibus,' wherein he shall be seen patience, labours, and misfortunes.' The time of his death is unknown; but he must have survived the beginning of the seventeenth century.

The two most famous of his works bore the following titles: 'Eupheses: the Anatomy of Wit, very pleasant for all gentlemen to read, and most necessary to remember: wherein are contained the delightgs that Wit followeth in his youth by the pleasantness of love, and the advantage in his age by the perfection of Wisdome,' 4to, 1579 or 1580: 'Euphes and his England; containing his voyage and adventures, mixed with sundrie preie discourses of honest Love, as the description of a voyage on the sea of that Isle; delightful to be read, and nothing hurtful to be regarded; wherein there is small offence by lightness given to the wise, and least occasion of loosenesse professed to the ignorant.' A second edition was reprinted against Martin Marprelate: 'Pap with a Hatchet; alias, a Fig for my Godson; or Crack me this Nut; or a Country Cuff; that is, a sound Box on the Ear for the Idol Martin to hold his peace: written by one that dares call a Dog a Dog.' 1593. He was also the author of nine plays still extant: 1. 'Alexander and Campaspe,' 1584, 1591; reprinted in Dodsley's Collection, vol. ii. 2. 'Sapho and Phoe,' 1584, 1591. 3. 'Cymon and Helen,' 1580, 4to; reprinted in Jolly's Collection, vol. ii. 4. 'Galateas,' 1602. 5. 'Midas,' 1629; and 6. 'Mother Bombie,' 1564, 1567; both reprinted in Dodsley's Collection, vol. i. 7. 'The Woman in the Moon,' 1597. 8. 'The Maid's Metamorphosis,' anonymous, but generally attributed to Lyly, 1600. 9. 'Love's Metamorphosis,' 1601; the authorship of which has been doubted.

The first mentioned work of Lyly gave the name of 'Euphues' to a fashionable style of language, of which, although he certainly did not invent it, he was the most eminent literary cultivator. The Euipheus of Lyly himself was just an exaggerated form of that strained, pedantic, over-conscious style elaborated by his predecessors and exemplified by the style in general, as well as in literature about the middle of Elizabeth's reign. In his hands it added to the classical pedantry of the day a pedantry of something like science, consisting in incessant images derived from the study of half-faithful and antiquated sources. Drayton, in ascribing to Sir Philip Sidney (himself no very simple writer) the merit of having brought back the tone of language to nature, speaks of Lyly as 'Talking of stucous, sten, stations, of false, film, Playing with words and idle similies. Shakespear's Don Armado has sometimes been considered as 'parleying Euphuism,' but, as Mr. Knight has observed, 'there is a nearer approach to this jargon in much of the language used by the higher personages in the same play. The absurdities of it are buried by Jonson in his 'Cynthia's Revels.' Sir Pierce Shafton, in 'The Monastery,' is an unsuccessful attempt at reproducing the characteristics of Euphuism. Lyly's diction are almost everywhere deformed by the same false taste; yet they exhibit occasional touches of fine fancy, which however is shown to greater advantage in some of the short lyrical pieces in his 'Euphuism.' The wit of the dialogue is in some places lively. To success in portraiture of character these plays may make no claim; and as little can their mythological, pastoral, or classical tinctures be said to have been cultivated with dramatic skill. The author's claim to remembrance as a dramatist rests almost wholly on his position as one of Shakspeare's immediate predecessors; and on the fact that his plays present, in the minor characters, the antecedents of the literary tastes which prevailed in that interesting age. LYON KING AT ARMS. [Herald, P. C.]
LYSIMACHIA, a genus of plants belonging to the natural order Primulaceae. It has a 5-petalled calyx, a rotate corolla with scarcely any tube, and a 5-parted limb. The stamens are inserted at the base of the corolla, and are 5 in number. The capsules open with 5 valves.

L. thysiflora is distinguished by its axillary stalked dense racemes; the flowers are opposite and lanceolate. The corolla is divided almost to the base into narrow petals often separated by a minute tooth, which as well as the calyx is yellow spotted with orange. It is found in marshes in the north of England.

L. vulgaris has an erect stem, with compound terminal and axillary panicles, ovate or ovate-lanceolate leaves nearly sessile or 3 or 4 in a whorl. The petals are entire with glabrous toothed margins and about half their length. This species is the L. punctata of some botanists, and probably the Lonicera  in Dioecious, lib. iv. cap. 3. (F. and J. R. Synnott Plantarum Flora Classice; Babington, Manual of British Botany.)

LYTHRUM (from the Greek, 'black blood,' from the purple-coloured flowers), a genus of plants belonging to the natural order Lythraceae. It has a tubular cylindrical calyx, with from 8 to 12 teeth; from 4 to 6 of the teeth are broader than the rest and erect, the alternate ones being subulate and opposite to the petals. It has a dark and a very short style. The capsules are 2-celled and many-seeded.

L. Salicaria, Purple Loosestrife, has lanceolate leaves from a cordate base and whorled. The flowers are in whorled leafy spikes, almost sessile. It is a native of Europe, in ditches and watery places, especially about the margins of ponds and rivers, and is found in Britain very plentifully. The colour of the flowers varies from crimson to purple. The herbage is generally almost smooth, and of any green, but in dry situations it becomes hairy and downy, or in some degree hairy, as well as more dryly in stature. This species is the Lythrum salicaria, lib. xxvi. cap. 12, 4.

L. hyssopifolia has alternate lanceolate blunt leaves. The flowers are axillary and solitary, with two minute subulate bracts. The calyx teeth are all short, and the stamens are usually six in number. The flowers are small and of a light purple colour. The whole plant is glabrous, and is found in damp places in Great Britain.

L. Flavescens, Hunter's Purple Loosestrife, is a native of the East Indies. The leaves are opposite, the calyx tubular and 6-lobed, the stamens 12, and the style subulate. The petals, 6 in number, are of a very beautiful red colour, and are used for dyeing in India. The hardy perennial species of Lythrum are handsome garden-flowers; they are of many common soil, and are easily propagated by dividing at the root. The seeds of the annual kinds require to be sown in moist situations in the spring.

(Don's Gardener's Dictionary; Babington, Manual of British Botany.)

M.

MCRIE, THOMAS, a writer on ecclesiastical history and polemics, was born at Dunse in Berwickshire, in November, 1772. His father was a petty manufacturer and trader, who had by his industry and economy been enabled to maintain and educate, and send his only wage in quondam, a degree of independence. Dr. McCrie's parents, says his biographer, being connected with that branch of the secession usually termed Anti-Burghers, he was brought up under the ministry of the elder Mr. McTaggart, at a period when the strictness of that communion was retained in a measure which is now wholly unknown. In these circumstances he received that thoroughly religious education, of the importance of which he was ever afterwards so strenuously an advocate, and of the success of which he was himself a striking example. Having received the rudiments of education at the parish school of his native place, he afterwards studied at the University of Edinburgh, which he entered in 1788. Contemporaneously with his academical studies, he occupied himself in teaching younger lads, an employment for which he seems to have been well qualified. In 1791 he commenced his peculiarly theological studies. In 1795 he was licensed as a clergyman by the associate presbytery of Kelso, and he was immediately afterwards chosen pastor of a congregation of the same body in Edinburgh. In the earlier period of his ministry he entered warmly into those discussions naturally prevalent among bodies who have so many points of repugnation from each other as the small Presbyterian sects which had sprung from the church of Scotland. He soon commenced however the important task of studying, for the purpose of some undefined literary projects, the early history of the Presbyterian church in its connection with its most remarkable champions. The body to which he belonged followed a rule of Presbyterian discipline, from the strict tenor of which they maintained that the established church had diverged; and, recurrently perpetually to the conduct of the fathers of Presbyterianism, it was likely that any member of this body with sufficient talent would be the most zealous biographer of these primitive worthies. In 1812 he published 'The Life of John Knox.' Scholarship or literary ability were qualities which the clergy of his sect, consisting almost entirely of the humblest members of society, were never expected to display; and this first attempt, which showed both qualities in an eminent degree, accompanied by much patient research, was looked on as a literary phenomenon. In 1813 he received the degree of D.D. from the university of Edinburgh, previous to the appearance of the second edition of his work. It has since passed through several editions, and, with rapid sale, has taken its place in the literature of Scotland, and is highly esteemed by historical students. In 1819 he published a work of still more extensive and curious research, 'The Life of Andrew Melville,' a celebrated champion of Presbyterianism in the reign of James VI; and it is the indefatigable minuteness of the researches connected with this volume is scarcely matched in the English language, and it had the effect of reanimating from the most obscure materials—records of births, marriages, and deaths, ecclesiastical and proprietary registers, and like sources—the circumstances connected with the lives of some interesting men who in the stir and bustle of their own active age had failed to find commemorators. The partisan zeal with which those works were undertaken is not their least remarkable feature, and obtained from Mr. Hallam the apt designation of 'Presbyterian Histodebriatn.' There is no doubt of the accuracy with which Dr. McCrie stated facts and cited authorities, and that he was thoroughly honest; but from the beginning to the end each work is a piece of industrious and acute special pleading, and the reader whose position enables him to take an impartial view of the subject in question, will find it necessary that he knows what portions may be favourably dwelt on, and what should be hastily passed over, if not omitted. His palliations and vindications are singularly ingenious; and amid all the rude matter, the writer himself shows clearly that he knows how to give the history, he vindicates his own heroes from all follies as well as from all vices; even the destruction of the Scottish ecclesiastical buildings has its meed of praise. Written in a style admirably adapted to its subject, and by men in pursuit of it, they are very popular with the ultra-Presbyterian party in Scotland. Their author led a blameless simple life, on a small salary, which, with the free use of the valuable public libraries in Edinburgh, contented his unremunerative disposition. He died on the 6th August, 1836, deeply lamented by the members of his congregation and a wide circle of private friends.

(Life of Thomas McCrie, D.D., by his son, the Rev. Thomas McCrie.)

MCULLOCH, DA. JOHN, was born in Guernsey, on the 6th of October, 1773. He was descended from an ancient Scottish family, the MacCullochs of Nether Ardwall, in Kirkcudbrightshire, a younger branch of the MacCullochs of Myretoun, a family which at one time possessed considerable property in Galloway. He was the third son of James MacCulloch, Esq., and Elizabeth, daughter of Thomas De Lisle, Esq., one of the jurats of the royal court of Guernsey. In his childhood Dr. MacCulloch was very thoughtful, and fond of being alone. He taught himself to write, and wrote Latin exercises at an age when many children have barely acquired a knowledge of the alphabet. He seldom played with other children, but when the hours of study were over was in the habit of going into a room which his father, who was a man of scientific and literary attainments and a good mechanic, allowed him to call his own, and the door of which he contrived to fasten with a large bent needle in such a manner as to prevent his brothers entering. Here he amused himself with drawing, carving various articles in wood and cocoa-nut shell, and, at a very early age, in attempts to make gunpowder, and, after he had effected that, in manufactominig fire-works. His family was at this time residing in Cornwall, and the first school he was sent to was the grammar-school at Plympton. He was afterwards removed to one at Penzance; and thence, in 1787, to the grammar-school at Lostwithiel, where he remained three years, and where his talents seem to have been appreciated by the master, Mr. McGilvery, of whom Dr. MacCulloch always spoke with the greatest respect and love.

In 1790 he went to prosecute his medical studies at Edinburgh, where he obtained his diploma of physician, at the age of eighteen. He subsequently entered the artillery as assistant-surgeon, and on the 6th of April, 1802, accepted the situation of chemist to the Board of Ordinance. In 1807 he resided at Blackheath, where he practised as a physician. His application while pursuing his studies at Edinburgh was intense, and probably received an additional stimulus from the circumstance that his father, who was settled as a merchant in Bretagne, was arrested at the beginning of the French revolution, and it is this that caused the idea of the history of the Reign of Terror, a state of things which naturally put a stop to the lucrative business in which he was at that time embarked. During Dr. MacCulloch's occasional visits to Penzance, while he was in the same business, he went to the Boscobel, retired, and became acquainted with Sir Humphry Davy, who was indebted to him for some of his earliest instruction in chemistry.

About the year 1811 he was engaged by government to make various surveys in Scotland. He in consequence gave up his practice, which he never regularly resumed, although he was frequently consulted. The first business on which he was employed in Scotland, was in a search for stones adapted to the use of the government powder-mills. The second was an examination of the principal mountains, with a view to the repetition of the experiments which had been made at Edinburgh on the density of the earth. The third had for its object the correction of the deviations of the plumb-line on the meridian of the trigonometrical survey. Whilst he was making these surveys, he also employed himself in geological researches, and in furnishing materials on the manufacture of the new public work in which he was employed - the mineralogical and geological survey of Scotland, which was continued every summer from 1829 to 1832, when he completed it. The winters of these years were spent in literary and scientific work, putting in order the observations made in the summer, in
drawing sections, and preparing the map. This great work, precise and exact as it is, the labour of one individual, begun, carried on, and completed by himself alone, extending over a country richer in its variety of rocks than any country of equal extent in the world, and under all the difficulties it has never been surpassed, or even equalled, by any undertaking of a similar nature. In making this survey Dr. MacCulloch had to contend with many hardships, for great part of the whole surveys were made in the most desolate and miserably poor comfortless land. It was his lot to do all the different works provided for in all other surveys by half a dozen men and as many salaries. As a proof of the aptitude which he possessed for the surveying business, we may mention that he steered his own boat through the dangerous channels of the Scottish islands.

Some of the fruits of these separate surveys are published. The first publication was 'A Description of the Western Islands of Scotland, including the Isle of Man, &c.,' 2 vols. 8vo., with 1 vol. 4to. of plates, London and Edinburgh, 1831. Next, 'A Geological Classification of Rocks with Descriptive Synopses, comprising the Elements of Practical Geology,' London, 1831, 1 vol. 8vo. Thirdly, 'The Highlands and Western Isles of Scotland, in a series of Letters to Sir Walter Scott,' London, 1834, 2 vols. 8vo. This work, in addition to a most graphic description of the country, contains many learned dissertations on the history, antiquities, language, music, and economy of the Highlands. Fourthly, A Synopsis of Geology, containing a Plan of the Investigation of the Connection with the Sacred Records,' London, 1831, 2 vols. 8vo. In 1832 he published a 'Treatise on the Art of Making Wines,' which reached a fourth edition in 1838, and in 1839 he published an account of the travels of Blair and Dunkeld, forming a guide-book to those localities. He contributed many papers both to the Encyclopedia Britannica and to Brande's Journal, on various subjects connected with Scotland generally, or its rocks and minerals; besides others on different topics. One of these is a description of twenty-two species of Muscidae found about Shetland and Orkney; so attentive was he to everything that surrounded him. His published writings filled four quarto volumes. He was a member of the 'Social and Medical Society,' and wrote frequently in the Edinburgh, Westminster, and Quarterly Reviews, and in the London and New Monthly Magazines.

Although unable to follow up the practice of his profession, Dr. MacCulloch never lost sight of it, the proofs of which we have in two elaborate works which appeared in 1827 and 1828. The first is entitled 'Malaria, an Essay on the Production and Propagation of this Poison, and on the Nature and Localities of the Places by which it is produced,' &c., 1 vol. 8vo., London. The second is 'An Essay on the Remittent and Intermittent Diseases, including generally Marsh Fever and Nervous Fevers, in which the first who referred a large list of disorders, hitherto deemed anomalous, and which appear to have nothing in common with one another, to their true source—the poison of the malaria.'

In his latter publications Dr. MacCulloch contains important notices of the fact that they must have resulted from deep thought, based on an intimate knowledge of the subjects he treated of. The acquisition of this knowledge was gained by intense study, aided by a wonderfully retentive memory. The variety of his acquirements was not less remarkable than their extent. Allusion has been already made to his knowledge of medicine, geology, mineralogy, chemistry, and mathematics. He was also well acquainted with theology, astronomy, zoology, botany, physics, and the mechanical arts. He was skilled in architecture. He drew well, and has left an immense number of drawings. He was an accomplished musician. He was a proficient in the cith, the harp, and the violin; and yet he was conversant with the theory as well as the practice of the science. His accomplishments, as they are called, were cultivated at times which many persons pass without employment. His entertainments were done while others were employed in walking or riding. His flowers and herbs were examined, dried, and painted before breakfast in the long summer mornings. When he used to practice music, he did so during the days of the most of his employment; and yet he was not less proficient than his contemporaries. The magnitude of his labours appears still more remarkable from the fact, that for many years he was afflicted most severely by the effects of malaria.

In 1804, Dr. MacCulloch received 'Proofs and Illustrations of the Attributes of God, from the Facts and Laws of the Physical Universe; being the Foundation of Natural and Revealed Religion.' It was intended for publication in the following year; but its appearance was delayed by the announcement of the Bridgewater Treatises. In obedience to his last will, it was published in 1837, in 3 vols. 8vo. Many papers on various subjects remain unpublished, and among them a corrected copy, with numerous additions, of his work on the Highlands of Scotland. Dr. MacCulloch was fellow of the Royal, Linnean, and Geological Societies, and at one time vice-president of the last. In 1830 he was appointed physician in ordinary to Prince Leopold of Saxe-Coburg. For some years, and till his death, he filled the situation of lecturer on chemistry and geology at the East India Company's Military Establishment at Addiscombe.

He married, in the summer of 1835, Miss White. He was with her in Cornwall, on a visit to an old friend, when the accident occurred which led to his death on the 21st of August, 1836. He was thrown out of a pony phaeton, by which, in addition to other injuries, his right leg was so shattered that amputation became necessary. He only survived the operation a few hours. He was buried in the churchyard of Guiting, a village near Penzance, in which his family had at one time resided.

Dr. MacCulloch was steady in his attachments, zealous to promote the interests of his friends, and ever ready to aid those who needed his assistance. He possessed very strong affections and acute sensibility, which for so many years seemed rather to have increased than diminished. His manners were courteous; his conversation was rich, varied, apparently exhaustive. He excluded others, and remarkable for its unaffected simplicity. He was as willing to impart information as he was eager to acquire it.

(Principally from the Annual Biogrophy and Obituary for 1836.)

MACDONALD, ANDREW, an unfortunate man of letters, furnishes the theme for one of the most affecting passages in D'Israeli's 'Cautities of Authors.' He was born about 1755, and was the son of a gardener in Leith. After having been educated in the University of Edinburgh, he took orders in the Scottish episcopal church, and in 1777 became pastor of a congregation in the 'New Meeting House,' on the 29th November 1778, a Poetical Fragment,' in Spenser's stanza. This volume was succeeded by a novel called 'The Independent;' and afterwards a tragedy of his, called 'Vimonda,' was played with success in the theatre of Edinburgh, with a prologue written by Henry Mackenzie. Becoming tired of a charge very ill remunerated, and being encouraged by the reception of his play, he resigned his place, and came to Edinburgh; first however marrying the servant-maid of the house he had lodged in, and then living for a short time very extravagantly. He next removed to London, where, in 1787, his tragedy was brought to the stage by Mrs. Siddons with much pomp and very considerable approbation. But the success was short, and he in 1788 he died in London, leaving his wife and child in beggary. A volume of his sermons was published in 1790; and a volume of poems, including 'Vimonda,' was published at this time, appeared in 1791. His dramatic genius cannot be rated high; but he possessed no considerable power both of poetical fancy and of expression. There is a good deal of vigour in some of his light poems, written in London, in the manner of Peter Pindar.

MACDONALD, ETIENNE JACQUES JOSEPH ALEXANDRE, Duke of Tarentum and Marshal of France, was born on the 17th Sept., 1765, at Sancerre in the department of Cher, though some authorities make Sceaux the place of his birth. He was descended from a Scotch family, which, on account of its participation in the revolutions of 1745, was compelled to take refuge in France. He entered the army as a lieutenant in the regiment of Maillebois, and afterwards joined the regiment of Dillon, chiefly composed of Scotch and Irish, in the French service. He was induced, it is said, to remain in France at the breaking out of the Revolution, on account of his attachment to the daughter of Mons. Jacob, who warmly exposed the republican cause. His military talents procured him a place at the commence- ment of the campaign of the army of the General Dumouriez, and he rose to the rank of Captain after the battle of Jemappé; some biographers however state that his valor on that occasion was rewarded with the rank of Colonel. He served in the campaign of the last campaign, and distinguished himself by the passage of the Waal on the ice, under a severe fire from the batteries of Nimeguen, by which exploit the Dutch fleet was captured. Having risen to the rank of General of Division, he succeeded in 1796
at Düsseldorf and Cologne. He then joined the army of the Rhine, and afterwards that of Italy; and when in 1798 the French became masters of Rome, Macdonald was appointed governor of it. His abilities and new capacity appear to have been marked by some severities, but his position was one of extreme difficulty. On the approach of General Mack he was obliged to abandon Rome, and his army was compelled to retreat. The Austrians, however, were defeated, and he was enabled to regain possession of Rome. He was afterwards sent by the French government in their enterprise against the kingdom of Naples, and with a large force he invaded the country. Before the superior force of Suworow, he saved his army, and reconducted it to France by a retreat in which he displayed considerable skill. (Suvorov, 2, C.)

Macdonald had command at Versailles during the period of the revolution of the 18th Brumaire. (Bonaparte, P. C.) In 1800 he was appointed commander-in-chief of the army of reserve in Switzerland. His celebrated passage of the Splugen, the difficulties and difficulties which he surmounted, the persevering ability which he displayed, have rendered his name greatly celebrated in the annals of warfare. There are indeed but two events recorded in history to which this memorable exploit can be compared—the passage of Hannibal over the Alps, and that of Napoleon over the Great St. Bernard. Alison, in an elaborate comparison which he makes between the latter and that of Macdonald, considers that this general had greater difficulties than Hannibal had to surmount, while he had less means at his command to surmount them. (Alison, Hist. of Europe, c. xlix.)

In March, 1802, he was appointed French ambassador at the court of Rome, and on his return to Paris he was created Grand Officer of the Legion of Honour. He afterwards remained some years without employment, on account of the free expression of his sentiments with respect to the conduct of the First French Republic toward General Moreau. (Bonaparte, P. C.; Moreau, P. C.) It was not until the year 1809 that he was recalled to military service, when the command of a division of the army of Italy under Eugene Beauharnais was given to him by the Emperor. Macdonald on this occasion made noble use of the opportunity of renewing his military reputation. The troops under his orders entered Styria; he compelled the Austrian general Meerefeld to capitulate at Laybach (May 22, 1809); and he shared the glories of the victory of Raab. He was present on the 6th July at the famous battle of Wagram; the important duty of forcing the enemy's centre, which was defended by two hundred pieces of cannon, was committed to him, and he executed this critical movement with the most consummate skill and bravery, but with immense loss. On the morning after this great victory, the French were re-renewing the assault when Napoleon passed through the army. Macdonald, stopped, and, holding out his hand as a pledge of their reconciliation, paid him a just tribute of praise for his share in the victory, and as an earnest of his admiration pronounced Marshal Ney's name, as that of a soldier's soldier. The victory was such that two other marshals were created for their distinguished services, Marmont and Oudinot, who afterwards obtained the respective titles of dukes of Ragusa and Reggio. It is also added that Macdonald with affectionate gratitude for the honour conferred, especially for the manner in which it was conferred, pledged himself to abide by the destinies of Napoleon for life or death.

He was afterwards appointed governor of Gratz, where by the strict discipline he maintained among his troops he so conciliated the esteem of the inhabitants, that on his leaving the town they begged his acceptance of a most valuable gift of jewellery, which he refused. On his return to Paris in 1811, he was about to be married. This gift however nobly refused, and added that the best proof of their gratitude towards him would be shown by their care of three hundred sick soldiers, of whom he had charge. (Bonaparte, P. C.) He never add to his military reputation. On one occasion indeed he was engaged in an enterprise which has tarnished the glory of his previous exploits. After the fall of Tornion (March 29, 1814), where he was engaged in the repulse of a Russian detachment by the circuitous route of Maurens. He was attacked on his march by the Spanish general Sanfield, and his troops met with a determined opposition on the bridge of Manresa; this obstacle overcome, the French, or rather the Italians in the French service, forced their way through the town, whose inhabitants offered them no resistance, and they wreaked their vengeance upon it by setting fire to its buildings. Seven hundred Frenchmen perished in this attack on St. Helena, and it is to be regretted that Macdonald, who witnessed the configuration, made no efforts to put a stop to it, and offered no assistance to the sufferers. This unnecessary cruelty was conveyed to the Emperor, who was indignant at it, and attributed it to all its vigour that guerrilla warfare which proved so harassing in its effects and so important in its ultimate results.

In 1812 Macdonald accompanied Napoleon in the expedition to Russia. He was ordered to precede the main army under Suvorow, to attack and envelop Marshal Blücher, who was at the head of an army very superior in numbers to his own, which was impudently scattered over a space of thirty miles from Liegnitz to Silesien; so that when attacked on his centre and his left by the concentrated masses of the Prussians, he had no adequate force at hand to arrest the onset of the enemy. The result of this engagement was the loss of one of his divisions, that commanded by Pothu, one hundred officers, including Pothu himself and all his staff. Three thousand soldiers became prisoners; twelve pieces of artillery also fell into the hands of the enemy. At the great and disastrous battle of Leipzig, in which Marshal Ney was killed, Macdonald was enabled to swim safely across the Elster. (Poniatowsky, P. C.)

In 1814 Marshal Macdonald faithfully redeemed the pledge of the court of Napoleon on the field of Wagram, and constantly adhered to his declining fortune; he also warmly exerted himself with the allies to obtain favourable terms for the emperor and his family. He was with him at Fontainebleau (Bonaparte, P. C.). Napoleon expressed to him his regret at not having before appreciated his value, and presented him with a splendid Turkish sword, the gift of Abraham Bey.

On the first restoration of the Bourbons, he was called to the chamber of peers, where he proposed several measures of justice towards the returned emigres and the veterans of Napoleon's army. These just and expeditious proposals were however rejected.

When his former chief returned from Elba, this marshal was solicited to accept a command which his loyalty refused. He proceeded to Lyon to join the Count d'Artois, afterwards Charles X, and endeavoured, though fruitlessly, to induce the troops to remain faithful to the Bourbon cause. On his failure he returned to Paris, and when Napoleon approached the capital he was appointed to the command of the royal guard. (Poniatowsky, P. C.)

On the 20th March, 1815, the marshal of the Bourbons was named chancellor of the Legion of Honour (Legion of Honour, P. C. S.), which office he retained till 1831. He likewise received the appointment of governor of the twenty-first military division, and that of major-general of the Royal Guard. The rest of Macdonald's life appears to have been chiefly passed in tranquil occupations on his estates. He visited Scotland, where he showed much kindness to some relatives whom he found in the Highlands in humble circumstances. He died at Paris on 24th September, 1840.

Marshal Macdonald, though not the most distinguished of Napoleon's generals for his military service, has not been surpassed by any in his constancy, integrity, interestlessness, and in the maintenance of honourable principles. His highest praise is perhaps to be found in the brief but expressive remark made concerning him by Napoleon at St. Helena: 'Marshal Macdonald was a man of great loyalty.' (Alison, Hist. of Europe, vols. ii. iv. and ix.; Court and Camp of Napoleon; Las Cases, Mémoires de St. Hilaire; Dict. Hist. des Batallies; Biographie Moderne, Paris, 1815; Macdonald, Histoire de l'Armée, 1813.)

MACER, AEMILIUS, a Roman juris, who lived under the Emperor Alexander Severus, or shortly after his time. He was either a contemporary of Ulpian, or wrote after him. He was born at Ulpianus, the son of a man of the same name. He was a lawyer, and one of the legal writers, and his commentaries are in the Digest of Justinian. He is also known of the Digests of all the important cases. He was a member of the Roman Senate, and was a writer on public and private jurisdiction. He was also a writer on public and private jurisdiction.
and two on Appellations. According to Priscian he also wrote Annales.

MACHINERY. It is proposed to consider in this article the influence which is exercised by machinery upon the general interests of mankind, and especially upon the well-being of the laboring classes. There is no subject in the present age which is more deserving of investigation; and none perhaps in which all classes are so much concerned. Whatever theoretical opinions may be entertained by speculation upon points to point of detail, the laboring man, upon whom, as a content, instead of it, is rapidly increasing and cannot be restrained; it is right therefore for all men to endeavour to judge for themselves in what manner it is valuable to society, and to decide who are its real beneficiaries.

By some, every new machine is viewed as an addition to the wealth and resources of a country; by others it is regarded as a hateful rival of human industry—as iron contending with straining steams—as steam struggling against the life and blood of man. The one view is full of hope and promise; the other is fraught with gloom and sadness. One would present society advancing in wealth and comfort; the other would show it descending faster and faster into wretchedness. But even those who believe that the inventive faculties of men have been engaged in devising for themselves a curse, would gladly be convinced that cheerful anticipations of good are consistent with sound philosophy.

The influence of machinery is of two kinds: 1st, as it affects the production and consumption of commodities; and 2ndly, as it affects the employment of labour.

As to the first condition of machinery, it has been well described to be the same as if every man among us had become suddenly much stronger and more industrious. (Results of Machinery, 7th ed., p. 36.) If, by the aid of machinery, ten men can perform the work of twenty, and perfect it better and more quickly, the products of their labour are as much increased as if they had really become suddenly much stronger and more industrious; and, it may be added, more skilful. Thus production, which is the object of all labour, is more abundant; and society enjoys the results of industry at a less cost. Who can doubt that this is a great benefit, unless it be attended with evils which are not at first perceptible? No man labours more than is necessary to effect his object; and his constant desire is to contrive modes of saving his own physical exertions. A rich soil and a fine climate are universally esteemed as blessings because the people enjoy abundance with comparatively little labour. A poor soil and climate are evils, because the husbandman must labour much though the produce of his industry be small.

Labour without adequate results is always regarded as a curse, and almost every human invention, from the earliest times, has had for its objects the saving of labour and the increase of production. Horses and other beasts of burden were man's first attempt to economise his labour; the cogs that must have borne themselves; to draw the plough which otherwise their own strength must have forced through the soil. To the same object all nature has been made subservient. The strength of animals is made use of by them in proportion as the wind performs the same office. A boat is built to save men the labour of carrying their goods to a distance, and it is less labour to row the boat than to carry its cargo: but rowing is laborious, and sails were invented that the wind should do the work of man. In all other matters it has been the same. Man is weak in body, and ill endowed by nature with the means of self-preservation and subsistence. Many animals are stronger and more skilful; they are more active than himself: they can pursue their prey with more certainty, they are armed with weapons of offence and defence, and they need no shelter from the weather but that which nature has provided; their own strength need not be exerted in self-preservation. But man was created naked and defenceless. To live he must invent, and reason was given to him that he might force all nature into his service. His teeth and nails were made of his own body to enable him to eat, and keep his bones from his body. The wants of his hands were formed with wonderful aptitude for executing the tasks which reason set him. He invented tools and implements and weapons, and all nature became his slave. He was no more able to overcome the obstacles in his way as if he had become stronger and more industrious. He produced more for his own comfort and subsistence, with little labour, than the greatest exertions could otherwise have obtained for him. The world had become more productive: but that is the most perfect invention which attains this object the most effectually. Can any one doubt the advantage of abundant production? It needs but a few men to produce what otherwise might be done by a hundred, or a thousand. The world will be a better place for good; we are not satisfied with the enjoyment of the common necessary of life; we all desire comforts, luxuries, and ornament; and in proportion as we desire them we become more civilized. The more we desire and are able to enjoy, the more happily it has its vices, its follies, and its absurdities; but it seems the law of our nature to advance to that state, and with the increase of artificial wants our intellect becomes more active and enlightened, refinement of manners succeeds to barbarism, and all those moral qualities for which man is distinguished, become developed. We may conceive some Utopia in which all the noble parts of man's nature are cultivated, while his wants remain simple and easily satisfied, but the world we live in presents another picture. We might wish it were otherwise; but it is in vain to deny that refinement is the accomplishment and, in some degree, the consequence of riches, and benevolence the condition of those people who have not been elevated by the increase of wealth. It follows therefore that to multiply the objects of comfort and enjoyment which human industry can produce, is to improve the moral and intellectual being, and to minister to their enjoyment of life. It is quite consistent to deprecate the vices and follies which are ever associated with our craving for new possessions, while we observe the benefits resulting from it. Throughout the world good and evil are found side by side; but the good, as we would fan believe, preponderates.

When once it is admitted that men are to be described as housed and clothed, and are as nearly as possible equipped with the things necessary for the enjoyment of life, and are content with them, there would be no poverty, and infinitely less vice. Machinery, by diminishing the amount of labour required for the production of commodities, lowers their price and renders them more universally accessible to all classes of society. Working-men no longer toil for the rich alone, but they participate in the results of their own industry. If they desire such luxuries "purple and fine linen" are not beyond their reach; and their dwellings are more commodious and often more elegant than were the houses of the rich three centuries ago. If this increased facility of acquiring the comforts of life has been frequently complained of, it is because men have not sufficiently understood that the beneficial results of machinery would have been conspicuously shown by the improved condition of all the working classes of this country; but more money has been squandered on the wars of the nation than would have sufficed to place themselves and their children beyond the reach of want.* Cheap production is more beneficial to the poor than to the rich. The rich man is certain of gratifying most of his wants, but the poor man is constantly obliged to forgo one enjoyment in order to obtain another. If his shoes or his coat be worn out, his dinner must be stinted perhaps until he can pay for a fresh supply; and thus, unless his wages be reduced, and his position not raised, the benefits of the new condition of things are not enjoyed as much as had been expected. The money which he saves in the purchase of one cheap article is laid out upon another, and the same effect of expenditure is produced. The man who is in debt has no custom made imperious. In short, he is no longer poor.

These facts are undeniable; but it is alleged that machinery not only makes articles abundant and cheap, but multiplies articles to such an extent that there is no room for the consumption of all that is produced. Every new machine operated by steam brings ruin and misery upon the working classes. For reasons explained elsewhere (Demand and Supply, P. C. S.) a universal glut of all commodities is impossible; the more men produce, the more they have to offer in exchange; and for

* The amount spent annually upon spirits is equal to the interest of the national debt; and the amount spent in the United States in the purchase of foreign luxuries is estimated at considerably more than the entire capital of the United States. Six millions a year are annually sent abroad in foreign purchases. It is supposed that some idea may be formed of the property of the sequestering classes of the present day, if it be considered a band preserving an allowance of thirty dollars beyond the wages for ten labourers.
wants are only limited by their means of purchasing. But particular commodities are frequently produced in excess, and a glut of the market ensues. In causing such gluts machinery is a powerful agent, but only in the same manner as all labour would be, if applied in excess. The results would be precisely the same as with all other commodities. They would produce more than there was a demand for, and their goods would fall in value or be unsaleable. Commodities produced by machinery are subject to the same laws as govern all other commodities. If the supply of them exceed the demand, they are depreciated in value; but the power of producing with facility does not necessitate an excess of production. It must be supplied with caution, and its use be properly learned by experience. Suppose that the soil of any isolated country were extraordinarily fertile and the population very small; but that without considering these circumstances the people were determined to cultivate the whole of their land and bestow upon it all their skill and labour. An excess of food would be the result—more than could be eaten within the year; much would be wasted or sold without profit, and much laid up in store for another season. The husbandsmen would be disappointed at the unfortunate result of their industry, but would they complain of the fertility of the soil? It would not be the soil that had caused the evil, but the one's misused energies; and again it is with machinery, which like a fertile soil gives forth abundance: its capabilities are known and its advantages ought to be appreciated; but if its productivity be brought into practice it gives rise to a glut. It is important also to note the influence of machinery upon the production and consumption of commodities need not be followed any further. It increases the common stock of wealth in the world and is capable of extending the means of human enjoyment. But these benefits will be neutralized if, while it increases production, it has a tendency to diminish the means of employment for the people and the wages of labour; and this could be second only to the loss of the use of machinery. 

The invention of a machine which should immediately do the work of many men employed in a particular trade would certainly, in the first instance, diminish employment in that trade; but it might be turned out of employment in other trades, and much individual suffering would be occasioned. There have been frequent instances of such a result, and as far as the immediate interests of the particular sufferers are concerned, it is an evil which cannot be too much lamented. In their case machinery is like a rival bidding against their labour, and is as injurious to them as if a fresh set of workmen had supplanted them in the service of their employer. But great as this evil is (and we would not underrate it) it is of comparatively rare occurrence and of short duration. If the invention of the machine caused no more production than the labourers had previously accomplished, the labour of a certain number of men would be permanently displaced: but as an equal quantity of goods is produced at a less cost of labour, their price is reduced and their consumption consequently increased. An increase of employment with an increased population is thus assured for; and more workmen are again required in the trade. In this manner the demand for increased production corrects the tendency which machinery would otherwise have to displace labour permanently. Even the temporary displacement which frequently occurs is less extensive than might be supposed. Machines are rarely invented which at once dispense with many workmen. They are at first imperfect, and of limited power; they make the labour of the workmen more efficient; but do not become substitutes for labour. Thus, even if the demand for commodities were not increased, the displacement of labour would be very limited and deferred to a distant period. The increased productivity and increased demand for increased machinery in every successive improvement in machinery, it will be found, practically, that more operatives are employed in every branch of manufacture, after the introduction of improved machinery than before it began.

Of this fact we shall offer some examples presently; but here it may be necessary to allude to the case of the handloom weavers, which is constantly adduced in proof of the supposed wage-earning capacity of machinery. The case is scarcely overstated, nor can it be denied that it has been caused by machinery: but it must be recollected that while they have rarely contended against machinery—like pigeons against hawks—they have not met in thousands of hostile classes, unskilled and accustomed to the labour of operatives, have gained a profitable employment by working with it, in the same trade as themselves. No one can suppose that the labour of the hands could compete with the power of steam, and the real cause of their distress is, that instead of adapting the form of their industry to the altered circumstances of their trade, they have continued to work, like an Indian caste, with the same rude implements which their fathers used before them. Their case has not been the same as that of the millers who should persist in grinding corn by hand, while his neighbours were building mills upon a rapid stream which ran beside his garden. His own ignorance or obstinacy, and not the stream, would be the cause of the failure of his agricultural operations. If the case of the handloom weavers be adduced as an example of the permanent displacement of labour by machinery, it is only because if it is the result of the application of machinery to diminish employment in other trades in the same manner we must necessarily infer that wherever machinery has been largely introduced into any trade, the number of persons supported by it must have been diminished. We should infer that the agricultural population of this country must have been rapidly increasing, while the population engaged in those branches of manufacture in which steam-power is used must have been falling off or increasing less rapidly. The correctness of such an inference may be estimated from the following facts:

In no trades has machinery been so extensively introduced as in the manufacturing of cotton and silk, and nowhere has the population increased so rapidly as in the principal seats of such manufactures. Between 1801 and 1841, Manchester increased in population from 90,866 to 293,185, or 202 per cent.; Stockport from 26,707 to 78,275, or 194 per cent.; and Oldham from 21,412 to 56,935, or 167 per cent. (by the cotton trade) increased, in the same period, from 75,722 to 264,298, or 221 per cent.; Leeds, from 53,162 to 161,874, or 148 per cent.; Bradford (York), from 6898 to 42,646, or 517 per cent.; Beverley from 3457 to 46,123, or 1387 per cent.; Huddersfield, from 7268 to 25,065, or 2443 per cent.; Manchester, from 8743 to 24,173, or 176 per cent.; and Dukinfield from 1737 to 22,384, or 1190 per cent. In Scotland the same result is shown in the increase of the use of machinery. Between 1801 and 1841 Glasgow increased from 77,885 to 274,533, or 254 per cent.; Paisley, from 31,179 to 80,487, or 164 per cent.; and Greenock, from 17,486 to 82,611, or 367 per cent.

Thus far of the manufacture of cotton, wool, and silk. The seats of the iron and hardware trades exhibit similar results. In the same period of forty years Birmingham increased from 78,670 to 190,549, or 155 per cent.; Sheffield, from 31,814 to 65,188, or 117 per cent.; Wolverhampton, from 12,665 to 36,383, or 189 per cent.; Matlock Tydvil, from 7705 to 94,947, or 1203 per cent.; and West Bromwich from 6087 to 26,121, or 328 per cent.

In this extraordinar y ratio has the population increased in the seats of our staple manufactures, which by the aid of machinery have supplied the world with articles wrought by the industry of other people. Let us take as a parallel the places with those agricultural counties in which machinery has exercised the least influence, and let us see if the absence of machinery is equivalent to a slow and stagnating growing population. In the same period, between 1801 and 1841, Devon increased 55.3 per cent.; Somerset, 59 per cent.; Norfolk, 50.5; Lincoln, 75.9; Essex, 53; and Suffork, 49.5 per cent. The average increase of these six agricultural counties did not exceed 50 per cent. in forty years; while, setting aside the extraordinary increase exhibited in the particular towns already enumerated, the population of six manufacturing counties, viz. Lancaster, Middlesbrough, York, W. R., Stafford, Chester, and Durham, including all the agricultural, increased 112.5 per cent.

These facts prove conclusively that machinery, so far from diminishing the employable power of the people, has, on the contrary, considerably increased it. Mere habit of trade is an important qualification in this respect. 

It has been shown that machinery has had a beneficial influence upon the employment of labour in the particular trades in which it is used, increases it in an extraordinary degree. And not only does it give employment to larger numbers of persons, but their wages are considerably higher. We shall not attempt to compare the increments of capital and labour with that of operatives engaged in the infinite variety of trades carried on in manufacturing towns, in connexion with machinery, but it is enough to ask, whence has come the increased productive power of the nation? The answer is to be seen in the large increase which has been comparatively insignificant if thousands had not been transferred to the towns from other places. And what could have induced them to leave their homes and engage in new trades if the employment offered by more certain employment and higher wages? It is clear to all who have observed the progress of business in different parts of the country that the great increase of numbers employed in the manufacturing districts is simply an error in the account books of the employers, and that the real cause of the increase of population is the increase of the purchasing power of that class of the community which is the most productive and which is the most entitled to demand and to receive an increase of wages for the services which they render to society.
In which it has been used, and it now remains to consider its effects upon the employment of labour in other trades. In the first place, a few of its obvious results may be noticed. For example, the manufacture and repair of machinery alone gives employment, directly and indirectly, to vast numbers of persons who are engaged in the employment of labour in the similar trades in which the machinery itself is used. Again, the production of all commodities is increased by machinery; and thus the producers of the raw materials of machinery, the carriers of goods, those who keep, clean and tend the machinery, their clerks, porters, and others, must find more employment. It is clear also, that while the manufacturing and commercial population are thus increased by the use of machinery, the agricultural population must receive more employment in supplying them with food.

In this and other ways the general employment of labour is directly extended by machinery. At the same time the application of machinery to existing branches of industry creates new trades and distributes capital into other enterprises which afford employment for new descriptions of labour. A hundred examples of this fact might be cited; of which railways and steam navigation are amongst the most remarkable; but such examples will be superfluous if it can be shown that it is the necessary result of the use of machinery to apply capital to new enterprises. It has been already denied only on the production by reducing the amount of capital employed upon it: it follows that a less amount of capital with the aid of machinery will produce as much as a larger capital without such aid. A portion of capital may be saved for latterly increased production by employing the same capital, or for application to new speculations. In some way it must be employed, or it will yield no profit, and in some form or other it must be ultimately expended, and the capital accordingly reduced to the accustomed operations of his own trade with a profit, he is disposed to do so; but as soon as he finds them less profitable than other investments, he changes the direction of his capital, and seeks new modes of increasing its profits; and thus, if in any country capital be increasing more rapidly than the population, employment will be abundant and wages high; if less rapidly, employment will be scarce and wages low. In the one case, capitalists will be bidding high for labour; in the other, labourers will be bidding against each other for employment. Accumulation of capital is therefore highly conducive to the interests of the labouring population generally, and the use of machinery is especially favourable to accumulation, as may be shown by a simple example. Suppose a man to have a capital of 10,000l., which he is expending annually upon labour in a particular trade, and by proper management succeeds in obtaining 10 per cent profit. Each year his whole capital is expended, and his means of accumulation are thus restricted to a portion of his annual profits only. But let him invent a machine to facilitate his business, and borrow a capital of 3000l. which he can annually repay with interest of 8 per cent. The machine should cost 500l., and the other 5000l. be still expended in labour, he may be said to have saved one half of his entire capital in a single year; for instead of spending the whole of it as before, in labour, he is possessed of a durable property which, at a small annual cost, will last for ten or probably twenty years. Nor can it be said that this saving is effected at the expense of labour; for the owner of the machine is placed in a situation in respect to his profits, which prevents him from securing to himself the difference between the amount paid now and that previously paid for labour. To gain a profit of ten per cent, it had been necessary to spend 10l. annually upon wages, but the possession of the machine, to realize 11,000l. annually, being his whole capital and the profits upon it; but now, in order to obtain the same profit, it is sufficient if he realize 6000l. only: viz., 500l. profit upon his capital recaptured, and 4500l. profit from the use of his machine, to realize 11,000l. annually, being his whole capital and the profits upon it: but now, in order to obtain the same profit, it is sufficient if he realize 6000l. only: viz., 500l. profit upon his capital recaptured, and 4500l. profit from the use of his machine, to realize 11,000l. annually, being his whole capital and the profits upon it: but now, in order to obtain the same profit, it is sufficient if he realize 6000l. only: viz., 500l. profit upon his capital recaptured, and 4500l. profit from the use of his machine.

MACKENZIE, HENRY, was born at Edinburgh in August, 1746. He was the son of Dr. Joshua Mackenzie, a physician in extensive practice and of literary habits. His mother belonged to an ancient family in the county of Nairn. He was educated at the high school and university of his native city; and in 1764 began to study law in Scotland. In 1769 he was called to the Bar, and in 1770 was admitted as a member of the Scottish Court of Exchequer, a department of law-business which is now all but extinct, and which then was extremely limited, and conducted by a few practitioners specially appointed for the purpose. He lived a life of leisure and retirement, and while he was held this place, must have left him abundant leisure for indulging his literary tastes. While in London in 1765, studying the English practice in Exchequer, he had begun to write his earliest and best novel, 'The Man of Feeling,' which was published anonymously in 1771, and for some years was not acknowledged by the author. In 1783 he published his second novel, 'The Man of the World,' and next came 'Julia de Robigni,' his last considerable work of this class. Meantime he had edited two well-known periodicals in the manner of the Spectator: 'The Mirror,' which continued to appear for seventeen months from January, 1779, and 'The Lounger,' which, begun in February, 1775, came to a close about two years afterwards. To the former Mr. Mackenzie contributed forty-two papers; to the latter fifty-seven. Among these are his small novels, such as 'The Storm of the Reoch,' and a collection of dramatic translations, which was one of the earliest races that drew the attention of Walter Scott to German literature. The Highland Society likewise published in their Transactions papers of his on the Highland games, and on the literature of the country of the Osian Controversy. In 1783 he wrote, for an edition of the works of the blind poet Blacklock, a memoir of the author; and a Life of John Home, the author of 'Douglas,'
which he read to the Royal Society of Edinburgh in 1812, was afterwards prefixed to an edition of Home's works, and also published separately. Mr. Mackenzie himself wrote several plays, which are more remarkable for refinement of feeling and language, than for dramatic force or effectiveness. The collected edition of his works contains three of these: 'The White Hypocrite,' a comedy, which was once performed at Covent Garden; 'The Spanish Father,' a tragedy, which Robert Burns had declined to bring on the stage on account of the harassing nature of the cast; and 'The Prince of Tunis,' which had been acted at Edinburgh with much applause in 1775, and printed separately the same year.

The original was by the political writer Lord Melville. His most elaborate work of this sort was 'An Account of the Proceedings of the Parliament of 1784,' which was revised and corrected by Mr. Pitt's own hand; and he published some anti-Jacobin tracts at the time of the French Revolution.

The merit of these services to the government, set forth by his friends Lord Melville and Mr. George Rose, procured for him in 1804 the place of comptroller of taxes for Scotland, an office of large emolument, but considerable labour and responsibility, which he held thenceforth till his death.

In 1808 he edited a complete collection of his literary works, in eight octavo volumes; and this was almost his last contribution to literature. 'The old stump,' as he himself once said, 'would still sometimes send forth a few green shoots; but his official duties occupied much of his time; and the romantic fervour of sentiment, which had produced the figures or effects, was the way to produce the habits of thinking and feeling, such as a man of business may unite with literary tastes and a fondness for literary amusement. Indeed that tendency to stickily refinement, which characterized the major novels, interested the interest of the visionary mind essential to success in the highest walks of literary invention; and he is not the only case in which this cast has put forth all its strength in youth, and been overborne in mature years by the exigencies of life.

Accordingly, for many years, Mr. Mackenzie's leisure was spent either in the society of literary and other friends, or in shooting and sports to which he was particularly attached, and which he pursued as long as his strength permitted. His old age was healthy, cheerful, and happy: a slight deafness alone indicated the decay of nature. He, who had in youth breakfasted with Dr. Johnson, and who had enjoyed the friendship of Blair and Robertson and Adam Smith, lived to see one generation after another, and revolution after revolution in the phenomena of literature.

He had married the daughter of Sir Ludovic Grant of Grant, and by this lady he had eleven children, one of whom has long been a judge in the Supreme Court of Scotland. Henry Mackenzie died in Edinburgh on the 14th of January, 1831. He was buried in the churchyard of the Greyfriars, in the middle of that of a Gregorian telescope; this was to be placed in the interior of the lantern with its polished surface towards the light and its convexity towards the object. The light was concentrated so that none could pass through the aperture in front of the lantern so as to fall on the screen; and that which was reflected from the concave mirror after falling upon one with a plane surface, was from thence to be reflected in a contrary direction upon the object.

The rays in the pencils proceeding from the object were to pass through a lens in the tube, as in the former construction; and, by converging with greater accuracy to points on the screen, they would have produced a more correct image than that which results from refractions light alone.

A remarkable improvement in the manner of employing the magic lantern was first exhibited in London in the year 1809, by William Ford, which serves for more general purposes; and the sliding tube which carries the farthest lens has a greater range of motion. The objects to be exhibited are painted upon a glass plate, which is supported in a groove in the support, and the machine is placed upon a stage which is capable of being moved on wheels in a direction perpendicular to the screen on which the objects are represented.

The screen is usually covered with muslin or gauze, and covered with varnish so as to be quite transparent: it is stretched in a vertical position across the theatre or apartment; and is capable of being made quite dark, the spectacies occupy the space in front of the screen as placed on the opposite side.

In any magic lantern when the tube carrying the lens which is farthest from the lamp is drawn out as much as pos-
able, the magnitude of the image represented on a screen is the smallest; that image increases in magnitude in proportion as the tubes are diminished in length, or as the lens is brought nearer to the body of the lantern. It increases also in proportion as the screen is made nearer to the screen; and the variations of the length of the tubes must, by the exhibitor, be combined with the different distances of the lantern from the screen, in order that by the just convergence of the rays in each pencil, on the screen, the proper degree of distinctness of vision may be obtained under all the variations in the magnitude of the image.

Care is taken that during the exhibition all light shall be excluded, and that the screen shall be dark; but, however, in which, in proceeding from the lantern, produces the image to be observed; and the screen being itself invizable, the spectators can scarcely divest themselves of the idea that they are looking into a dark cavern, in which the objects, at first dimly visible as specks in its deepest recesses, appear to be gradually advancing towards them, increasing in magnitude as they seem to approach: after the objects have been some time apparently in the immediate presence of the company, perhaps surrounded by a blaze of light, they seem to gradually retire, and at length vanish, leaving the place in profound darkness. The effect of the exhibition is, moreover; hence, connected with the harmonious arrangement of instrumental sounds, according to the character of the object, from musical instruments disposed for the purpose.

Spectres are frequently exhibited in this manner; but occasionally observed; and the figures, of celebrated personages are shown; and the illusion produced have caused the name of Phantasmagoria to be applied to the apparatus.

MAGISTRATE, a word derived from the Latin magistratus, which contains the same element as magnus and magister, and signifies both a person and an office. A Roman magistratus is defined to be one who presides in a court and declares the law, that is, a judge. The kings of Rome were probably the sole Magistratus originally, and on their expulsion the two consuls were the Magistratus. In course of time other offices, as those of praetor and Aedile, were created; and those who filled these offices were elected in the forms prescribed by the constitution, and they had jurisdiction. [Genascontr.] The original notion of a magistratus, then, is one who is elected to an office, and has jurisdiction.

In England the term magistrate is usually applied to justices of the peace in the country, and to those called police magistrates, such as there are in London. It has also been applied in other ways; for instance, people have sometimes said that the king is the chief magistrate in the state. But these applications of the term do not agree with its proper severe character; the chief magistrate of a state is that which is derived from a justice of the peace; he also exercised delegated power in his jurisdiction, in which respect, as well as being elected, he is differed from the king of England, who is not elected to the office, and has no delegated jurisdiction, but delegates jurisdiction to others.

MAGNETISM, ANIMAL. [Animal Magnetism, P. C. and P. C. S. MAGNETOMETER] is the name given to a magnetized bar of steel, of considerable dimensions compared with the needle of an ordinary compass, which is employed to determine either the absolute amount of magnetic declination (commonly called the variation of the needle) or the resolved intensities of terrestrial magnetism in horizontal or vertical directions. It has the names of declination magnetometer, and vertical or horizontal force magnetometer, according to the purpose to which it is applied.

The declination magnetometer is of various sizes; for general purposes it is from 12 to 15 inches long, 1 inch broad, and 4 inch thick; but that which is mounted in the Greenwich Observatory is 2 feet long, 4 inches broad, and 3 inch thick: the bar is placed so as to rest at the middle of its length, within a sort of stirrup made of gun-metal, and this, at its other end, has a triangular socket with which it passes a metal cylinder. A skein or a number of fibres of untwisted silk, from 3 feet to 8 or 9 feet long, attached to the middle part of the cylinder, passes over a pulley at the top of the instrument, and a second pulley at the bottom, where it descends, is connected with a small windlass, in order that the bar may be raised or lowered: thus the bar is suspended in a horizontal position, with freedom to turn on a vertical axis till it rests in the plane of the magnetic meridian. The whole apparatus is contained in a box of wood, in order to protect it from the agitation of the air, glazed apertures being provided for the purpose of allowing the observations to be made.

In some constructions, near each extremity of the magnetic bar is a sliding frame of gun-metal: one of these frames carries a small glass plate on which is a graduated scale, and the other carries an achromatic lens, the focus of which coincides with the scale. A small pointer is placed at a certain distance in the direction of the magnetometer the graduations on the scale may be observed through the lens, so that the instrument becomes a sort of collimator; and by means of this, a number of red lines striking the pointer in the wire of the eye-piece of the telescope, the absolute position of the axis of the bar and any variations in its position may be observed.

The stand which carries the suspending fibres of silk generally consists of two pillars of copper, firmly supported on a stone base; and at the upper extremity the apparatus to which the silk fibres are attached is connected with a horizontal circle, graduated, for the purpose of determining the value of any torsion which may exist in the fibres.

Previously to placing the magnetometer in the stirrup, a bar of gun-metal, called a detorsion bar, equal in weight to the magnetometer, and like it, furnished with a graduated scale and lens, is suspended by the silk fibres: this is allowed to vibrate till it comes to a state of rest; the angle which its scale makes with the plane of the magnetic meridian is then taken, and by finding from the readings converted into angular space (the distance of the telescope from the scale being the radius) is the deviation of the optical axis of the telescope from the magnetic meridian.

The telescope having a movement in azimuth, it must then be turned through an angle equal to the deviation, and thus brought into the plane of that meridian. The apparatus would then be ready for use if it were not that some remains of torsion may exist in the fibres, which must be corrected by means of the detorsion apparatus as before.

When it is required to determine the absolute declination, the point which indicates on the scale the direction of the angle between the plane of the magnetic meridian, and the plane of the scale in the telescope, and a correction made for any existing error of collimation, the telescope is turned horizontally to some terrestrial object whose azimuth from the astronomical meridian is known. The difference between the direction of the telescope and the angle through which the telescope was turned will evidently be the required declination, or the angle between the planes of the astronomical and magnetic meridians.

After the actual position of the magnetic meridian has been determined as above, any deviations of the axis of the magnetometer from it, indicated by a different division of the scale coinciding with the vertical wire of the telescope, will denote a variation of the declination; but it is evident that such deviation will be affected by the torsion induced in the silk fibres in consequence of the angular movement of the magnet.

The correction due to this cause of error is to be found from an experimental determination of the relation between the force of terrestrial magnetism and the force of torsion: thus, a magnetized bar being already in the plane of the magnetic meridian, let the torsion circle be turned on its axis till a radius of it has described a small angle (the angle of torsion), and let the position of the magnetometer be observed when it rests between the force of torsion thus created, by which it is made to deviate from the meridian, and the horizontal force of magnetism by which it is drawn towards the meridian. Then, by mechanics, the force (M) of magnetism is to the force (T) of torsion as the difference between the angle of torsion and the angular distance of the bar from the meridian is to the latter distance; or, by proportion, M - T is to M as the given angle of torsion is to the difference between that angle and the distance of the needle from the meridian. The last ratio being obtained from an experiment,
holds good for any corresponding observation; consequently the observed changes of declination must be increased in the ratio of $M$ to $T + M$, or be multiplied by $T + M$, in order to have the correct changes.

When it is required to determine the absolute horizontal intensity of terrestrial magnetism with an apparatus like that which has been described, a magnetic bar of the same dimensions as that which is suspended is used with the latter: this is called a deflecting bar. It is placed in the direction of a horizontal line passing through the centre of the suspended magnet, perpendicular to the magnetic meridian, at two different distances, $R$ and $R'$, from that centre; and the angular deflections produced by its actions on the suspended bar are observed; first, when the north end of the deflecting bar, at each distance, is towards the east, and again when it is towards the west. Half the difference between the observed deflections at the two distances is taken as a mean deflection.

A second mean deflection is obtained from observations made in like manner with the deflecting bar on the opposite side of the suspended bar: let these mean angular deflections be represented by $\theta$ and $\theta'$; then the formula
\[
\frac{n_R}{(R^2 - n)M} = m \tan \theta - m R \tan \theta' - T + M
\]

investigated by M. Gauss, will give the ratio of the force $m$ of magnetism in the bar to the horizontal force $F$ of the earth's magnetism, or the value of $m / F$. The second factor is the correction on account of the force of torsion in the suspending silk.

The value of $m F$, or the momentum of the horizontal force of the earth's magnetism on the suspended bar, may be computed. For, representing the momentum of the bar, with respect to a vertical axis passing through its centre of gravity by $N (N = \frac{1}{2} \mu (a^2 + b^2)$ in which $a$ is the length, $b$ the breadth, and $\mu$ the mass of the bar, whose form is rectangular), $m F / N$ denotes the angular velocity of the bar. But, by mechanics, the angular velocity of a suspended body is expressed by $\frac{d\phi}{d\tau}$ (being the force of gravity, and $\tau$ the distance from the centre of suspension to that of oscillation in the magnetometer), or by its equivalent $\frac{d\phi}{d\tau} = \frac{m F}{T}$, where $T$ is the observed time in which the magnet makes one vibration; therefore, applying thus the correction for torsion,

\[
m F \frac{T + M}{T} = \frac{\frac{1}{2} \mu (a^2 + b^2)}{
\frac{m F}{N} \frac{T + M}{T}
\]

From the values of $m F$ and $m F$, the value of $F$, the required intensity of magnetism in the horizontal direction, may be found.

The biliary magnetometer, invented by M. Gauss for determining both the absolute amount of the horizontal intensity of magnetism and its variations, has been noticed under TERRITORIAL MAGNETISM, F. C. The horizontal force magnetometer at the Greenwich Observatory is biliary, and of the same dimensions as the declination magnetometer. Below it, and under the centre of motive, is fixed a mirror in a vertical plane, but oblique to one passing through the magnetic axis of the bar: this reflects to the eye of the observer a scale which is applied to the opposite side of the apartment, and the telescope being directed to the mirror, in which the magnet declines more or less from the meridian, the numbers which on the scale appear in coincidence with a wire in the telescope increase or diminish. Thus the variations of the horizontal intensity are obtained.

The instrument is held nearly perpendicularly to the magnetic meridian by the force of torsion in the two halves of the skein of silk by which it is suspended: these parts are each about 6 feet in length, and when tied in a loop to the bar, as it surrounds the magnet in a vertical plane, serves to diminish the extent to which the bar would vibrate; and both rings and bar are contained in a double rectangular box, one side of which is plain glass, the box being covered with gilt paper, in order to obliterate the effect of electricity in the apparatus.

The suspended bar being in equilibrio between the forces of torsion and the horizontal force of magnetism, it is evident that if the former force be computed, the latter will be obtained. In order to determine the variations of the horizontal force by the observed deviations of the bar from its mean place the following formula is employed:

\[
dF' \frac{F'}{F} = -\cotan \theta d\phi,
\]

in which $F'$ is the absolute horizontal force, $dF'$ its variation, $\theta$ the angle between a vertical plane passing through a line connecting the upper extremities, and one passing through a line connecting the lower extremities of the two parts of the suspending line; $d\phi$ is the observed deviation of the axis of the needle from its mean place, and is expressed by the length of an arc in terms of the radius. $F'$ evidently gives the variation of the horizontal intensity in parts of its absolute value.

The vertical force magnetometer is a magnetized bar which is crossed in the middle by a short axe perpendicular to its length, and has its lower part, on one side, reduced to an edge. This knife-edge, as it is called, passes nearly through the centre of gravity of the bar, and rests, on each side of the bar, on an agate plane; the whole is supported on a short copper stand, which rests on the instrument. For the purposes of adjustment the bar is furnished on each arm with a screw, which acts as a weight: that which is attached to one arm is parallel to the magnetic axis of the bar, and by moving it forwards or backwards the bar is made to assume a horizontal position: the other is in a vertical position, or at right angles to the magnetic axis; and by moving it upwards or downwards the centre of gravity is made to coincide with the knife-edge. The whole apparatus is capable of being turned on a vertical axis, so that the bar may be placed in any azimuth with respect to the magnetic meridian.

In some constructions of the instrument there is attached to each extremity of the bar a ring of copper carrying two wires at right angles to one another; a line joining the intersections of the pairs of wires should be parallel to the magnetic axis of the bar, and the deviation, if any there be, is determined by observing the intersections on a scale in a microscope, which is fixed on a support near each extremity of the bar; the latter, while at right angles to the magnetic meridian, being for this purpose placed successively in a direct and a reversed position. Half the difference between the readings on the scale is the value of the error.

In order to put the magnetized bar in any required position, a brass bar of the same dimensions as the other, and like it provided with knife-edges, is made to rest on the agate planes, and is brought to the magnetic meridian by means of a magnetized needle which turns on a pivot at the top of the bar. A, theodolite, is fixed on the base of the instrument, and the telescope is turned till the crossing of wires in the field of view bisects a distant object; the telescope is then turned horizontally through an angle equal to the required azimuth in which the magnetized bar is to be placed, but in a contrary direction, and lastly the stand carrying the whole apparatus is turned round horizontally till the telescope wires again bisect the object. The bar will then be situated in the required azimuth.

When the variations of the vertical intensity of terrestrial magnetism are to be observed, the interval between a fixed wire in the microscope and the apparent place of the instrument is measured by means of the moveable wire in the former; the deviation is read on a scale provided for the purpose, and is expressed by a circular arc in terms of the radius. The formula for determining the variation between the absolute vertical force of magnetism and its variation is

\[
dF' \frac{F'}{F} = \frac{n_R}{(R^2 - n)M} \cotan \theta d\phi,
\]

in which $F'$ represents the vertical intensity, $dF'$ its variation, $\theta$ and $\theta'$ are the times in which the needle would perform a vibration in a vertical plane respectively, $\theta$ is the inclination (commonly called the dip), and $d\phi$ is the observed deviation of the bar from a horizontal position at the Greenwich Observatory the vertical force magnetometer is provided with a mirror, which stands over its centre of motion with its plane oblique to the magnetic axis.
of the bar. A scale is affixed to the opposite wall of the apartment, and the mirror reflects it to the eye of the observer, who, looking through a telescope, reads the division of the scale which appears in coincidence with the wire in the field. A building containing the magnetic instruments at Greenwich is in the form of a cross on the plan; two of the walls are parallel, and the two others perpendicular to the magnetic meridian. The declination magnetometer is in the south arm, the horizon magnetometer in the east, horizontal magnetic needle in the west arm of the building; both of these bars are perpendicular to the magnetic meridian. Three telescopes are placed in such situations that their aim may be directed to the needle, one to another, and thus make his observations on the three magnetometers nearly at the same time.

MAGNOLIA, a genus of plants named in honour of Pierre Magnol, who was professor of medicine and prefect of the botanic garden of Montpellier. He was born in 1638, and died 1716. He gave an account of the plants growing wild about Montpellier, in a work entitled 'Botanicon Magneliense.' The genus Magnolia has the appearance of a tree, but it is more of a shrub, with alternate, deciduous, or evergreen simple leaves, and large terminal solitary odoriferous flowers. They are all natives of North America and Asia.

A native of South Carolina Magnolia, or Laurel Bay, is an evergreen tree, reaching sometimes a height of 70 feet. It has oval-oblong coriaceous leaves with the upper surface shining and the under surface rusty; the flowers erect, with from 6 to 9 petals expanding. This plant is one of the tallest and hardiest trees of North America. It has large pale-green shining leaves nearly 10 inches long, with large white flowers. It has been cultivated in England for the last century, and in this country attains a height of from 20 to 30 feet. Several varieties of this species have been named and described. Among the most constant and best known varieties are, 1. M. lutea; 2. M. E. M. magnica; 3. M. globifera; 4. M. Rhombifolia; 5. M. Carolinae by the name of the Big Laurel; the second is the Exmouth Magnolia; the third and fourth are varieties which have been bred from the Mugho endemic. In the cultivation of this species a deep sandy loam, dry at bottom, and supplied with vegetable mould, suits all the varieties. In planting it against a wall, almost any aspect may be chosen except a north-east. This plant may be propagated by stools, which should be laid down in autumn, and require two years before they are fitted for separation. They are then potted, and kept in pits under glass during the winter. It may be also propagated from seeds from America and Asia. M. chrysantha, deciduous Swamp Magnolia, is an almost deciduous plant, with obtuse elliptical leaves, glaucous on the under surface; the flowers from 9-12 petalled, contracted; the petals from 1 inch to 2 inches long, from 15 to 20 feet in height. It is a native of North America, in low moist swampy ground at a little distance from the sea, from Massachusetts to Florida and Louisiana. This plant is also common to Asia and Japan. The bark has a bitter and aromatic odour resembling sassafras. On this account it has been used in America as a substitute for the aromatic bitter barks as Cascara, Canella, etc., and in the Antilles. The flowers from July, 1808, are very fragrant. The flower is used in Asia and Europe, very favourable reports of its efficacy in chronic rheumatism, ague, and remittent fever have been given. All the species of Magnolia possess more or less the properties which are useful for the abolition of the new form of scurvy. The shrub known in America as the bear, seeds, or cones, is equally efficacious. It is said that when the tincture is made from the leaves and cones whilst green, it is more efficacious. In America this tree is known by the names White Laurel, Swamp Laurel, Swamp Sassafras, Sweet Bay, and Beaver-tree. The last name is given to it on account of the fondness of the beaver for it. The flowers are of a cream colour and have a sweet scent, which Kazanek says be sufficient at 60 miles. The flowers are followed by red berries, which give the tree a handsome appearance. The berries are studded in brady and used as a domestic medicine for various complaints.

M. umbrella is a deciduous tree with lanceolate spreading leaves, the adult ones smooth, the younger ones pubescent underneath; the petals 9-12, exterior ones pendent. It is a native of North Carolina, in the Carolinas, in Virginia, and New York. The leaves are 1 to 2 feet long, placed at the ends of the branches in a circular manner, and the form of an umbrella, from which circumstance it has been called the Umbrella-tree. The wood is soft and spongy, and on the mountains of Virginia is called Elmwood.

M. acuminata, a deciduous tree with oval acuminate leaves, the under surface pubescent, the flowers with 6 to 9 petals. It is a native of North America, from Pennsylvania to the Carolinas. The flowers are large, 3 or 4 inches in diameter, of a yellowish colour, mixed with faint blue or pale green, but not remarkable for their beauty. The fruit is about three inches long, and contains 1 seed, and is called the Umbrella-tree. A tincture is made of the fruit, and is used in cases of rheumatism. Several varieties of this plant have been described. It is often used in the London nurseries as a stock on which to engrat the other species.

There are several other species of this magnificent genus found in the forests of North America, all of which are valued in Great Britain for ornamental culture. The best known of these are M. cordata, the heart-leaved Cucumber-tree, with yellow flowers streaked with red, and having a disagreeable odour; and M. curculota, Indian Fishtree, or long-leaved Cucumber-tree, has white flowers, and is a bitter bark, which is used as a medicine by the Indians.

M. Yulan, or conspicua, a deciduous tree with obovate abruptly acuminate leaves, the younger ones pungent, expanding after the flowers, the flowers coniferous appearing before the leaves. It is not quite so hardy as the American species; still, unless the weather is unpropitious, it will put forth an abundance of blossoms during the drizzly months of February and March. M. purpurascens, the purple-leaved Magnolia, is a deciduous shrub, with obovate acutately-veined leaves, almost smooth; the flowers erect, of 3 sepals and 6 obovate petals; the styles very short. This plant is a native of Japan, and seldom attains a greater height than 10 feet. The flowers, when bruised, have a very aromatic odour. The flowers are more or less purple without, and always white within. It is a very ornamental species and worthy of cultivation. The best situation for it is against a wall, where its branches will reach from 15 to 20 feet.

In their cultivation the hardy kinds may be treated in the same way as M. grandiflora. The Chinese kinds are often inarched or budded on M. obusaria. When the plants are replanted after layering or propagation by seed, neither the roots nor leaves ought to be cut off, otherwise they will not succeed so well. (Don, Gardener's Dictionary: London, Encyclopædia of Trees and Shrubs.)

MAHADEVYA. [SYTA, P.C.]

MAHAMD. [SITA, P.C.]

The younger son of Sultan Abdu-ul-Hamid, Ahmed IV, was born on the 14th of Ramazan, a.h. 1199 (the 20th of July, A.D. 1785), and succeeded his elder brother, Sultan Mustafa IV, on the 28th of July, 1808. It is said that Sultan Selim, the uncle of Mahomed, was deposed and imprisoned in 1807 on account of his civil and military reforms, and that Mustafa had no sooner succeeded him than he brought against the Sultan Selim the Nizam Jeed, or body of troops who were disaffected on European principles. Mustafa Raimkar, prash of Resjuk, V., 1. 2 I.
an old friend of the deposed Selim, strongly objected to the policy of Sultan Mustafa, and no notice being taken of his remonstrances, put himself at the head of his troops, marched upon Constantinople, occupied the town, and proclaimed Selim II. Selim II, the son of Solyman the Magnificent, was murdered. After a bloody struggle, and after having confined Sultan Mustafa in the same prison in which Selim was murdered, he proclaimed Mahmud, who was found in a room hid under carpets and books, and his majesty to believe that he was going to be murdered than to be placed on the throne of Osman. Hitherto Mahmud had spent his days in the quiet confinement of the seraglio, chiefly occupied with Turkish and Persian literature, and enjoying, during the last twelve months previous to his accession, the instruction of the captive Selim, who, it is said, foretold his nephew's future elevation, and initiated him in those principles of reform through which he had endeavored, though in vain, to reorganise Turkey. Mahmud was also imbued with that deep hatred of the Janissaries which was one of the leading principles of his future actions.

Mahmud ascended the throne when Turkey was in a violent political and social crisis. In consequence of the enlightened and weak government of Selim the prejudices of the people were roused without meeting with a power sufficient to check them, and the nation was disorganized by the pashas of Europe, Asia, and Africa; and the Janissaries, who were exasperated through Selim's attempts upon their privileges, were ready instruments in the hands of those agitators. The pretext of elevating the murmurs of Selim, or the deposition of Mustafa, were, at first secretly, then openly, sowing the seeds of discord. In spite of this threatening state of the empire, Sultan Mahmud boldly proclaimed that he would carry out the will of Selim, and in choosing Mustafa Bairakzar his grand vizir, he proved that he was not using idle words. Several pashas who were severely punished for disobedience were the first to perceive that their protector was to be given to the more energetic than Selim. When the turn of the Janissaries came, they broke out in open rebellion, and besieged Mustafa Bairakzar, whom they believed to the originator of the reforms, in his fortified palace. Unable to hold out longer, and receiving no relief from the sultan, who was himself assailed by the rebels, the gallant vizir blew himself up. Mustafa was proclaimed sultan, and the rebels cried out for the head of Mahmud. In this critical position Mahmud did a deed at which humanity shudders, but which was one of the boldest political strokes ever attempted by a Turkish sultan: he ordered his captive brother to be strangled together with his infant son; and though twenty-five thousand were preserved, one in four, were sewn up in leathern sacks, and drowned in the Bosporus. By these murders Mahmud became the only male descendant of Osman.

His greatvizir, or grand vizier. Yet he had none other thought than the glory of Turkey, and he made its existence depend upon his own, for with the death of the last of the house of Osman, the empire of Osman would have become a prey to anarchy. The very fact, however, of his being the only descendant of Osman, was a sort of guarantee for his life, for although the people had massacred more than one sultan, and the sultans themselves had shed the blood of more than a hundred royal princes, these crimes were committed against individuals and not against the reigning family, the popular belief being that Turkey would last no longer than the family by whose great ancestor the empire was founded. Mahmud was fully aware of this when he sacrificed his brother and his brother's children, and we may fairly presume that his object was to make himself the only representative of the founder's family.

Mahmud succeeded in crushing this bloody rebellion after a struggle of two days, and having conciliated the Janissaries by abolishing the Nizam Jedid and establishing his authority at home, he turned his attention to his relations with the European powers. In 1812, France and Russia were at war. The Turks were defeated; Constantinople was in danger; the principal pashas in Asia, Africa, and Europe threatened a revolt or had revolted; and Czerny George raised the standard of independence in Servia. Mahmud, although pressed to make peace, persisted in continuing war, and he was encouraged to do so by French diplomacy, for a war between France and Russia was imminent. That war broke out in 1812, and Constantinople became the centre of European intrigue, Russia and Great Britain being active in making peace acceptable to the sultan, while Napoleon made the greatest efforts to dissuade him from any agreement. But the Russians had conquered Northern Turkey as far as the Danube, Mahmud could fairly hope that the Russian army would soon be compelled to evacuate the Turkish territory. He and would perhaps have continued the struggle, but for the strong remonstrances of England, which were backed by a large fleet in the Mediterranean. Under those circumstances he made peace with Russia at Bukarest, on the 26th of May, 1812, on conditions which were too unsatisfactory to him than the unfortunate turn of the war allowed him to expect. He lost only that part of Moldavia which lies east of the Pruth, which now became the frontier of the two empires, and a few districts in the Caucuses; while the Servians, abandoned by Russia, were obliged to submit once more to the Turkish yoke. Mahmud would perhaps never have waged war with Russia, but for the certainty that Napoleon had abandoned him, by a secret article of the treaty of Tilsit, to the Emperor Alexander, and the exorbitant demands which Russia made upon him in consequence of the Czar's friendship with Napoleon. The Russian army thus disengaged immediately set out to cut off the remains of the Ottoman forces from Morocco by the news of the peace of Bukarest, for he had been outwitted by a prince whom he used to call an ignorant barbarian.

Mahmud availed himself of the peace to continue the work of reform. He reversed the policy of his uncle, restored the friends Berber Bashi and Khalet Efendi. He succeeded in keeping down the rebellions spirit of the pashas of Baghdad, Damascus, Widdin, and Silistria; and he received good news from Morroco, where General Boudier, from Meknes and in charge of the conquest of Mocca from the Wahabis who had seized it. His attention was chiefly directed to Ali Pasha of Janina, whom he watched with great suspicion, being convinced that sooner or later that great feudalist would rebel against him. His conduct towards Ali Pasha was signaled by that mixture of craft and frankness which so strikingly in the character of eastern nations; and while he deprived the sons and grandsons of the Janissaries of their offices, and confiscated their estates, he still professed to be a friend of Ali himself, till the moment came for ensnaring and crushing him. The downfall and death of Ali Pasha, in 1822, seemed to promise a harvest of future success to the sultan. But Turkey's enemies were like the hydra; the more heads fell the more ones rose; and no sooner was Ali's head exposed on the gate of the seraglio, than Mahmud had to prepare for a contest with Russia, a deadly struggle with Mahmud 'Ali of Egypt, and an open rebellion of the Greeks.

The Greek rebellion first the attempts of Alexander Yasponti in Wallachia, and of the Greeks of Constanti
tinople, who, with the help of the Greeks of Morroco, cost a fleet, were easily frustrated; but the insurrection in Greece compelled the sultan to make the greatest efforts. Unable to quell the rebellion with the forces under his immediate command, Mahmud divested Mehemet Ali of Egypt of his power and sent him to be governor of the Greeks. Mahmud went upon crusading all rebellion within his dominions, and making himself equally respected by both his Turkish and Christian subjects, declined all interference, and the three powers entered into an alliance by the convention of the 7th of July, 1827. They proposed that Greece should be a vassal state of Turkey, and should acknowledge the sultan's suzerainty by paying an annual tribute. The Greeks protested to submit on that condition, but the three powers went on with their proposition with disdain. Upon this the combined British, French, and Russian fleets attacked the Turkish-Egyptian fleet in the bay of Navarino (30th of October, 1827), and the allies of the East, with the pride of Turkey and her fleet, which had just broken out. The Turks were defeated; Constantinople was in danger; the principal pashas in Asia, Africa, and Europe threatened a revolt or had revolted; and Czerny George raised the standard of independence in Servia. Mahmud, although pressed to make peace, persisted in continuing war, and he was encouraged to do so by French diplomacy, for a war be-
holy war" against Russia, well-knowing that the insurrection in Greece was in a great measure the work of the Czar. Before, however, we proceeded to the Russian war, it is necessary to speak of the destruction of the Janissaries.

Mahmud accomplished this the greatest of his measures at a time when the disturbances that fell from the clouds of his new dream were about to be absorbed by the interference of the three powers in the Greek insurrection. At this time he proceeded openly with his reforms as to leave no doubt of his firm intention to overthrow the system of the Janissaries, that majestic pile of laws upon which the state of things. He had musical and theatrical entertainments performed in the seraglio; he dressed after the fashion of Europe, and abandoned the sacred turban for the fez; and, to the astonishment of hiswife and family, he openly formed an alliance with another Nizam Jefid, or Azaír Mahammediyeh, as he now chose to call these troops. When he signed that order he had like- wise resolved to destroy the Janissaries, who did not allow him to wait for an occasion to begin the contest. On the 15th of June, 1828, the sultan and the grand vizier being then in the country, a strong body of Janissaries, reinforced by a crowd of the worst characters, met at their great barracks the Et-Medîán, and thence marched in battle array to the palace of the grand vizier, which they took and burnt after a bloody resistance on the part of the domestics, who were cut to pieces in the streets, and the people of the place, who were encamped in some subterranean vaults in the garden. The grand vizier hastened to Constantinople as soon as he had heard of the riots, informed the absent sultan of the event, assembled the dispised Janissaries, and himself composed the force that he could dispose of. The shouts of "Down with the Nizam Jefid! we will have the heads of all those who advised the sultan to introduce new institutions!" soon reached the ears of the sultan. A white Khatshé, or the messenger of the seraglio. Thitther Crawford the "ulema and the students, the marines, the sappers, and the officers of the artillery with their guns, all ready to shed their blood for the sultan and his reforms. Encouraged by the presence of so many adherents, the grand vizier sent an answer to the rioters, that he would not satisfy their demands, but would repel force by force. The Janissaries were prepared for war and resolved to attack the besieged army in a small boat from his country-seat at Beshik Tash, on the Asiatic side of the Bosporus. Fully aware of his danger, he harangued his troops, and declared that he would put himself at their head and attack the rebels, but having been dissuaded from this resolution he sent the grand vizier with a body of troops to the mosque of Sultan Ahmed, which was to be the chief meeting-place of the sultan's party, and contented himself with encouraging his men from a look on one of the outer walls of the seraglio. On his order the muti unfolded the "sinjak sheri," or the standard of the prophet, and hundreds of "chakhs," or criers, dispersed themselves throughout the city. The Janissaries, in their foremost detachments, set out to rally round the holy standard, and to defend the throne and their religion against a mob of impious rebels. An immense crowd soon gathered round the seraglio, and marched towards the field of battle near the attendant pieces the detachments which the Janissaries had placed in all the streets leading to that mosque, for the purpose of isolating the grand vizier. At the sight of the holy standard the Janissaries concentrated their forces in the square, around the Et-Medîán, and threw up entrenchments. Husein Pasha, Ibrahim Pasha, and Mohammed Pasha, whom summoned them by order of the sultan, to lay down their arms, were received with a terrible yell and narrowly escaped assassination. They were strong enough, they said, to defend themselves till the evening, and the coming night would bring decisive results in the morning. Two thousand houses in the town would throw light upon their path! The muti now read with a loud voice the first chapter of the Koran, the "Al-Fâtihat," the shortest chapter of the Koran, which is held in as high estimation by the Turks as the Lord's Prayer by the Christians, and is considered to contain the quintessence of the whole Koran. The words run thus:—

'Praise be to God, the Lord of all creatures; the most merciful, the giver of recompence, in such a manner that none can equal him, and of those do we beg assistance. Direct us in the right way, in the way of those to whom thou hast been gracious; not of those against whom thou art incensed, nor of those who go astray; lead us not into temptation, but make us strong against the centre of the hippodrome for more than two thousand years. Six thousand Janissaries perished in the course of one day; several hundreds who had not taken part in the action, but were known to be reformers, were either thrown from their houses, and 15,000, who had kept quiet, were exiled to different places in Asia Minor. On the following day, the 16th of June, a battle sheriff pronounced the abolition of the military corporation of the Janissaries, after it had been the bulwark of Turkey during five centuries from the time of its foundation by 'Ali-ed-din, the vizir of Sultan Urkhan. Thus Mahmud crushed his most dread enemy at home, only four years after he had been compelled to sacrifice to the fury of the Janissaries his favourites Berber Bashi, the muti, and his favourite wife.

Although Mahmud was sufficiently provoked by the Emperor Nicholas to take up arms against him, his declaration of war, in 1828, was a rash act. Mahmud thought that his army, being now organised after the European system, would behave as well as that of any other nation, and that it might be taken, and paid dearly for learning that it is easier to create a name than a thing. We shall not dwell upon the particulars of the Russian campaign. After an indifferent struggle in 1829, the Russians, under the command of General D'Inglefield, made astonishing progress in 1829, in Europe as well as in Asia; and after the victory obtained by Diebitsch over the grand vizier Josuè Pasha at Shumal, in the eastern Balkan, and the capture of Esz-Rim by Paskiewicz, Constantinople would have been lost, and the Turkish empire would have fallen a prey to the Russians, but for the interference of the great European powers, headed by England, through whose mediation the war was terminated by the Treaty of Paris, on 14th of September, 1829. This was the most disastrous war that was ever undertaken by the Turks, although their loss of territory was comparatively trifling, and far less than the loss of Hungary and Servia after the peace of Karlowitz and Passarowicz with Austria. Mahmud's direct loss was only a small tract on the Caucasian frontier. But Greece was now definitely separated from Turkey; the suzerainty of the Sultan over Moldavia and Wallachia was reduced to a shadow, and the Russian emperor acquired that sovereignty over the two principalities, which was formerly possessed by the Turks; Servia was acknowledged as an independent state, though tributary to Turkey; and the Black Sea was thrown open to the ships of all nations. The Black Sea to the Mediterranean, and an effective protector- ship over the Greek church throughout all Turkey; and the sultan at last was required to pay the expenses of the war, a sum so heavy that the Sultan felt constrained to solicit the remittance of about one-third of it. The circunstances most humbling for the pride of the sultan was that he obtained that peace through the mediation of the European powers.

During the years subsequent to the peace of Adrianople, Mahmud, with unabated perseverance, was active in creating a new army and navy, and in improving his ruined finances. He wanted both men and money to check the increasing power of Mehmed 'Ali, whom he watched with hate and suspicion. A conspiracy detected at Constantinople to depose the sultan, was attributed to the intrigues of the Greeks of Egypt, and increased Mahmud's hatred: to reward those who had proved most loyal under such trying circumstances he formed a new order, the Nischia Ischluss. In 1831 hostilities were commenced with Mehmed 'Ali, Ibrahim Pasha, who had made a raid against the Pasha of Damascus and conquered Syria; but there was not open war till 1832, on Mehmed 'Ali's refusal to withdraw his troops from Syria. The declaration of war took place on the 11th of March, 1832. When Ibrahim defeated the Turks at Hems; and on the 21st of December he obtained the splendid victory of Koniah, in consequence of which the Turkish army was disbandeled, and the Egyptians advanced to the very gates of Rhodes. The assembly had now to decide whether the European powers should enforce a truce; but in spite of it Ibrahim pushed on and occupied Brussa. The ruin of the sultan seemed to be inevitable. He was saved by his greatest
enemy: a Russian fleet appeared off the Bosporus, and opposite Constantinople landed a strong body of Russians, commanded by General Lazarev, whose arrival stopped the progress of Ibrahim. On the 4th of May peace was concluded at Koniah, and Mehemmed Ali obtained the object of his arms, the surrender of Smyrna and Adana; but he remained a tributary vassal of the Porte. So much was Turkey weakened through this war, that Mahmud, despairing of further independence, threw himself into the hands of Russia, and on the 8th of July signed the treaty of Uzak-Kaleiski, by which Russia bound herself to assist Turkey with an army whenever she should want it, in acknowledgment of which Mahmud promised to repair a hitherto armed ship of foreign nations should be allowed to pass the Dardanelles without the permission of Russia. Mahmud was more fortunate in an expedition against Tripoli, which was brought back under the sultan's immediate authority, and at Tunis also he succeeded in obtaining obedience to his orders.

Mehmed's hatred of Mehmed 'Ali became now the principal motive of his actions. As early as 1834 things were so bad, that Mahmud not only resolved upon a fresh war, but put himself at the head of his troops in order to conduct it in person. But in crossing the Bosporus he dropped the sacred sword of Soliman II., which fell into the sea and was lost for ever, and this put an end to his hopes of ever returning to Constantinople. War was prevented by the mediation of England, France, and Russia, but the sultan nevertheless continued preparing for a contest which he wished, and which his subjects dreaded. The contents of the letter, which he bestowed upon his military preparations was surprising. Yet the result did not answer his expectations. He thought that because he had a system of order on paper, the administration was as well as in Europe; and he forgot that the execution of his orders was to be intrusted to persons who themselves had first to learn obedience and impartiality. In his first war with Mehmed 'Ali he was the victim of the knavish tricks of some of his men, especially of the old Khoisrov Pasha, without ever suspecting how unfairly he had been dealt with. Sufficient money was intrusted to Khoisrov to defray the expenses of the war, and the strictest orders were given as well as in Europe; but when the end of the campaign, Husein returned to Constantinople, he did not dare to complain of the peculation of the powerful minister. Reshid Pasha, another commander, received the most solemn orders to provide military stores, and for three years was paid for the army, in the different towns of that part of Asias Minor where he was to command, but when he came to Ak-Shehr, his men found that the best chance of getting a dinner was in the Pasha's house. The second war with Mehmed 'Ali would perhaps have broken out so soon (1840), but for the pasha's manifest design to subject all Arabia to his authority; and it is said that the sultan was urged by Russia, and especially by Great Britain, to open the campaign in that year, although he knew that his army was not yet able to take the field with any chance of success.

On the 29th of June, the Turkish army under Hafiz Pasha was entirely defeated by Ibrahim Pasha, near Niabis; and there being no other army to oppose his victorious career, it was evident that Turkey was lost if the European powers did not interfere. Mahmud was fortunately not destined to hear of the disgrace of his arms. He died on the 1st of July, 1840, a few days before the news of the battle of Niabis reached the seraglio. The Sultan Mahmud I. was a man of many parts. He was not a soldier but a negociant. He understood commerce, and he knew that the first step in his policy was to increase the business in wine. Two German physicians, under whose care he was, declared his ailment to be tubercular phthisis; shortly before his death they were dismissed, and, as the younger Michael in the "Biographie Universelle," says, were superseded by an English quack, through whose efforts the sultan died; two months before his death could have been expected to take place according to the nature of his disease. Mahmud was succeeded by his eldest son, Mejid, the present sultan.

Sultan Mahmud II. was a handsome man, of majestic appearance. He was always active, and at no period of his life did he abandon himself to those sensual pleasures of which so many of his predecessors were subjects. He rose before daybreak to be ready to say his prayers the moment the sun was above the horizon; after prayer he used to work six hours or more, according to the state of business; he never made his toilet after dinner; and visited the places, the docks, or the barracks. He always tasted the soldiers' dinner, rewarded the cooks when it was good, and punished them when it was bad. The soldiers called his children and many of them loved him as a father. For a Turk Mahmud possessed considerable knowledge; his handwriting was beautiful, an accomplishment which contributed much to his popularity among the learned, for the sultan is supposed to surpass his subjects in penmanship. He was an excellent father and loved his wives tenderly: on his death-bed he ordered his son 'Abdul-Mejid to come to his side, and he entreated him never to abandon the path of reform. Yet he was only half civilized, as a Turk was then considered. He was conscious of the inferiority of a Turk with all the artfulness of modern diplomacy. His knavish tricks against 'Ali Pasha of Janina and Prince Milosh of Servia are well known. He could be cruel in cold blood; he murdered his eldest son. He was as cruel as Constantine Moralli, at the murder of the patriarch Gregory, and the violent death of many others who had incurred his hatred. For the details of his reforms we refer the reader to Turker, C. O., p. 145, and to the works of some of the most remarkable men of his age, and one of the greatest sultans of Turkey. He may be compared with Peter the Great, and like him he was idolized by one portion of his subjects and hated by another. As a Minor he was the old school called him a heretic (philoser), and accused him of attempting to destroy the religion of Mohammed and to introduce the Christian faith, a calumny which grieved him very much, for he was a great lover of books and had made a law of prohibition of wine. If Mahmud was less successful than Peter the Great, it must partly be attributed to the circumstance that the Russian Czar ruled over one nation professing one religion, his Mohammedans being proportionally too few in number to offer any serious resistance; Mahmud ruled over seven nations, Turks, Wallachians, Albanians, Greeks, Slavonians, Armenians, and Arabs, some of them Mohammedans, others Christians of various creeds, and all of them detesting each other. Among these the ruling nation, the Turks, form the great minority in European Turkey, and in Asia Minor are less numerous than the Greeks and Armenians together. The infection of the Turks is almost exclusively Arab. We conclude this sketch by an extract from the Turkish historiographer Asa Efendi, quoted by Michaud in the source mentioned above, who gives the following portrait of Sultan Mahmud II.

' Mahmud is terrible like Alexander. The slightest menacing cast of his countenance would check 100,000 rebels; and his awful frowning crushes the impious followers of Shredda who dare to take up arms against him. Such is his power, and such the soundness of his genius, that he silences the most subtle metaphysicians and rhetoricians, strikes them with astonishment, and compels them to lower their heads before his superiority. There is not his equal among the weakest of the kings, for, as the poet says, 'He presides equally over the warriors, the learned, and the charitable, by his exploits, his speeches, and the demonstrations of his merit, his handwriting is of extraordinary beauty; the points (diacritical) are like so many fixed stars; and it is worthy to be hung up under the vault of heaven near the girdle of the angels.'
he great no other limits to our sultan's success and years than those of numbers, namely infinity.'

(Sultan Mahmud and Mahmud 'Ali Pasha, by the author of 'France, Russia, and Turkey,' 3rd edition, London, 1835; Von Hammer, Des Osmanischen Reiches Staats-Verfassung und Verwaltung in der 18. und 19. Thausendjahrhundert, 1818; MAIA,'NIO, BENEDETTO DA, a celebrated Italian sculptor and architect, was born at Florence, in 1444. He first distinguished himself as a carver and inlayer of wood, and was occupied in the decoration of the Cappella del Transito of S. Spirito in his time. He executed some very extraordinary inlaid-work for cabinets for the kings of Naples and Hungary, and an accident which happened to two which he made for the latter king caused Malvasia to give up the art of inlaying in disgust. These two chests or cabinets suffered so much in the transport from Florence to Hungary by undue care or the change of climate, that when they were uncovered by Benedetto before the king, a great part of the inlaid-work, owing to the effect of the moisture on the glue, fell to pieces, to the great dismay of the king and the horror of the artist, and had to be remade. Benedetto felt that an art in the works which were subject to destruction by the will of others was unworthy the attention of superior abilities, and he thenceforth applied himself exclusively to sculpture in marble and to architecture.

Benedetto's marble works however were also of an ornamental or decorative character. His statues, busts, and portrait paintings were of a more elaborate character, being loaded with beautifully executed small figures, besides other decorations. One of his master-pieces is the justice bench at the Ducal palace at Mantua. His statues represent the life of San Francesco, and the establishment of his order, in five compartments; with the figures also of Faith, Hope, Charity, Fortitude, and Justice. The bench was beautifully executed by Giambologna, and was published with letter-press description in 1585—Il Pergamo scolpito in marmo da Benedetto, da Maiano nella Chiesa di Santa Croce in Firenze. Benedetto also made the crucifix above the altar of S. Maria del Popolo in Florence; he finished the Magdalen in Santa Trinita, which was left imperfect by Desiderio da Satignano. In architecture he did very little: he built the portico of the church of the Madonna delle Grazie near Arezzo; a chapel for himself on his own estate near Prato; and he is said to have designed the Palazzo Strozzi. He died rich in 1495, aged only fifty-four, and was buried in San Lorenzo at Florence. He left the reversion of his property to the brotherhood of the Bigallo.

GIULIANO DI NARDO DA MAIANO, the uncle of Benedetto, was likewise a distinguished artist, and in similar works. He was the first to introduce the new styles and charges in Florence, in Pisa, in Loreto, in Naples, and in Rome. He succeeded Brunelleschi as the architect of the cathedral of Florence in 1446. At Naples he built the palace of Poggio Reale, which now forms the centre of the extent of the city, and the triumphal arch, and the reliefs of the Castello Nuovo (now the Arsenal). At Rome he built of Travertine stone the loggie of one of the courts of the Vatican; and the church and palace of San Marco for Pope Paul II. in the same material; and a report was long in circulation that part of the Colosseum was pulled down for the stones, more charitable persons have presumed that the pope used only such stones as had already fallen. Giuliano commenced also, in 1446, a new nave to the church of the Madonna at Loreto, which was completed by his nephew Benedetto. Giuliano was still living in Florence in 1471, a fact clearly ascertained by Boccaccio, an inhabitant of my own city, in the reign of Alfonso I. (1435-1458), is erroneous; this statement is also evidently incorrect from the fact of Giuliano being employed by Paul II., who was pope from 1464 to 1471.

(Vasari, Vite de' Pittori, &c., and the Notes to the German translation by Schomb; Cicognara, Storia della Scultura; Humorke, Italianische Forschungen, 1852.)

MAINTENANCE, SEPARATE. [SETTLEMENT, P.C.]

MALATESTA, MALATESTI, Lords of Rimini, an historical family of Italy during the middle ages. Like many other great feudatories of Italy, they are said to have originally come from Germany. One of the name is mentioned in some chronicles as 'Vicario,' or Imperial Lieutenant of Rimini, under Otho III., A.D. 1002. It is not, however, until the second half of the thirteenth century that we find authentic records of this family as being at the head of the Guelph party in Rimini. Giovanni Malatesta, called 'il Zoppo,' or 'the lame,' married Francesca, daughter of Guido di Polenta, Lord of Ravenna. Paolo, brother of Giovanni, seduced her wife, and being caught in adultery with her, they were both put to death in the streets by the public. This tragic event forms the subject of one of the most beautiful episodes of Dante's 'Inferno.' After many vicissitudes, owing to the faction of those times, we find Galeotto Malatesta, in the early part of the fourteenth century, acknowledged by the Pope as Lord of Rimini, Pesaro, Fano, and other places in the Papal State. His descendants continued in possession of these territories, with interruptions, till the time of Clement VIII., in 1598, when Sigismondo Malatesta was deprived of his dominion by the Pope, and retired to Venice, after which several of the same family figured in the service of that republic. One Carlo Malatesta had already distinguished himself in the wars of the fifteenth century, between the Duke of Milan and the Venetians. (Sanavino, Famiglie Illustri d'Italia.)

MALAXIS, a genus of plants belonging to the natural order Orchideaceae, and to the tribe Malaxisideae. It has a patent petiole, the lip posterior, erect, entire, similar to the petals and smaller than the sepals; the spur absent; the flower in the axil of the leaf. It is a terrestrial herb, with a rotenoid terminal, continuous with the short column, out of the apex of which it appears as if it were excavated with two imperfect cells; the pollen-sac connected at their apex; the anther a spongy box, where it grows upon the moss, in the character of an epiphyte, and not amongst it as other bog-plants.

MALINGERING. [FRIEDRICH DISEASE, P.C. 8.]

 MALLOWS, JAMES HARRIS, FIRST EARL OF MALMESBURY, JAMES HARRIS, was the only son of James Harris, the learned author of 'Hermes,' and other well known works. His mother was Elizabeth, daughter of John Lake, of Lake, in the county of Somerset, Esq.; and he was born at Salisbury on the 21st of April, 1746, the day of the battle of Culloden. The Harris's had been settled on their estate of Orcastone St. George, in Wiltshire, since about the middle of the sixteenth century. The father of the subject of the present notice was the first of them who was ever in parliament or employed in any political capacity. He was considered as having belonged to the first class of the gentry in the county. The father of the author of 'Hermes' married a daughter of the second Earl of Shaftesbury. After having instructed him in the grammar-school of his native town, the subject of this notice was sent to Winchester, where he remained till September, 1762. His father, who was by this time in office, now kept him with him in London for some time, and the Earl sent him to Peterhouse College, Oxford. In a letter written in his advanced years he expresses himself as unable to decide whether his father did right or wrong in introducing him to society before he was sent to the university. 'I believe,' he says, 'the seeing many of the leading men in administration, hearing them converse on public business, contributed to form my mind to think on public affairs, and to give me interest in them which, probably, otherwise I might never have acquired; but the mixing at that age (seventeen), and raw from school, in all the gaiety and dissipation of London, filled my mind at the same time with false objects of admiration, false notions of excellence, and an rashness in my own deportment, which in the world so much greater than I supposed my fellow-collegians could possibly possess, that I apprehend I carried to the university a considerable share of self-sufficiency, and no great propensity to attend lectures or to obey college rules.' But although he professed to look back upon the years he passed at Merton as the most unprofitably spent of his life, he appears to have by no means altogether neglected study amid the then prevailing idleness and dissipation of the place. Even in his own disparaging account he admits that, although he never saw his tutor at any other time, he did receive his instructions for the hour before night, when he took it into his head to be taught trigonometry.

On leaving Oxford in 1765 he was sent for a year to study at Leyden; and here at least he seems to have made excellent use of his time, spending many hours daily among his
books, while he also mixed much in society. He then, after seeing eight months at home, set out in 1767 on a short confidential tour, in the course of which he visited Holland, France, and in the autumn of the same year he was, through the patronage of Lord Shelburne, his father’s colleague and friend, appointed secretary of embassy at Madrid, and thus entered public life at the age of one-and-twenty.

Three years after the affair of the Falkland Islands occurred, when he chanced to have been left at Madrid as chargé d’affaires, and, acting upon his own responsibility, he had the good fortune very luckily to bring to Parliament a document to concede the object in dispute. The Falkland Islands, the acknowledgment of our right to which was thus obtained from Spain, were given up by England four years after; but the temple and firmness, as well as talent, with which Harris had managed his successful negotiation, gave so much satisfaction to his government, that he was the following year appointed to the post of minister at the court of Berlin.

He retained this mission for four years, and then returning to England in 1776, married Harriet Mary, second daughter of Sir George Amysd Cornwell. In 1777 he was sent as ambassador to St. Petersburg, and, having, in the mean time, received the Order of the Bath in 1780, he remained in Russia till his health compelled him to return home in 1784. He had ever since 1770, notwithstanding his being abroad, held a seat in the House of Commons for Christchurch, and had, like most of Lord Shelburne’s friends and connections, attached himself to the party of Mr. Fox. When Fox, however, was now superseded in the direction of affairs by Pitt, Harris left his seat in Parliament and withdrew from the government. He was, however, in 1786, appointed minister at the Hague, to which he had intended that he should have been appointed if the Fox and North administration had remained in power; and he accepted it with the full approbation of Mr. Fox. While at the Hague he succeeded in negotiating, in April, 1788, the treaties of alliance with Holland and with Prussia, by which the power of the Stadtholder was at that time preserved from being overthrown by the democratic party, which had obtained in Austria and Holland, and threatened to grasp of France. For this great service, as it was considered, Sir James was, in September of the same year, raised to the peerage as Baron Malmsbury.

He now, after a short visit to Switzerland, returned to England. He continued to act with the Whig party in parliament till 1792, when he formed one of the large body of the friends of Mr. Fox, who went over the ministers with Burke and the Duke of Portland. Lord Malmsbury was now sent over by Mr. Pitt on a mission to Berlin, where he prevailed upon the new King of Prussia to enter into a second alliance with England and Holland, which however did not last for quite two years. In 1794 he was employed to negotiate the marriage between the Prince of Wales and Caroline, the daughter of the Duke of Brunswick; and, after having gone through a series of difficulties, Lord Holland, acting as Caroline’s proxy, accompanied her to England. His published Diary relates many curious particulars respecting this affair, the issue of which was hardly more unhappy than he had anticipated. In 1795 he was induced to direct his whole energies to the promotion of the colony of New Zealand, which he visited in 1796. He was elected a member of the House of Commons for Northampton, and was returned by the borough of Northampton till his death. He attended to his professional duties, preached regularly in his turn in the college chapel, and enjoyed the society of his former pupils. When, however, apparently in strong health, while on a visit to his father-in-law Mr. Eckersall, at Bath, where he died December 29, 1824. He left a widow and a son and daughter.

The attention of Mr. Malmsbury had from an early age been directed to political economy, in which he was much stimulated by his conversations with his father. The two most important of his works are, the ‘Essay on the Principle of Population,’ of which an edition was given in the article Population, P. C., and the ‘Inquiry into the Nature and Progress of Rent,’ the leading principles of which are stated in the article Rent, P. C.

When Lord Malmsbury visited Cambridge, Malmsbury displayed a great love of fighting for fighting’s sake, a keen perception of the ludicrous, much relish for wit and humour, and a considerable comic power of imitation; but his character gradually changed; he was serious and amongst his friends and men of the present earl, in 4 vols. 8vo., Lond. 1844; and which, besides throw much valuable illustration upon many of the events and transactions of the important period in which it was his fortune to live and act. The materials of the present article have been mostly abstracted from the Memoir prefixed to that publication.

(Memoir of Malthus, prefixed to the 'Principles of Political Economy,' 2nd edition, Pickering, London.)

MALUS, ETIENNE LOUIS, a distinguished philosopher and military engineer, was born at Paris, June 33rd, 1775. He received his first lessons under the eyes of his father, Anne Louis Malus of Mity; and, in early youth, his time appears to have been nearly equally divided between classical and mathematical studies. This judicious combination of the two great branches of education had the happiest effects, and formed the foundation of those developments of genius by which his name will descend to the remotest posterity. His memory was very retentive, and it is said that, even near the close of his life, he was able to repeat in a moment characteristic verses of considerable length. His taste for classical literature is shown by the fact that, when seventeen years of age, he had written a tragedy entitled 'The Death of Cato;' but subsequently his studies were almost exclusively of a scientific character.

At the time that the tragedy is said to have been written, young Malus was, after a strict examination, in which he acquitted himself to the satisfaction of the persons in authority, admitted as a pupil in the Ecole de Génie Militaire, it being the intention of his father that he should enter into that branch of the public service; and he is said to have immediately distinguished himself by his diligence and his scientific talents. From some cause, however, which is not explained, but probably because his father, who held the post of Treasurer of France, had become suspected by the government (the great revolution having commenced), he was dismissed from the Institution; and, either from poverty or compulsion, he entered the army as a private soldier. He was for a short time employed in that capacity, with the battalion to which he belonged, in repairing the fortifications of Dunkirk. But on the termination of the war, according to the government having decided upon the formation of the Ecole Polytechnique, inquiry was made for a certain number of officers for the exterior; but, as he was not yet approved of by the Government of the interior, might be the first to receive instruction in the higher branches of science; and it is recorded to the honour of M. Le Père, the commandant of the engineers at Dunkirk, that, knowing the great talents of the young soldier, he withdrew him immediately from the ranks and appointed him to Pariis, with a recommendation to the celebrated Monge. Malus was immediately admitted, and was joined, in a class, with about twenty other persons, to attend a course of instruction in mathematics, physics, and engineering, under the direction of Monge and his assistants. During three years he prosecuted his studies with extraordinary ardour, and distinguished himself by his applications of analysis to the solutions of some intricate propositions; he is said also to have occasioned an inquiry into our prospects respecting the future removal or mitigation of the evils which it occasions.

On quitting the Ecole Polytechnique, Malus was for a time employed as a professor of mathematics in the military school at Metz; but the small fortune which he possessed, his family having suffered great losses during the Revolution, and perhaps an inclination in favour of a more active life, induced him to abandon the project which he at one time entertained of devoting himself entirely to the sciences. He therefore entered into the service of engineers with the rank of captain; and, in 1797, he was sent to join the Army of the Sambre and Meuse. He accompanied that army across the Rhine, and was present at the actions of Ukranz and Alten-Kirch. The East Indies being then an object of ambition, he volunteered, with an Appeal to Facts in Refutation of the Charges lately brought against it in the Court of Proprietors.

When the Institute was founded in that city, he was appointed one of its members; and in the first volume of the 'Décade Egyptienne' there is an account of an excursion which he made far into the country, with his discovery of a branch of the Nile which had not before been noticed. Malus continued in Egypt till the remains of the French army capitulated, when, in 1801, he returned to his native country in an English vessel. Exhausted by the arduous services in which he had engaged, and being nearly ruined, he yet performed the duties of an officer of engineers, having, in 1804, been appointed by the government to superintend the construction of the works which were for the first time carried out in Egypt, and to be the title of sub-director of fortifications, and he was made a member of the Legion of Honour. Five years afterwards he was appointed superintendent of barracks in the department of the Seine; and in the following year, 1810, he was made a member of the Committee of Fortifications and Lieutenant-Colonel of Engineers.

Almost immediately on his return to France, Malus married a daughter of Koch, the Chancellor of the University of Giessen, to whom he became attached before his departure for Egypt; and, during the rest of his life, all the time he could spare from his professional avocations was spent in the cultivation of the sciences, particularly in the continuation of those optical investigations which he had commenced at the Ecole Polytechnique. His first published work was entitled 'Traité d’Optique,' in which, by the phenomena of the refraction and reflection of light as they have then been discovered, and by particularly distinguishing himself by his experiments and researches concerning the refraction of light in transparent media. It was then discovered that when a ray of light was entered into glass at a considerable angle of incidence, the internal reflection takes place either before it arrives at the posterior surface, or at a certain distance from that surface on the side from which the ray entered the glass; and it was determined, though an inequality in the angles of refraction in the two cases was manifest, to which of the cases either of the observed reflections should be referred. Malus overcame this
difficulty by applying successively to the surface an opaque medium, which, by preventing the reflexion of the emergent rays, proved that the observed reflexion had taken place where the transparent medium by which, by permitting the rays to pass quite through the glass, afforded a reflexion from the exterior of the latter.

The subject of double refraction in crystals was very impor-
tant. Some years ago, in 1808, the Academy of Sciences, in France
offered a premium for the best Memoire on the subject; and Malus immediately entered with ardour into this field of research. It was while prosecuting his experiments that he learned to him one of those fortunate incidents which only men of genius have the power of rendering available as steps to great discoveries. He then resided at Paris, and, happening one day to direct a prism of crystal which he held in the hand, towards the windows of the Luxembourg palace, on which there was a brilliant light produced by the reflected rays of the setting sun, he was surprised to find that, while turning the crystal round, one of the images produced by the double refraction in it varied in intensity, and alternately appeared and disappeared. As such phenomena had not been observed when the prism was directed to any other bright object, as the flame of a candle, Malus was for a time at a loss to divine the cause; but after making several observations on the light from the same windows, he ascertained that the effect was produced only when it fell on them at a particular angle of incidence, which he determined from the known position of the sun with respect to the surface of the building.

In the prosecution of the researches to which this interesting discovery gave rise, Malus found that when a pencil of light is reflected from a non-uniformly polished surface, the intensity of light varies with the angle of incidence equal to 54° 30', or from the surface of water at an angle of incidence equal to 52° 45', the reflected light possessed the same properties as were exhibited by one of the pencils produced by a prism in refraction in a crystal. He observed also that when the pencil reflected from a transparent medium, at a certain angle of incidence, is made to fall on another such medium at an equal incidence; if the planes of the second refraction coincide with those of the first, the light is reflected as usual; but if the planes are at right angles to one another, no reflection takes place at the second surface, the pencils of light being wholly refracted.

To the effect produced on light so reflected, Malus gave the name of polarization; conceiving that the particles of light have poles or axes, and that, on entering the doubly reflecting crystal, those forms in which one of the pencils may arrange themselves so as to be capable of being transmitted through it, while those which should have formed the other ray may have such dispositions as prevent the passage, in certain directions, from being effected.

It may be said to have laid the foundation of a new branch of physical optics; and an account of them is given in the Mémories de la Société d'Arcueil, as well as in the Mémories of the French Institute. Of this learned society, as immediately as it was instituted; and in 1811, though, on account of the war, there was scarcely any intercourse between Great Britain and France, the Royal Society of London awarded him the Rumford medal; thus performing a noble act of homage to scientific merit in the person of a foreigner, and one who carried arms among the enemies of the country.

In 1810 Malus published at Paris his Théorie de la Double Réfraction de la Lumière dans les Substances cristal- lisées; and in the following year he presented two papers to the Institute on some remarkable phenomena of polarized light. In the first of these it is shown that when a pencil, after being turned by refraction, falls on glass, part of it is reflected and part transmitted; the reflected part is wholly polarized in one direction, while the transmitted part consists of two portions, in one of which the particles preserve the character of direct light, and in the other the light is polarized in a direction contrary to that of the reflected pencil: it is added that the portion which has the character of direct light diminishes gradually by transmission through several planes of polarization, until it has disappeared; and the transmitted ray becomes polarized in a direction contrary to that of the reflected pencil. In the second paper it is shown that all polished bodies, opaque and transparent, polarize light by reflection, but the nature of the species which are polarized in one direction only. He observed the modifications which parts of organized bodies, whether animal or vegetable, produce on light when they are thin enough to be considered as translucent; and he pointed out how the coloured and multiplied images which are sometimes seen in Iceland spar. He described these images to the effects of figures parallel to the longer diagonal of the crystal rhombo- id; but David Brewster showed that they arise from veils which act upon the transmitted light at both of their surfaces.

During the short remainder of his life, Malus continued his scientific researches amidst all the duties which his post as a member of the Committee of Fortifications required. He was chosen Examiner in Physics and Descriptive Geometry at the Ecole Polytechnique; and though his health was fast declining, he neglected no occasion of performing the functions of that office. He was on the point of being made Director of the Studies in that Institution when he was removed by death from the scene of his useful labours.

He died in Paris, February 23rd, 1812, in the thirty-seventh year of his age; and his wife, who, ever since their union, had alleviated his labours by her attentions, and watched him in his last days with affectionate solicitude, survived him by nine years.

Malus enjoyed the esteem of the public for the qualities of his mind, and was beloved by all who knew him for the benevolence of his character.

(English translation at an angle; Biographie Universelle.)

MALVA (the Latin Malva), a genus of plants belonging to the natural order Malvacese. It has numerous styles, a double calyx, the outer one three-leaved, the inner one five-leaved. The capsules are triangular and many-celled; the cells one-seeded and circularly arranged.

M. Moschatia, the Musk Mallow, has an erect stem, kidney-shaped leaves, with five or seven deep pinnatifid lobes, the lower leaves in rosette with those in various parts of the plant, the fruit-stalks erect, and the fruit hairy. The flowers are large and rose-coloured, on axillary single-flowered peduncles, crowded at the extremity of the stem and branches. It is native in many parts of Europe, and is found in Britain in grassy borders of fields and by waysides.

M. sylystra, Common Mallow, has an erect stem, and is distinguished by its kidney-shaped leaves with seven deep crenate lobes; the fruit is glabrous, reticulate-rugose. The flowers are large and of a purple colour, much longer than the calyx, which is hairy. It grows on waste places and road sides in Britain, and is native in most parts of Europe. The whole plant is beset with abundant hairs. It is a honey flower, and is much visited by butterflies. In some cases it is propagated by semi-internal irradiation. Decorations of the leaves are employed in dyestry and in general for removing supposed scorim- isms, as it is said to have the power of drying up a wound, in which it is used in some cases of internal irritation. Decotions of the leaves are employed in dyestry and in general for removing supposed scorim- isms, as it is said to have the power of drying up a wound, in which it is used in some cases of internal irritation.

This species is the Malva of Pliny, lib. 20, cap. 21; also, in Columella, lib. 10, cap. 247: it is the polychy of Theophrastus, lib. 3, cap. 17, and the eronv polychy of Dioscorides, lib. 2, cap. 144.

M. rotundifolia, Dwarf Mallow, has a decumbent stem, roundish heart-shaped leaves with five shallow acutely crenate lobes, the outer sepals linear lanceolate shorter than the oval acuminate stellately hairy inner ones. The flowers are small and purple, and two or three times longer than the calyx. It is common in waste places in most parts of Europe, and is native of Britain. It is the M. vulgaris of Fries, the M. rotundifolia of Dioscorides, loc. cit., and the Malache styly a Flavus, loc. cit.

M. borealis has its outer sepals linear, as long as the ovo- acut glutinous, the stamens with a strong, ciliated peduncle. For once, the petals as long as the calyx, the fruit subpunctatus, margined, reticulate-rugose. It is the M. purifolia of Smith, the M. rotundifolia of Fries. It is found in Britain, near Hythe in Kent.

There are many other species of M. malva which occur in the whole of the Northern Hemispheres. Those which are the only natives of Britain, and the others are of little importance excepting as ornamental plants. Those best worth cultivation for this purpose are M. Moschatia, Mornica, ake, M. rotundifolia, and Fries, the Malache styly a Flavus, in any kind of rich soil, and cuttings of them will strike root freely if planted in light soil under-neath a handglass. The greenhouse species may be propagated in the same manner. The hardy perennial
should be planted in the open border, and may be propagated either by seed or by dividing the roots. 

(Don, Gardner’s Dictionary; Babington, Manual of British Botany.)

Mandate, as one of the contracts of the Roman law, was constituted where one by special agreement, or by tacit assent, had undertaken to perform some act gratuitously for another. The obligations incumbent on the mandatory, and entitled against him by law, does not, from his receiving a consideration for what he had undertaken to do, but from his leading the mandatory to believe that he would perform it, and thus causing damage if he should neglect it, is distinctly from himself. Gesner too, in some the person performing the service undertakes it without authority from the person for whose behoof it is undertaken; and from Locatio-

Candida, the service of which is not actually performed. The characteristics of Mandats of Mandate are briefly stated in Heineccius, Ad Inst., tit. 27, and by Gaius, iii. 155, &c. In England mandate in this simple sense is a department of the law of Bailment. (BAILMENT, P. C.) In Scotland there is a wide departure from the old Roman meaning of the word, and almost every instance where one person acts for another is said to be under the contract of mandate; thus the commercial agent buying and selling, and the solicitor conducting litigation, are said to be ‘Mandatories.’ The case in which, by the practice of the law of Scotland, the word mandate in its old sense is best exemplified, is in trusts, which, instead of being subject to the compulsory jurisdiction of the sheriff courts, are, in England, are treated as mere simple mandates. The acceptor of a bill is held to be a mandatory of the drawer.

Mandragora. (Arrone, P. C.) B. No. I. Mandragora is a woody, perennial plant, and its roots are a good remedy. During the prevalence of pneumatic medicine, preparations of mandragoras, particularly the brown oxide, on account of the large quantity of oxygen it can yield, were much employed; but since the views of Beddoes, who recommended them, have become obsolete, the articles suggested to be used have fallen into oblivion. A rational ground for reviving some of them is to be found in the facts that oxide of manganese exists as a constituent of these roots, and that similar effects are obtained in these structures, and also that carbonate of manganese exists in some of the mineral springs of Carlisle and Mien- laden, and hydrochlorate of manganese exists in the waters of Kreuznach. The presence of these salts in waters much celebrated for their utility in various chronic diseases has suggested their employment in some of the complaints which are frequently benefited by them. But even if their curative properties are insufficient to establish them as valuable medi- cines, the deleterious effects of some forms of manganese justify a notice of them in this place. The extensive em- ployment of black oxide of manganese, in the preparation of black paint, has occasioned the spreading of the fable of a man in a form of paralysis which should be early noticed, inasmuch as it is now thoroughly established it seems altogether incurable; and the only chance for escape from the occupation is to limit paralysis of the lower extremi- ties, affecting the motor nerves only, for the sensibility is unimpaired. A staggering gait is the first symptom of its commencement, which is observed about 1500; the body may be increased by giving it with infusion of senna or with rhubarb. Alkalies and their carbonates are incompatible with it, as decomposition occurs. Its power of augmenting the secretion of the bile, and the prostration of the gastric juice, or a substitute for it where mercury cannot be borne. It is useful in goit.

Mangl. (Calvotberg, P. C. S.; E. K. T. J. Gardiner, P. C.)

Mania. (Ismay, P. C.; Luctay, P. C.; P. C. S.)

Manning, Robert, is more usually called Robert de Brunne. He owes this name to his having been a Gil- bertine Friar in the monastery of Brune or Bourne in Lin- cobshire. He lived in the reigns of Edward I. and his successor, and was the writer of one of the earliest of the Metrical Chronicles whose language can be called English. His work however is merely a translation from the French. It is in two parts: the first, translated from the Breton 'A'ntegre' and ‘Roman ne le Roi’ of Wace and Gaimar, begins with 'Zeanas and ends with Cadwallader; the second, from Cadwallader to Edward L., is translated from the Chro- nicle of Peter Langtoft. (Langtoft, P. C.) Robert's version was published by Hearne in 1725. The measure of it is octosyllabic in the first part, and Alexandrine in the second. Its poetical merit is very small; but it is interesting as an early monument of the language and valuable for its information, both historical and literary. Robert made in English rhymes a translation, which has never been printed, of Saint Buonaventura's 'Petisio et Passiones Domini.' He translated also, freely, into octosyllabic verse, the 'Manuel Pache,' or 'Manual of Sins,' which used to be attributed to Bishop Groux on insufficent grounds. Of this unprinted translation specimen are given in Barton's work and elsewhere. Hearne has supposed, with little reason, that Robert de Brunne was the author of the old English metrical romance called 'Rycharde Coer-de-Lyon.'

Mantua, the name of a family of artists of Mantua, of the sixteenth century. The property name seems to have been Ghiasi, but few particulars regarding the lives of its members are known.

Giovanni Mantuan, also Bertano, was painter, sculptor, engraver, and architect, and a contributor of a commentary on Vitruvius—Gli occhi e difficili Pastel dell’Opera di Vitruvio,' fol., Mantua, 1558. He was also a pupil of Giovanni Battista Griezzi, and was very active in engravings, and a few paintings; but his chief business was architecture, and he built the church of Santa Barbara a Mantua. It is not known what relationship he bore to the following artists.

Giorgio Griezzi, called Giorgio Mantuan, was born about 1520. He was painter, and engraver, and was still living in 1578. Bartch describes seventy-one of his engravings, and throws light upon the early and very important works of the sixteenth century; they are well drawn and executed with great mastery, much in the style of Marcantonio. Among the most valuable are the Last Judgment, and the Prophets and Sibyls, by Michelangelo, in the Sistine Chapel; and the Dispute on the Sacrament and the School of Athens, after the frescoes by Raphael in the Vatican.

Bartch describes 129 prints by Adalbert Griezzi, called also Manisano; and 46 by Diara Griezzi, called Mantuan. Those of the former are dated from 1566 to 1576, and those of Diana from 1576 to 1588. Diana was the daughter of Joasimiano, the friend of Francesco da Volterra, architect; the date of her death is given 1589.

(Gandellini, Notizia Italiane degli Intagliatori; Bartich, Peintre-Graveur; Brilliot, Dictionnaire des Monogrammes, &c.)

Manuel, Nicolaus, sometimes called Deutsch, a celebrated Swiss painter, was born at Bern, in 1484. He is the Emanuele Tedesco who studied under Titian at Venice about 1511, and he became one of the celebrated painters of forty-six subjects, forty-one of which were the actual Tode- tentzen; it has been long since destroyed, but the compositions are preserved in prints and copies: the wall on which it was painted was pulled down in 1660. Manuel was one of the painters who made the most of the opportunities upon the abuses of the Roman church; he was also a great politician; in 1528 he took an active part in an official capacity in the government of Bern. He died in 1590. His pictures are often seen in private collections in London and Bern. There are a few other of his oil pictures at Basel and at Bern.

Of Nicolaus Manuel, until recently, little was known beyond what Sundelius writes of him in his 'Teutsche Academie.' He appears to have been a man of universal ability; he was painter, sculptor, wood-engraver, poet, soldier, and statesman; and he was lately made the subject of an elaborate work by Dr. Grünlein. After the death of Manuel, Lehmann, Baur, Maders, Richters, Kriegers, Staatsmannes, and Reformerne, Stuttgart and Tubingen, 1837.

(Nagler, Neues Allgemeines Kirchent-Lexicon.)

MAPES, WALTER DE. [GEORGE OF MOSMOUTH, P.C.]

MAPES AND CHARTS. [Copyright, P.C. and P.C.S.]

MARCCELLUS, ULPNIUS, a Roman jurist, who lived under Antoninus Pius and his successors. He was employed by the Senate to draw up the "Decretum Gratian, a single book of Institutions, four books entitled Regularia, two books on Appellations, two books on Plebis Jusicia, a single book in the Digest, a single book in the Pandects, a single book in the Institutes.

MARCUS, CICERON, a Roman jurist, who died in the reign of Commodus, the successor of Aurelius, and by his military success excited the jealousy of the emperor. (Dion Cassius, lxxxii. 8.) But it is doubtful if this Ulpius Marcellus is the jurist. (See the note of Hainmarius on Dion Cassius.)

The writings of Marcellus mentioned in the Florentine Index are thirty-one books of Digests, six books on the Leges Julia et Papia, and two books of Bonsomen. There are 150 excerpts from Marcellus in the Digest; and other works of his are cited besides those just enumerated. Marcellus is quoted by Marciusius, Ulpianus, and Paulus frequently, and by others of a less importance. The dates of his birth and death are unknown.

MARCH, a market and post town in the champaign of March in the parish of Doddington, in the northern division of Withford hundred in the Isle of Ely, Cambridgeshire, 94 miles by road, 72 by the Eastern Counties Railway to Ely, and from thence 20 miles by coach-road through Chatteris to March. The area of Doddington parish is 39,840 statute acres, that of the champaign of March 20,440 acres; the population of the parish in 1841 was 8648, of whom 7076 were in the champaign of March. The population of the champaign at the former enumerations was, in 1801, 2014; 1811, 3069; 1821, 3950; 1831, 5177. The number of houses in the champaign in 1831 was 1024; inhabited, with 1212; inhabited, with 1028 families; 42 unhinherited and 16 building; in 1841 it was 1163 inhabited, 32 uninhabited, and 12 building. In these returns the town is not distinguished from the rural district of the champaign.

The town consists principally of two streets, in the form of the letter T: the street which forms the axis of the letter runs north and south, and is lined with houses on both sides; the cross street runs in an irregular line on the north bank of the old river Nea, having scarcely any houses except on the north side of the street, the south side being for the most part closely skirted by the river, which is crossed by a bridge at the entrance of the town. The church or churchyard, built in 1272, stands at the southern extremity of the town: it is dedicated according to some statements to St. Mary, according to others to St. Wendslea, and is said in some cases to have been erected in the Thirteenth century: it is a handsome Gothic structure, with a spire at the west end. There is a modern and commodious town-hall, where municipal courts are held. The establishment of the grammar school was established in the Isle of Ely for the recovery of debts under 10s. There is a weekly market on Friday for butcher's meat, and there are two yearly fairs. Some trade in agricultural produce is carried on by means of the river Nea, which is navigable.

The champaign of March is united with the vicarage of Doddington; the clear yearly value of the united benefices is 730.5s., with a glebe-house; they are in the rural deanery of Ely, and diocese of Ely. There were in the champaign in 1833 nine day-schools, with 552 children of both sexes, giving not one in nine of the population (according to the census returns) under daily instruction. Two of the schools, with 304 children, were national schools supported by various endowments, and attended by the children on Sunday also; and there were two other Sunday-schools supported by Disendowment with 177 children.

(Ordnance Survey; Parliamentary Papers; Lyons's Magna Britannia.)

MARCIANUS AELIUS, a Roman jurist, who was writing under Antoninus Pius and his successors. He lived near the tomb of the Emperor Divus (Dig. 50, tit. 4, 7). He also survived Caracalla, the successor of Severus, for he names him Divus (Cod. 9, tit. 8, 6). He probably wrote chiefly under the reigns of Septimius Severus and Caracalla, but the works of Marcianus which are mentioned in the Florentine Index are sixteen books of Institutions, four books entitled Regularia, two books on Appellations, two books on Plebis Jusicia, a single book in the Digest, a single book in the Pandects, a single book in the Institutes.

(Translation: "Ignium, nothing is known but one old mention and a quotation. A certain Grecius is mentioned (about A.D. 800) by the Arabic physician whose name is latinized to Menau. John Menau's medical works were translated into Arabic with some success. There is a surmise by Fabrius and Dutens, that this same Grecius is mentioned by Galen. His name first appears, as far as we can find, in Dr. Jebb's edition of Roger Bacon. In speaking (pre- dance, shrewdly) of the art of powdering, a sort of detonating powder, Jebb thinks he may have drawn his account from the Liber Ignium of a certain Marcus Grecus, of which he (Jebb) had seen a manuscript in the possession of Dr. Richard Mead. Dutens, author of 'The Origin des Découvertes attribuées aux Modernes,' procured the account from Dr. Jebb, and ascertained that there was a manuscript in the Royal Library at Paris. But the work has never been published, nor has any notice of it been taken of, that we can find, except such references to Jebb and Dutens as that made by Dr. Hutton. [Bacon, Roger, P.C.] As the passage in question is not easily met with entire, and certainly describes a compost of saltpetre and sulphur, we shall transcribe it, seeing that the early existence of some such thing as gunpowder is clearly indicated, not merely by the passage itself, but by Bacon's reference to it in a similar account:"

'Secondus modus ignis volatilis hoc modo conficitur: lib. ii. sulphuris vivi; lib. ii. carbonis malice; salis potosi vel libros, que tria subtillissimae terrae in lapide marmoreo. Paene salis ad libitum in tunicas repurpatur volatilis vel tonitrum faciens. Nota quod tunc ad volandum debet esse graciola et longa, et predicto pverlo optimo concutacto repleta. Tunc a vel tonitrum faciens debet esse brevissima, grossa, et predicto polvere sone malieta, et ab ea predicto repleta. Nota quod in qualitate tunicas primum foramen fationem est, ut tena imposito accedatur, ut tenea in extremitatis inferi graciola; in medio vero latas, et predicto polvere repleta. Nota quod ad volandum tunicas plascuras ad libitum liberat potest, tonitrum vero faciens quam plurimas plascuras. Nota quod duplex potest facere tonitrum ac duplex volatilis inveniendum, vel tonitrum solubilis in tunicas includendum.'

MARGARITONE D'AREZZO, a celebrated old Italian painter, sculptor, and architect, was born at Arezzo, about 1215, or perhaps a little later, but he was probably at least twenty years older than Cimabue, who was born in 1240.

Margaritone was a pupil of Cimabue, and had charge of the school, and of great reputation in his day. He executed many works in Arezzo, both in temples and in fresco; in the latter style, he painted the ceiling of the church of S. Stefano de Arzincoli, and the walls of the church of the Holy Cross in Arezzo, which was burned by the duke Cosimo de' Medici in 1517, to make room for improvements in the fortifications of Arezzo. Most of Margaritone's works were preserved; but one, which, according to Vasari, Margaritone adorned one of his masterpieces, namely, San Francesco, painted for a convent in Sarziano, still exists, and is engraved in Lastris 'Etruria Piranesii.' I. 7. Vasari speaks highly of a picture on canvas, illustrating the lives of the Virgin and John the Baptist, in small figures, and in which, says Vasari, Margaritone much surpassed his larger works; but this picture has also perished.

There is still an old painted woollen crucifix by Margaritone in the church of Santa Croce at Florence, where it is placed by the side of a similar work by Cimabue. Margaritone's fame was very great in his time, but it was almost wholly eclipsed by the superiority of Cimabue in the use of colour. He was a peculiar way of stretching and priming his canvases; they were primed with plaster mixed with size or glue made of strips of parchement, and were stretched and fastened with the same glue and with tacks.

In sculpture, says Vasari, Margaritone was more successful than in painting. There is still but in, in the cathedral of Arezzo, a reclining marble statue of Gregory X. over the tomb of the same cardinal, to which he was the principal architect. Gregory X. is seated in the chair of the papacy, covered with a long cloak, and in the attitude of prayer, with one hand on the book of the gospels. The lower part of the tomb is also Gregory's painted portrait, but this has been defaced by time: this monument, according to Vasari, is Margaritone's masterpiece.

As an architect, Margaritone conducted the building of the cathedral of Arezzo, some time after the death of Jacopo
a movement of the ruler M N, be placed in coincidence with the zero of the scale (in the middle of the length of the ruler), the triangle must then be moved along M N till the index a is (suppose at a') in contact with the number on the scale which expresses the number of feet in the perpendicular distance between the line drawn and the line A C.

If the triangle be then in the position A' B' C', a line drawn along its edge A' C' will be the line required; for it will be parallel to A C at a distance from it equal to the given number of feet on the natural scale. The reason is manifest; for imagine A'D to be drawn parallel to B C; then the triangle A' D is similar to A B C; consequently, since A A' is equal to the distance a' b' between the two positions of the index, A'D will be the same proportion to a A as b' a' bears to A B; that is, as A'C' to A C.

Lines may be drawn parallel to one another by means of the side B C of the triangle; and it is evident that the distance between them (E C' for example) will bear the same ratio to a A as B' C' to A C; and, therefore, if one of the lines be drawn through the point of contact of the other, the triangle must then be moved along M N till A C passes through the given point; then the line A'C' will be perpendicular to that line.

When lines are to be drawn parallel to one another at considerable distances, the edge B C is made to coincide with an edge M N of the rectangular ruler; and, both ruler and triangle being moved together till A C, then perpendicular to M N, coincides with the given line, the triangle is moved along M N till the same edge A C is at the required distance from the original line; when the line may be drawn.

Marquol's rulers have occasionally been formed and used in a different manner. Instead of one or several scales, a single scale on the ruler M N has been made to serve the purpose by means of several triangles in which the lengths of the sides have different ratios to one another. Thus, a scale of divisions would be made equal to one inch at an edge of M F, and if a right-angled triangle in which the hypotenuse is twice the length of one of the sides is used with it; on sliding the index of the triangle over each division, of about the same length, the triangle is brought to the longer side of the triangle will be the 4th of an inch; if the hypotenuse be four times the length of the shorter side, lines drawn contiguously to the longer side will, on sliding the index over one division of the scale, be equal to the 4th of an inch; and so on.
both occasions declined on private grounds to accept the offer. In June, 1797, John Marshall, Charles Cotesworth Pinckney, and Elbridge Gerry, jointly and severally, were sent to France as envoys extraordinary and ministers plenipotentiary. Marshall returned to America in 1798. In 1799 he became a member of Congress, and on the 19th of May, 1800, was appointed to the Supreme Court. On 18th January, 1801, he succeeded John Jay as chief justice of the United States, and from that time till his death continued to fill the office with disinterested patriotism for ability and integrity. In July 6, 1835, Philadelphia, to which he had gone from his residence in Richmond in Virginia, in hope that by medical advice and change of scene his declining health might be improved, he went; but in his coffin he went穿过了他最年幼的儿子在巴尔的摩，他的旅程去参加他父亲的死亡床。

Judge Marshall was the author of the 'Life of Washington,' originally published in London, in 4 vols. 4to, the first volume in 1804, the fifth in 1807. The work was criticized by the 'Edinburgh Review' (October, 1808) severely, but perhaps not unfairly, as having been swelled out to an unreasonable bulk by historical matter unconnected with the life of Washington; as containing no details of his private character and habits, which Judge Marshall had ample opportunities of knowing; as dilute and undiscriminating in narrative, and hence dull and lifeless in study. This charge seems not to have been thrown away. Marshall published a second edition of the work in 1832, compressed into two volumes, and greatly improved. The 'History of the American Colonies,' which in 1811 comprised the volumes of the original work, he had published in a separate form in 1824.

As a judge, it is admitted that he was one of the most distinguished that America has produced. Judge Story, who was twenty-four years his junior on the bench of the Supreme Court, wrote in 1828 an article in the 'North American Review' (vol. xii.), 'On the Public Services of Judge Marshall,' in which he says.—'Splendid as has been the judicial career of this eminent man, it scarcely possible that the extent of his labours, the vigour of his intellect, or the unerring accuracy of his learning, should be duly estimated except by the profession of which he was so great an ornament.'

Many of those eulogistic judgments which have cost days and nights of the most elaborate study, and for power of thought, of power of illustration, of variety, and elegant demonstrations, are justly numbered among the highest reaches of the human mind, find no admiration beyond the ranks of lawyers, and live only in the dusty repositories of their oracles.'

We emphatically say of Chief Justice Marshall that his master-mind has preceded in our deliberations and arrived at the results of cogency of reasoning, a depth of remark, a persuasiveness of argument, a clearness and elaboration of illustration, and an elevation and comprehensiveness of conclusion, to which none others offer a parallel.'

(Marshman, Joshua, D.D. [Skarnsor Missi on, P. C. S.]

MARTINO. [Memma di Martino, Simone, P. C. S.]

MARTY, SAINI, the easternmost of the Azores or Western Islands, and lies near 37° N. lat. and 25° W. long. It is about seven miles in length from east to west, and five miles in breadth from north to south, and contains an area of 36 square miles, or 27,000 acres. The island consists of a plain and an elevated district. The plain occupies about one-third part on the west side of the island, the other part being formed of an elevated ridge running from north-west to south-east, which rises to a double peak (Pico Alto) 1889 feet above the sea, and of which the sides decline on the north, east, and south to molar cliffs, about 200 feet in height, with which it terminates on the shore. The plain is slightly undulating, and like the higher tract cut by ravines, terminating in cliffs more than 100 feet high. The aspect of St. Mary is therefore on all sides bold, and the coast abrupt or precipitous, and surrounded by the usual accumulations of fallen masses.

The surface on the west side is much overlaid with stones, and bears a sparse vegetation of grasses and weeds. The most elevated parts of the other ground are covered with common heath and some other shrubs; on the east side only is there any land which is fit for cultivation. The cultivation is limited to wheat, Indian corn, potatoes, and beans and peas. There are few trees, but those of cedars, and those of oranges have been largely increased. Aloes and the prickly-pear cactus grow wild, and the Rocella tinctoria to a large size. Nothing is known respecting the climate of the island. There is much less rain in this island than in that of St. Michael's. The population, according to the census of 1840, was composed of 4666 individuals, of whom about one-half belonged to the smallest of the Azores, and the remainder were dispersed over the island in single farm-houses. There were then 2213 males and 2453 females. There are some public schools, established by government, but in 1840 they were only attended by fifteen-two pupils, all males. The course of education does not comprehend more than the elements of reading and writing.

The whole quantity of agricultural produce is comprised in about 2000 quintals, the produce of which is mainly consumed in the following articles: boxes of oranges, and a small quantity of wine, potatoes, beans, peas, and other articles. About one-half of the wheat and all the oranges are exported to St. Michael's. This product was raised under the care of her mother the Neupil, and the year is sterile. The greater part of the western plain is only fit for pasturage. There are about 2800 head of horned cattle, 3000 sheep, 1200 pigs, 600 goats, and 100 horses and asses. It was at an age to benefit by the instruction of Philippe commanded some of the most skilful artists in their several styles to attend upon her. Any Scheffer was her master in design and painting, Pierre Jean David instructed her in modelling sculpture, and Jean Baptiste Lemaire taught her drawing in water-colours. She was married to the Duke of Würtemberg in 1837, and she died at Pisa, in January, 1849, in consequence of injuries suffered from the ascendant fever, which then besat St Geniez.

She is said to have left numerous designs, and to have executed many beautiful drawings. Some of her works in sculpture have already acquired her a European reputation; among these her marble statue of Joan of Arc is the most popular. Joan is standing with her eyes fixed upon the ground in deep meditation, her arms are crossed upon her breast, and in her right hand she grasps her sword; her costume is that of a female and a knight combined. The original statue, now at Versailles, is of the size of life, but it has been copied in many materials and in many sizes. She executed also an equestrian statue of Joan of Arc at the moment when having slain an Englishman with her battle-axe: there is also a small model by her of the Death of the Chevalier Bayard. And in a chapel at Fontainebleau there are some windows painted after her designs. Many contemporary journals, French and foreign, celebrated the character and ability, and depicted the urniitute fate of this accomplished princess.

MARYGOLD. [Callsefchia, F. C. S.]

MASCARA. [Adriano, F. C. P., p. 390.]

MASCIE, L. (Lorenzo, Island mathematician), was born at Bergamo in 1750. His studies were at first directed to the languages and literature of Greece and Rome, and to these subjects he applied himself with unwearied diligence. At the age of five years he was appointed professor of humanity in the university of his native city, and he attracted some notice at that time by a poetical dissertation on what he called the false eloquence of the pulpit. He afterwards became professor of Greek in the university of Pavia; and,
MAS

MAS

having taken orders in the church, he acquired the title of Abbé.

Bishop was not till he was twenty-seven years of age that he began the study of mathematics; but he rapidly acquired a taste for the sciences, which induced him to abandon his classical pursuits, and so great was his progress in this branch of the study, that he obtained professor of geometry in the college Mariano at Bergamo.

When the Revolution took place in the north of Italy, on the invasion of the country by the French, Mascheroni was chosen a member of the legislative body in the Cisalpine Republic; and soon afterwards he was sent to Paris to assist in the formation of the new system of weights and measures. He was at one time also engaged at Bologna, with other mathematicians, in the construction of a watch. He also spent some time in view of proving the rotation of the earth on its axis by the place at which a body struck the ground when let fall from the upper part of a lofty building.

Mascheroni published in 1804, a work entitled 'Sulle Curve che servono a delineare le Orec Ineguali degli Antichi nelle superficie Plane,' Bergamo, 1804; and in the following year, at the same place, a tract, also in Italian, on the Equilibrium of Vails, 4to. In this tract the higher branches of analysis are employed, and the investigations are extended to subjects beyond those which are treated in the works of the earlier writers on the applications of science to practical engineering. It contains also a number of problems in geometry.

'Geometria del Compasso,' in which are ingenious solutions of several geometrical propositions by means of a pair of compasses only; that is, by the intersection of circular arcs, without a straight line, and which is sufficient for finding points in lines perpendicular or parallel to, or making given angles with, a line joining two points whose positions are assigned; of determining a mean proportional between two lines; of drawing polygons in circles. There are also approximate solutions of problems, such as the duplication or multiplication of a cube, and the trisection of an angle, which require, in the usual method of operating, applications of the cubic sections or other curves.

Besides the mathematical works just mentioned, and a tract containing notes on Euler's 'Institutiones Calculi Differentialis,' Mascheroni published some verses which were addressed to the Countess Grismond, an elegy on the death of Borda, and a poem entitled 'Iavio di Dafni a Leasia,' in which he introduced a precise description of the objects contained in the museum. He afterwards directed the army in Italy, and, as a reward of his services, was appointed to the command of the army of Napoleon on the 18th of February, 1804, and were the real conquerors of the island, and which Mascheroni had the merit of placing in a new light.

(Biographie Universelle; Montucla, Hist. des Mathématiques.)

MASSENA, ANDRE, Prince of Exilles, Duke of Rivoli, and Marshal of France, was born at Nice, 6th May, 1758. 'Several of the French marshals,' says D'Arriécli, 'and the most famous—Masséna, for example—was a Jew; his real name was Massunis.' (Cormingy, ii. 203.) Left an orphan at an early age, his education was greatly neglected. He appears to have spent some years of his youth at sea with a relation who was a captain of a trading vessel, but having taken a dislike to a sea-going life, he abandoned it, and in 1775 entered the army as a private soldier in the regiment Royal Italian, in which one of his uncles was a captain. After a diligent discharge of his duties in that regiment for fourteen years, he only attained the rank of corporal, which, when he afterwards became marshal, he declared was the step in his military career which had cost him the most to gain. Discouraged by this slow promotion, he retired to his native city, where he remained for some time, and then accompanied the French revolution recalled him to his former profession, and he was appointed by the so-called of his fellow-soldiers to the rank of adjutant-major of the battalion raised in the adopt the title of Duke of Exilles, which was soon afterwards confirmed. In August, 1793, he was made general of brigade, and general of division a few months after. In the Italian campaigns of 1794 and 1795 he served under the generals Walleran and Schérer, and it was chiefly owing to his skill as a tactician that the victory was gained in the Battle of Legnano (August, 1794), and on the Col de San Gianni in 1794. It is asserted that Masséna has generally been attributed to the ability of the plans which the influence of his talents caused to be adopted. When Napoleon assumed the command of the army in Italy he employed Masséna in the most important, and the brilliancy of whose military conceptions he so justly appreciated, that he summoned him the 'favoured child of victory.' The scenes of his principal exploits were Montenotte (1 and 2 April, 1796), Montenotte (14 April), Castiglione (30 June—5 July), Arcola (15—17 Nov.), and Rivoli (9 January, 1797).

At the peace of Campo Formio, October 17, 1797, Masséna was sent to France to present to the Directory the ratification of the peace of the 14th of November. In February, 1798, he was appointed to the command of the army which, under General Béthisy, was occupying Rouen and the Papal States. His appointment to this office was equally disliked both by the French soldiers and the inhabitants of the subject country, for they both became the victims of that insatiable avarice which on every occasion characterized this general. The multiplied complaints which his disposition gave rise to at last obliged him to resign his command and to return to Paris. He there published 'Un Mémoire' in justification of his conduct, notwithstanding which he was left without employment till 1799, when the important command of the army of Italy was confided to him. In the direction of this campaign he evinced a military talent of the highest order. The memorable battle of Zürich (5th and 6th of June, 1799), in which he obtained the victory over Rossbach, who, with a very superior force, not only drove the English from the town and its environs, but also defeated the Austrians, was a signal victory for the French arms, and finally decided the event of the war in favour of the French, who, under the able leadership of the French generals, were now able to maintain their superiority over the enemy, and to make good their conquests.

In 1799, he was again appointed to the command of the army of Italy, and was ordered to advance under the Archduke Charles: he conducted this campaign with varying success, but he was at last enabled to drive back the Austrians into Germany, and to effect a junction with the French army of the Rhine. After the battle of the Nations (20th Oct., 1799), Masséna had the command of the army which was to conduct Joseph Bonaparte [Bonaparte, Joseph, P. C. S.] to Naples, which kingdom had been bestowed upon him by his brother (from whence he returned after having established by force of arms the authority of the new king). By his success over the insurgent Calabrians and the redaction of the fortress of Gaeta (18th June, 1800), he enabled Joseph to take possession of his new kingdom. In 1807 he was appointed to the command of the right wing of the army opposed to the Russians in Poland, and his services during this important campaign were rewarded by the title of Duke of Rivoli, in commemoeration of the skill and bravery which he had displayed in that celebrated battle (1797) [Rivoli, P. C. J.; a large sum of money was at the same time given him to support his new dignity.

A singular and untoward circumstance occurred on his return to Paris. He, who had exposed his person in so many battles without receiving a wound, had the misfortune to lose the sight of his left eye while on a hunting-party, a portion of shot having been put accidentally into it.
